PREFACE

a In this Statement, the Board recommends accounting standards for selected assets and liabilities. The assets are cash, fund balance with Treasury, accounts receivable, interest receivable, advances and prepayments, and investments in Treasury securities. The liabilities are accounts payable, interest payable, and other current liabilities.

b The Board's focus in this Statement is on setting accounting standards for the individual federal entity, the level at which financial statements are often prepared. A federal entity, as the term is used in this document, is a unit within the federal government, such as a department, agency, bureau, or program. An entity also encompasses a group of related or unrelated commercial functions, revolving funds, trust funds, and/or other accounts. The standards proposed in this Statement are applicable to federal entities performing either governmental or commercial-type functions and to the federal government as a whole, unless otherwise noted.

c The recommended standards distinguish between intragovernmental and governmental assets and liabilities. An entity may have intragovernmental assets and liabilities that arise from transactions among entities within the federal government. Intragovernmental assets represent claims of an entity of the federal government against other federal entities. Intragovernmental liabilities are amounts that a federal entity owes to other federal entities. An entity may also have governmental assets and liabilities that arise from transactions with entities outside the federal government. Governmental assets are claims of the federal government or an entity within the federal government against nonfederal entities. Governmental liabilities are amounts that the federal government or an entity within the federal government owes to nonfederal entities.

d The standards recommended in this Statement were previously proposed in the Exposure Draft, Financial Resources, Funded Liabilities, and Net Financial Resources of Federal Entities, November 18, 1991. Comments were

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

received from sixty-nine organizations and individuals. Comments also were presented to the Board at a public hearing on February 28, 1992. The Board considered the comments and incorporated changes, as appropriate. Substantive comments and changes adopted are discussed in Appendix A, Basis of the Board's Conclusions.

e The FASAB recommends that, if the Principals approve the accounting standards recommended in this Statement, they become effective for fiscal years ending September 30, 1994, and thereafter.

****

INTRODUCTION

OBJECTIVE

1 In this Statement, the Board recommends accounting standards for selected assets and liabilities of the federal government and its entities. The standards apply to both governmental and commercial-type functions of the federal government.

2 The selected assets and liabilities are among the fundamental elements of federal accounting and financial reporting. By recommending these standards in the Board's first Statement, the Board's objective is to provide definitive accounting and reporting guidance to federal agencies in these fundamental areas at the earliest stage of the Board's consideration and development of federal accounting standards.

3 In a separate project, the Board is identifying users' needs and federal accounting and reporting objectives. Although the Board's deliberation on objectives has not been finalized, there is a general consensus that one overall objective for accounting and financial reporting is to assure accountability of federal government entities. The Board believes that issuing these selected standards will help in fostering that overall objective.

4 Specifically, the recommended standards would assist users of financial statements in:

-- assessing the efficiency and effectiveness of the government's management of its assets and

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

liabilities, and

-- determining whether the government's financial position improved or deteriorated over the reporting period.

APPROACH

5 The Board's initial approach to developing accounting standards was to review the existing accounting standards prescribed by the General Accounting Office (GAO) in its "Policy and Procedures Manual for the Guidance of Federal Agencies," Title 2 Accounting, (Title 2). The purpose of the review was to determine whether some of the <MI>Title 2<M> standards, with any necessary modifications, could be recommended by the Board to the principals of the Joint Financial Management Improvement Program (JFMIP).

6 Although the Title 2 standards had not been fully implemented by federal agencies, they represented a starting point for further analysis. The Title 2 standards were reviewed in light of the accounting and reporting requirements established in the Chief Financial Officers (CFOs) Act of 1990. At the same time, the Board considered current accounting practices of federal agencies. It also considered the findings from its project on user needs and objectives of federal financial reporting. As a result of the review, the Board decided that with certain modifications, accounting standards for selected assets and liabilities could be recommended to the JFMIP principals.

7 These selected assets and liabilities involve less complex issues than other assets and liabilities to be considered by the Board in the future. The Board also believes that the selected assets and liabilities are so basic to financial reporting that they will not conflict with any conceptual framework that the Board may develop.[Footnote 1.]

[Footnote 1: The Board is also addressing other assets and liabilities. It has issued a proposed standard for direct loans and loan guarantees (see Exposure Drafts entitled Accounting for Direct Loans and Loan Guarantees, September 15, 1992, and Accounting for Inventory and Related Property, December 1992).]

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

8 The standards on the selected assets and liabilities were proposed in the Board's first Exposure Draft issued in September 1991, entitled Financial Resources, Funded Liabilities, and Net Financial Resources of Federal Entities. A total of 69 respondents submitted their comments to the Board on the Exposure Draft. A public hearing on the Exposure Draft was held on February 28, 1992.

9 In preparing this Statement of recommended standards, the Board considered the respondents' comments. Based on the comments the Board received and its reevaluation in relation to the Board's current thinking on user needs and objectives of federal financial reporting, the Board made changes to the proposals contained in the Exposure Draft. The specific changes are discussed in Appendix A, "Basis of the Board's Conclusions."

SCOPE

10 The selected assets addressed in this Statement are:

- Cash
- Fund Balance with Treasury
- Accounts Receivable
- Interest Receivable
- Advances and Prepayments
- Investments in Treasury Securities

11 The selected liabilities addressed in this Statement are:

- Accounts Payable
- Interest Payable
- Other Current Liabilities

MATERIALITY

12 Except as otherwise noted, the accounting and reporting provisions of the accounting standards recommended in this Statement need not be applied to items that are qualitatively and quantitatively immaterial.

13 The determination of whether an item is material depends on the degree to which omitting or misstating information about the item makes it probable that the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

judgment of a reasonable person relying on the information would have been changed or influenced by the omission or the misstatement.

APPLICABILITY

14 The accounting standards recommended in this Statement are applicable to the federal government and its departments and agencies in the executive branch that fall within the definition of executive agency as defined in 31 U.S.C. 102 and 3501.

EFFECTIVE DATE

15 The FASAB recommends that, if the Principals approve the accounting standards recommended in this Statement, they become effective for fiscal years ending September 30, 1994, and thereafter.

EXPLANATION

16 The Board's focus in this Statement is on setting accounting standards for the individual federal entity level of reporting. In this Statement, the standards are also applicable to financial reporting by the U.S. government as a whole, except for those standards related to intragovernmental assets and liabilities, which are defined in the general standards and noted in specific standards.

17 The word entity refers to a unit within the federal government, such as a department, agency, bureau, or program, for which a set of financial statements will be prepared. The word entity also encompasses a group of related or unrelated commercial functions, revolving funds, trust funds, and/or other accounts for which financial statements are prepared in accordance with OMB guidance on the form and content of financial statements.

GENERAL STANDARDS

Intragovernmental vs. Governmental Assets and Liabilities

INTRAGOVERNMENTAL ASSETS AND LIABILITIES 18 arise from transactions among federal entities. Intragovernmental

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

assets are claims of a federal entity against other federal entities. Intragovernmental liabilities are claims against the entity by other federal entities.

19 Among the assets covered by this Statement, intragovernmental assets include an entity's fund balance with Treasury, investments in Treasury securities, accounts and interest receivable from federal entities, and advances and prepayments to federal entities.

20 Intragovernmental liabilities include accounts and interest payable to federal entities and other current liabilities due to federal entities, such as receipt of federal advances and prepayments.

GOVERNMENTAL ASSETS AND LIABILITIES 21 arise from transactions of the federal government or an entity of the federal government with nonfederal entities. Governmental assets are claims of the federal government or an entity within the federal government against nonfederal entities. Governmental liabilities are amounts that the federal government or an entity within the federal government owes to nonfederal entities. The term nonfederal entities encompasses domestic and foreign persons and organizations outside the U.S. government. The term public is also used in this Statement to represent nonfederal entities.

22 Among the assets covered by this Statement, governmental assets that would be reported by a federal entity include cash, accounts and interest receivable from nonfederal entities, and advances and prepayments made to nonfederal entities.

23 Governmental liabilities include accounts and interest payable to nonfederal entities, other liabilities due to nonfederal entities, and advances and prepayments received from nonfederal entities.

24 Intragovernmental assets and liabilities should be reported separately from governmental assets and liabilities. This requirement applies to all of the selected assets and liabilities addressed in this document.

Entity Assets vs. <R>Non-entity Assets

ENTITY ASSETS 25 are those assets which the reporting

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

entity has authority to use in its operations."Non-entity assets" are those assets that are held by an entity but are not available to the entity. An example of non-entity assets are customs duty receivables that the Customs Service collects for the U.S. government but has no authority to spend. A similar example is federal income tax receivable that the Internal Revenue Service collects for the U.S. government.

26 Both entity assets and non-entity assets under an entity's custody or management should be reported in the entity's financial statements. Non-entity assets reported in an entity's financial statements should be segregated from entity assets. An amount equal to non-entity assets should be recognized as a liability (due to Treasury or other entities) in the entity's financial statements.

SPECIFIC STANDARDS

Cash

27 Cash, including imprest funds, should be recognized as an asset. Cash consists of:

(a) coins, paper currency and readily negotiable instruments, such as money orders, checks, and bank drafts on hand or in transit for deposit;

(b) amounts on demand deposit with banks or other financial institutions; and

(c) foreign currencies, which, for accounting purposes, should be translated into U.S. dollars at the exchange rate on the financial statement date.

ENTITY CASH. 28 Entity cash is the amount of cash that the reporting entity holds and is authorized by law to spend.

NON-ENTITY CASH. 29 Non-entity cash is cash that a federal entity collects and holds on behalf of the U.S. government or other entities. In some circumstances, the entity deposits cash in its accounts in a fiduciary capacity for the U.S. Treasury or other entities. Non-entity cash should be reported separately from entity cash.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

Restricted cash. 30 Cash may be restricted. Restrictions are usually imposed on cash deposits by law, regulation, or agreement. Non-entity cash is always restricted cash. Entity cash may be restricted for specific purposes. Such cash may be in escrow or other special accounts. Financial reports should disclose the reasons and nature of restrictions.

Fund Balance with Treasury

31 A federal entity's fund balance with the Treasury is the aggregate amount of funds in the entity's accounts with Treasury for which the entity is authorized to make expenditures and pay liabilities. Fund balance with Treasury is an intragovernmental item. From the reporting entity's perspective, a fund balance with Treasury is an asset because it represents the entity's claim to the federal government's resources. However, from the perspective of the federal government as a whole, it is not an asset; and while it represents a commitment to make resources available to federal departments, agencies, programs and other entities, it is not a liability.

32 A federal entity's fund balance with Treasury includes clearing account balances and the dollar equivalent of foreign currency account balances. Foreign currency account balances should be translated into U.S. dollars at exchange rates determined by the Treasury and effective at the financial reporting date. A federal entity's fund balance with Treasury <R>also includes balances for direct loan and loan guarantee activities held in the credit reform program, financing, and liquidating accounts.

33 An entity's fund balance with Treasury is increased by (a) receiving appropriations, reappropriations, continuing resolutions, appropriation restorations, and allocations, and (b) receiving transfers and reimbursements from other agencies. An entity's fund balance with Treasury is also increased by amounts borrowed from Treasury, Federal Financing Bank, or other entities, and amounts collected and credited to appropriation or fund accounts that the entity is authorized to spend or use to offset its expenditures.

34 An entity's fund balance with Treasury does not include contract authority or unused authority to borrow. Contract authority is a statutory authority under which

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

contracts or other obligations may be entered into prior to receiving an appropriation for the payment of obligations. The later enacted appropriation provides cash to liquidate obligations. [Footnote 2] Thus, contract authority merely permits a federal entity to incur certain obligations but does not, in itself, add funds to the agency's accounts with Treasury.
[Footnote 2: Source of definition: OMB Circular A-34.]

35 Authority to borrow is a statutory authority that permits a federal agency to incur obligations and make payments for specific purposes out of borrowed funds. Authority to borrow adds funds to an agency's accounts with Treasury only after the agency actually uses the authority to borrow a specific amount of funds. Thus, authority to borrow is included in an entity's <R>fund balance with Treasury only to the extent that funds are actually borrowed under the authority.

36 An entity's fund balance with Treasury is reduced by (a) disbursements made to pay liabilities or to purchase assets, goods, and services, (b) investments in U.S. securities (securities issued by Treasury or other federal government agencies), (c) cancellation of expired appropriations; (d) transfers and reimbursements to other entities or to the Treasury, and (e) sequestration or rescission of appropriations.

37 Disclosure should be made to distinguish two categories of funds within the entity's fund balance with Treasury: the obligated balance not yet disbursed and the unobligated balance. The obligated balance not yet disbursed is the amount of funds against which budgetary obligations have been incurred, but disbursements have not been made.

38 The unobligated balance is the amount of funds available to an entity against which no claims have been recorded. Unobligated balances are generally available to a federal entity for specific purposes stipulated by law. Unobligated balances may also include balances in expired/canceled accounts that are available only for approved adjustments to prior obligations. Certain unobligated balances may be restricted to future use and are not apportioned for current use. Disclosure should be provided on such restrictions.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

39 Federal entities should explain any discrepancies between fund balance with Treasury in their general ledger accounts and the balance in the Treasury's accounts and explain the causes of the discrepancies in footnotes to financial statements. (Discrepancies due to time lag should be reconciled and discrepancies due to error should be corrected when financial reports are prepared.) Agencies also should provide information on unused funds in expired appropriations that are returned to Treasury at the end of a fiscal year.

Accounts <R>Receivable

40 Accounts receivable arise from claims to cash or other assets. The accounting standard for accounts receivable is set forth below.

RECOGNITION OF RECEIVABLES. [Footnote 3] 41 A receivable should be recognized when a federal entity establishes a claim to cash or other assets against other entities, either based on legal provisions, such as a payment due date (e.g., taxes not received by the date they are due), or goods or services provided. If the exact amount is unknown, a reasonable estimate should be made.

[Footnote 3: The word recognition used in this document bears the same meaning as used by the Financial Accounting Standards Board (FASB) in its conceptual statements. It means the process of formally recording or incorporating an item into the financial statements of an entity as an asset, liability, revenue, expense, or the like. A recognized item is depicted in both words and numbers, with the amount included in the statement totals. Recognition comprehends both initial recognition of an item and recognition of subsequent changes in or removal of a previously recognized item. FASB Statement of Financial Accounting Concepts No. 5, par. 6.]

SEPARATE REPORTING. 42 Receivables from federal entities are intragovernmental receivables, and should be reported separately from receivables from nonfederal entities.

ENTITY VS. NON-ENTITY RECEIVABLES. 43 Receivables should be distinguished between entity receivables and non-entity receivables. "Entity receivables" are amounts

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

that a federal entity claims for payment from other federal or nonfederal entities and that the federal entity is authorized by law to include in its obligational authority or to offset its expenditures and liabilities upon collection.[Footnote 4] Non-entity receivables are amounts that the entity collects on behalf of the U.S. government or other entities, and the entity is not authorized to spend. [Footnote 5] > Receivables not available to an entity are non-entity assets and should be reported separately from receivables available to the entity.
[Footnote 4: An entity may have receivables that, once collected, can be used as offsets to the entity's budget authority and outlays only when authorized by Congress. Before receiving the authorization, however, those receivables are non-entity receivables.]

[Footnote 5: Governmental receipts include collections arising from the sovereign and regulatory powers unique to the federal government, e.g., income tax receipts, customs duties, court fines, certain license fees, etc. A federal entity may be responsible for collecting these receipts on behalf of the U.S. government, but is not authorized to use the monies collected to offset its expenditures.]

RECOGNITION OF LOSSES DUE TO UNCOLLECTIBLE AMOUNTS. 44 Losses on receivables should be recognized when it is more likely than not that the receivables will not be totally collected. The phrase more likely than not means more than a 50 percent chance of loss occurrence.

45 An allowance for estimated uncollectible amounts should be recognized to reduce the gross amount of receivables to its net realizable value.[Footnote 6] The allowance for uncollectible amounts should be reestimated on each annual financial reporting date and when information indicates that the latest estimate is no longer correct.

[Footnote 6: In the Board's Exposure Draft, Accounting for Direct Loans And Loan Guarantees, September 15, 1992, receivables are accounted for on a net present value basis.]

Measurement of losses. 46 Losses due to uncollectible amounts should be measured through a systematic methodology. The systematic methodology should be based on analysis of

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

both individual accounts and a group of accounts as a whole.

Individual account analysis. 47 Accounts that represent significant amounts should be individually analyzed to determine the loss allowance. Loss estimation for individual accounts should be based on (a) the debtor's ability to pay, (b) the debtor's payment record and willingness to pay, and (c) the probable recovery of amounts from secondary sources, including liens, garnishments, cross collections and other applicable collection tools.

48 The allowance for losses generally cannot be based solely on the results of individual account analysis. In many cases, information may not be available to make a reliable assessment of losses on an individual account basis or the nature of the receivables may not lend itself to individual account analysis. In these cases, potential losses should be assessed on a group basis.

Group analysis. 49 To determine the loss allowance on a group basis, receivables should be separated into groups of homogeneous accounts with similar risk characteristics.

50 The groups should reflect the operating environment. For example, accounts receivable can be grouped by: (a) debtor category (business firms, state and local governments, and individuals), (b) reasons that gave rise to the receivables (tax delinquencies, erroneous benefit payments, trade accounts based on goods and services sold, and transfers of defaulted loans to accounts receivable), or (c) geographic regions (foreign countries, and domestic regions). Within a group, receivables are further stratified by risk characteristics. Examples of risk factors are economic stability, payment history, alternative repayment sources, and aging of the receivables.

51 Statistical estimation by modeling or sampling is one appropriate method for estimating losses on groups of receivables. Statistical estimation should take into consideration factors that are essential for estimating the level of losses, including historical loss experience, recent economic events, current and forecast economic conditions, and inherent risks.

Disclosure. 52 Agencies should disclose the major categories of receivables by amount and type, the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

methodology used to estimate the allowance for uncollectible amounts, and the total allowance.

Interest <R>Receivable

53 Interest receivable should be recognized for the amount of interest income earned but not received for an accounting period. Interest receivable should be recognized as it is earned on investments in interest-bearing securities. Interest also should be recognized on outstanding accounts receivable and other U.S. government claims against persons and entities in accordance with provisions in 31 U.S.C. 3717, Interest and Penalty Claims. (See also Federal Claims Collection Standards, 4 CFR Part 103, paragraph 102.13.)[Footnote 7]

[Footnote 7: Accounting for imputed interest, interest on long-term leases, interest on loans, and interest on amounts deposited in credit reform accounts will be addressed when the Board considers accounting standards in these areas.]

54 No interest should be recognized on accounts receivable or investments that are determined to be uncollectible unless the interest is actually collected. Payments received from the debtor are required to be applied first to penalty and administrative cost charged, second to interest receivable, and third to outstanding debt principal, per Federal Claims Collection Standards, 4 C.F.R. 102.13(f).

55 However, until the interest payment requirement is officially waived by the government entity or the related debt is written off, interest accrued on uncollectible accounts receivable should be disclosed.

56 Interest receivable from federal entities should be accounted for and reported separately from interest receivable from the public.

Advances and Prepayments

57 Advances are cash outlays made by a federal entity to its employees, contractors, grantees, or others to cover a part or all of the recipients' anticipated expenses or as advance payments for the cost of goods and services the entity acquires. Examples include travel advances disbursed

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

to employees prior to business trips, and cash or other assets disbursed under a contract, grant, or cooperative agreement before services or goods are provided by the contractor or grantee.

58 Prepayments are payments made by a federal entity to cover certain periodic expenses before those expenses are incurred. Typical prepaid expenses are rents paid to a lessor at the beginning of a rental period. Progress payments made to a contractor based on a percentage of completion of the contract are not advances or prepayments.

59 Advances and prepayments should be recorded as assets. Advances and prepayments are reduced when goods or services are received, contract terms are met, progress is made under a contract, or prepaid expenses expire. A travel advance, for example, should be initially recorded as an asset and should be subsequently reduced when travel expenses are actually incurred. Amounts of advances and prepayments that are subject to refund (for example, a settled travel claim indicating the traveler owes part of the advance to the government) should be transferred to accounts receivable.

60 Advances and prepayments paid out by an entity are assets of the entity. On the other hand, advances and prepayments received by an entity are liabilities of the entity (see the recommended standard for other current liabilities). In financial reports of an entity, advances and prepayments the entity paid out (assets) should not be netted against advances and prepayments that the entity received (liabilities).

61 Advances and prepayments made to federal entities are intragovernmental items and should be accounted for and reported separately from those made to nonfederal entities.

Investments in Treasury Securities

Scope. 62 This standard applies to investment by federal entities in Treasury securities, including (a) nonmarketable par value Treasury securities, (b) market-based Treasury securities expected to be held to maturity, and (c) marketable Treasury securities expected to be held to maturity. This standard does not apply to investments by federal entities in securities (debt and

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

equity) and other financial instruments issued by other than the U.S. Treasury.

63 Nonmarketable par value Treasury securities are special series debt securities that the U.S. Treasury issues to federal entities at face value (par value). The securities are redeemed at face value on demand; thus investing entities recover the full amounts invested.

64 Market-based Treasury securities are debt securities that the U.S. Treasury issues to federal entities without statutorily determined interest rates. Although the securities are not marketable, their terms (prices and interest rates) mirror the terms of marketable Treasury securities.

65 Marketable Treasury securities, including Treasury bills, notes, and bonds, are initially offered by Treasury to the marketplace and can then be bought and sold on securities exchange markets. Their bid and ask prices are publicly quoted by the marketplace.

Treasury securities expected to be held to maturity. 66 Aside from nonmarketable par value Treasury securities, this standard applies to market-based and marketable Treasury securities that are expected to be held to maturity. An investment in securities is expected to be held to maturity only if the investing entity has the intent and ability to hold those securities to maturity. An investment in Treasury securities should not be considered as expected to be held to maturity if the investing entity is likely to sell the securities in response to short-term cash needs, changes in market interest rates, or for other reasons.

Separate accounting and reporting for federal and

nonfederal securities. 67 Investments of a federal entity in U.S. securities (securities issued by Treasury and federal agencies) are intragovernmental investments. These U.S. securities also represent intragovernmental liabilities of the Treasury Department or other federal entities that issue the securities. Investments in securities issued by the U.S. Treasury or other federal entities should be accounted for and reported separately from investments in securities issued by nonfederal entities.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

Initial recording. 68 The three types of Treasury securities covered by this standard (nonmarketable par value Treasury securities, market-based Treasury securities expected to be held to maturity, and marketable Treasury securities expected to be held to maturity) should be recognized at their acquisition cost. If the acquisition is made in exchange for nonmonetary assets, the acquired securities should be recognized at the fair market value of either the securities acquired or the assets given up, whichever is more definitively determinable.

69 If the acquisition cost differs from the face (par) value, the security should be recorded at the acquisition cost, which equals the security's face value plus or minus the premium or discount on the investment. A discount is the excess of the security's face amount over its purchase price. A premium is the excess of the purchase price over the security's face value. The balance in the valuation account is treated as a contra account to the debt security.

Valuation subsequent to acquisition. 70 Subsequent to their acquisition, investments in Treasury securities should be carried at their acquisition cost, adjusted for amortization, if appropriate, as explained below.

71 If an amount of premium or discount exists, the carrying amount of the investments should be adjusted in each reporting period to reflect the amortization of the premium or the discount. Premiums and discounts should be amortized over the life of the Treasury security using the interest method. Under the interest method, the effective interest rate (the actual interest yield on amounts invested) multiplied by the carrying amount of the Treasury security at the start of the accounting period equals the interest income recognized during the period (the carrying amount changes each period by the amount of the amortized discount or premium). The amount of amortization of discount or premium is the difference between the effective interest recognized for the period and the nominal interest for the period as stipulated in the Treasury security. (See Appendix B for an illustration of the interest method of amortization.)

Disclosure of market value. 72 For investments in market-based and marketable Treasury securities, the market

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

value of the investments should be disclosed. For purposes of determining a market value, investments should be grouped by type of security, such as marketable or market-based Treasury securities. The market value of investments in a group is calculated by the market price of securities of that group at the financial reporting date multiplied by the number of notes or bonds held at the financial reporting date.

Investment reclassification. 73 In rare instances, significant unforeseeable circumstances may cause a change in an entity's intent or ability to hold to maturity certain securities that are initially classified as expected to be held to maturity. In these circumstances, the affected securities should be reclassified as securities available for sale or early redemption (redemption before the security's maturity). Once a security is reclassified it is no longer subject to this standard.

Accounts Payable

74 Accounts payable are amounts owed by a federal entity for goods and services received from, progress in contract performance made by, and rents due to other entities.

75 Accounts payable are not intended to include liabilities related to on-going continuous expenses such as employees' salary and benefits, which are covered by other current liabilities. (See recommended standard for Other Current Liabilities.)

76 Amounts owed for goods or services received from federal entities represent intragovernmental transactions and should be reported separately from amounts owed to the public.

77 When an entity accepts title to goods, whether the goods are delivered or in transit, the entity should recognize a liability for the unpaid amount of the goods. If invoices for those goods are not available when financial statements are prepared, the amounts owed should be estimated.

78 When a contractor provides the government with goods that are also suitable for sale to others, the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

liability usually arises when the contractor physically delivers the goods and the government receives them and takes formal title. However, when a contractor builds or manufactures facilities or equipment to the government's specifications, formal acceptance of the products by the government is not the determining factor for accounting recognition. Constructive or de facto receipt occurs in each accounting period, in accordance with the following paragraph.

79 For facilities or equipment constructed or manufactured by contractors or grantees according to agreements or contract specifications, amounts recorded as payable should be based on an estimate of work completed under the contract or the agreement. The estimate of such amounts should be based primarily on the federal entity's engineering and management evaluation of actual performance progress and incurred costs.

80 The reporting entity should disclose accounts payable not covered by budgetary resources.

Interest Payable

81 Interest payable should be recorded for the amount of interest expense incurred and unpaid. Interest incurred results from borrowing funds from Treasury, Federal Financing Bank, other federal entities, or the public. Interest also should be recorded on late payment of bills by the federal entity (see provisions in 31 U.S.C. 3901 through 3907, Prompt Payment) and on refunds <R>(see provisions in 26 U.S.C. 6611). Interest payable of an entity on borrowed funds and unpaid bills should be recognized at the end of each period.

82 Interest payable to federal entities is an intragovernmental liability and should be accounted for separately from interest payable to the public.

Other Current<R> Liabilities

83 The term other current liabilities is used to report current liabilities that are not recognized in specific categories such as accounts payable; interest payable; debt owed to the public, Treasury, or other entities; and liabilities for loan guarantee losses. Other

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

current liabilities may include unpaid expenses that are accrued for the fiscal year for which the financial statements are prepared and are expected to be paid within the fiscal year following the reporting date.

84 Typical examples of other current liabilities to be recognized are: (a) accrued employees' wages, bonuses, and salaries for services rendered in the current fiscal year for which paychecks will be issued in the following year; (b) accrued entitlement benefits payable, such as Old Age Survivors Insurance (OASI) and Veterans Compensation and Pension benefits applicable to the current period but not yet paid, and (c) annuities for the current fiscal year administered by trust, pension, or insurance programs for which payment would be made in the following fiscal year. Such liabilities may be presented on the face of the financial reports as Other Current Liabilities or as one or more separate categories depending on the materiality of the amounts.

85 Federal entities may receive advances and prepayments from other entities for goods to be delivered or services to be performed. Before revenues are earned, the current portion of the advances and prepayments should be recorded as other current liabilities. After the revenue is earned (goods or services are delivered, or performance progress is made according to engineering evaluations), the entity should record the <R>appropriate amount as a revenue or financing source and should reduce the liability accordingly. Other current liabilities due to federal entities are intragovernmental liabilities that should be reported separately from those due to employees and the public.

86 The reporting entity should disclose the amount of current liabilities not covered by budgetary resources.

****

RECOMMENDED STANDARDS FOR
FINANCIAL ACCOUNTING AND REPORTING

OBJECTIVE

In this Statement, the Board recommends accounting standards for selected assets and liabilities of the federal government and its entities. The standards apply to both

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

governmental and commercial-type functions of the federal government.

The selected assets and liabilities are among the fundamental elements of federal accounting and financial reporting. By recommending these standards in the Board's first Statement, the Board's objective is to provide definitive accounting and reporting guidance to federal agencies in these fundamental areas at the earliest stage of the Board's consideration and development of federal accounting standards.

In a separate project, the Board is identifying users' needs and federal accounting and reporting objectives. Although the Board's deliberation on objectives has not been finalized, there is a general consensus that one overall objective for accounting and financial reporting is to assure accountability of federal government entities. The Board believes that issuing these selected standards will help in fostering that overall objective.

Specifically, the recommended standards would assist users of financial statements in:

-- assessing the efficiency and effectiveness of the government's management of its assets and liabilities, and

-- determining whether the government's financial position improved or deteriorated over the reporting period.

APPROACH

The Board's initial approach to developing accounting standards was to review the existing accounting standards prescribed by the General Accounting Office (GAO) in its Policy and Procedures Manual for the Guidance of Federal Agencies, Title 2 Accounting, (Title 2). The purpose of the review was to determine whether some of the <MI>Title 2<M> standards, with any necessary modifications, could be recommended by the Board to the principals of the Joint Financial Management Improvement Program (JFMIP).

Although the Title 2 standards had not been fully implemented by federal agencies, they represented a starting

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

point for further analysis. The Title 2 standards were reviewed in light of the accounting and reporting requirements established in the Chief Financial Officers (CFOs) Act of 1990. At the same time, the Board considered current accounting practices of federal agencies. It also considered the findings from its project on user needs and objectives of federal financial reporting. As a result of the review, the Board decided that with certain modifications, accounting standards for selected assets and liabilities could be recommended to the JFMIP principals.

These selected assets and liabilities involve less complex issues than other assets and liabilities to be considered by the Board in the future. The Board also believes that the selected assets and liabilities are so basic to financial reporting that they will not conflict with any conceptual framework that the Board may develop.<$FThe Board is also addressing other assets and liabilities. It has issued a proposed standard for direct loans and loan guarantees (see Exposure Drafts entitled Accounting for Direct Loans and Loan Guarantees, September 15, 1992, and Accounting for Inventory and Related Property, December 1992).>

The standards on the selected assets and liabilities were proposed in the Board's first Exposure Draft issued in September 1991, entitled Financial Resources, Funded Liabilities, and Net Financial Resources of Federal Entities. <R>A total of 69 respondents submitted their comments to the Board on the Exposure Draft. A public hearing on the Exposure Draft was held on February 28, 1992.

In preparing this Statement of recommended standards, the Board considered the respondents' comments. Based on the comments the Board received and its reevaluation in relation to the Board's current thinking on user needs and objectives of federal financial reporting, the Board made changes to the proposals contained in the Exposure Draft. The specific changes are discussed in Appendix A, Basis of the Board's Conclusions.

SCOPE

The selected assets addressed in this Statement are:

Cash

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

Fund Balance with Treasury
Accounts Receivable
Interest Receivable
Advances and Prepayments
Investments in Treasury Securities

The selected liabilities addressed in this Statement are:

Accounts Payable
Interest Payable
Other Current Liabilities

MATERIALITY

Except as otherwise noted, the accounting and reporting provisions of the accounting standards recommended in this Statement need not be applied to items that are qualitatively and quantitatively immaterial.

The determination of whether an item is material depends on the degree to which omitting or misstating information about the item makes it probable that the judgment of a reasonable person relying on the information would have been changed or influenced by the omission or the misstatement.

APPLICABILITY

The accounting standards recommended in this Statement are applicable to the federal government and its departments and agencies in the executive branch that fall within the definition of executive agency as defined in 31 U.S.C. 102 and 3501.

EFFECTIVE DATE

The FASAB recommends that, if the Principals approve the accounting standards recommended in this Statement, they become effective for fiscal years ending September 30, 1994, and thereafter.

****

APPENDIX A: BASIS OF THE BOARD'S CONCLUSIONS

87 This Appendix provides a discussion on the substantive comments that the Board received from

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

respondents to Exposure Draft No. 1, "Financial Resources, Funded Liabilities, and Net Financial Resources of Federal Entities" (November 18, 1991) and from testimony at a public hearing on the Exposure Draft held February 28, 1992. The Appendix explains the basis of the Board's conclusions on issues raised by the respondents.

BASIC CONCEPTS

Net financial resources. 88 In the Exposure Draft, the Board proposed the concept of net financial resources . The term net financial resources was referred to as an entity's total financial resources less its total funded liabilities (Exposure Draft, page 11). The Exposure Draft stated that the amount of net financial resources provides a general measure of an entity's financial sufficiency before new appropriations are provided. The Exposure Draft further stated that information on the components of an entity's net financial resources (obligated and unobligated balances of budget authority and other items) can provide additional insight into an entity's financial situation.

89 Many respondents do not see convincing evidence that the concept of net financial resources is useful. They point out that there are no concrete examples to illustrate how the information can be used. Some respondents also do not believe that the measure of net financial resources is well defined. They point out that one of the elements missing from the concept is the amount of unfunded liabilities. They state that without measuring unfunded liabilities, the measure of net financial resources is incomplete and can be misleading.

90 The Board has decided to postpone consideration of the net financial resources concept. The Board believes that the usefulness of the concept can be further explored after it completes its project on users' needs and objectives for financial accounting and reporting.

ENTITY FINANCIAL RESOURCES. 91 In the Exposure Draft, the Board discussed the concept of entity financial resources. The concept was defined as assets of a federal entity that consist of (a) the entity's cash and funds authorized and available for disbursement (excluding contract authority and unused authority to borrow), (b) resources of the entity that are expected to be converted

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

into cash to satisfy liabilities, and (c) conversion of cash into another form (for example prepayments) that would be consumed. Under this definition, the Exposure Draft identified as financial resources: cash, funds with Treasury, claims to cash (for example accounts receivable and loans receivable), claims to goods and services (for example advances and prepayments), inventories held for sale, and investments.

92 As indicated in the Exposure Draft, financial resources are a subset of assets that provide liquidity (cash and assets that can be converted to cash) to meet a federal entity's operational needs. The concept was considered useful because federal entities obtain resources from the budget to finance their operations and are held accountable for the use of the financial resources.

93 The Board has decided not to use the term financial resources in this document. However, a definition of the term financial resources and its usefulness will be further considered by the Board in its conceptual framework project. In the absence of the term, the items that would provide future economic benefits to the government and its entities are referred to as assets. The term asset as used in this document means an item that embodies a probable future economic benefit that can be obtained or controlled by the federal government or a reporting entity as a result of past transactions or events. (The definition of assets will be considered by the Board in the future.)

FUNDED LIABILITIES. 94 The Exposure Draft proposed the definition of funded liabilities as liabilities for which the federal entity has received budget authority to cover the related expenditure or expense.

95 The term funded liabilities would limit the recognition of liabilities to the extent that they are funded. The Board believes that the liabilities addressed in this document should be recognized when they are incurred, regardless of whether they are funded. The Board therefore decided not to use the term funded liabilities in this document. However, the Board recommends that disclosure be made for liabilities that are not covered by budgetary resources.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

96 The word liability used in this document means a probable and measurable future outflow of resources arising from past transactions or events.<$FA comprehensive definition of liabilities is being considered by the Board in its project concerning liabilities in general.> However, this document addresses only those selected liabilities that routinely recur in normal operations and that are due within a fiscal year. These liabilities are accounts payable, interest payable, and other current liabilities. The category of other current liabilities includes salary and entitlement benefit expenses that are accrued and would be paid within a fiscal year.

GENERAL STANDARDS

97 The recommended standards apply to reporting by the federal government and its entities for both governmental assets and liabilities and intragovernmental assets and liabilities reported at the entity level.

98 An entity may have two categories of assets and liabilities intragovernmental and governmental assets and liabilities. The difference between intragovernmental and governmental assets and liabilities is explained below:

(1) Intragovernmental assets and liabilities. These assets and liabilities arise from intragovernmental transactions. For example, investments held by a federal entity in Treasury securities are reported by the entity as an asset. However, the Treasury securities also are liabilities of the Department of the Treasury. Thus, the securities represent intragovernmental assets and liabilities. Another example is fund balance with Treasury. An entity's fund balance with Treasury of an entity will be reported as an asset by the entity. However, it is not an asset of the federal government; rather, it is a commitment of the U.S. government to provide funds to a federal entity. (See discussion, which follows, on Fund balance with Treasury .)

(2) Governmental assets and liabilities. These are assets and liabilities that arise from transactions of the federal government with nonfederal entities (persons and organizations outside the U.S. government, either foreign or domestic). For example, income taxes to be

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

collected from the public are reported on IRS financial statements as receivables. These receivables are assets of the federal government.

99 The recommended standards require that intragovernmental assets and liabilities be reported separately from governmental assets and liabilities.

100 Assets reported by an entity also are distinguished between entity and non-entity assets.

(1) Entity assets. Entity assets are assets that are available to an entity for its use. Entity assets include both intragovernmental and governmental assets. Supplies inventory held by an entity for consumption in its operations is an entity asset as well as a governmental asset. A receivable of a federal entity from another federal entity is an entity asset if the receiving entity has authority to use the amount collected.

(2) Non-entity assets. An entity may have assets under its custody and management that the entity is not authorized to use. In this Statement, these assets are called non-entity assets, as distinguished from entity assets that the entity is authorized to use in its operations. For example, customs duty receivables to be collected by the Customs Service is a non-entity asset that would be reported by the Customs Service.

101 The Board recommends that both entity assets and non-entity assets under an entity's custody or management be recognized in the entity's financial statements. Non-entity assets should be separately reported in an entity's financial statements.

102 The following exhibit, using receivables as an example, illustrates the relationship between entity and non-entity assets on one hand and intragovernmental and governmental assets on the other hand.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

ACCOUNTS RECEIVABLE

	Entity Assets	Non-entity assets
Intra-governmental Assets	Amounts receivable from a federal entity for goods or services delivered that will be available to the receiving entity to spend.	Amounts to be collected from a federal entity that will not be available to the receiving entity to spend.
Governmental Assets	Amounts receivable from a nonfederal entity for goods or services delivered that will be available to the receiving entity to spend.	Amounts (such as taxes) to be collected from a nonfederal entity that will not be available to the receiving entity to spend.

SPECIFIC STANDARDS

Cash

103 The Board has retained from the Exposure Draft the requirement for separate reporting of restricted and unrestricted cash. However, after considering comments on the Exposure Draft, the Board has modified the definition of restricted cash.

104 The Exposure Draft proposed that unrestricted cash include amounts in demand deposits. However, whether an amount of cash is restricted does not depend on where the cash is kept. For example, federal entities may hold cash in demand deposit accounts on behalf of Treasury. Since the entities have no authority to spend the cash, from the entities' perspective, these amounts of cash are restricted.

105 The recommended standard in this document redefines restricted cash as (1) amounts of cash that an entity holds on behalf of Treasury or other entities and does not have authority to spend, and (2) amounts of cash that are legally restricted to specific purposes.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

Fund Balance with Treasury

106 The recommended standard provides guidance on the composition of fund balance with Treasury. Events that cause an entity's fund balance to increase include receiving appropriations, allocations, transfers, receipts that the entity is authorized to spend (or to use to offset its expenditures) and borrowing from Treasury. An entity's fund balance is reduced by amounts disbursed to pay liabilities and expenditures, amounts invested in securities, amounts of appropriations canceled or rescinded, and amounts transferred to other agencies or to the Treasury.

107 With respect to fund balance with Treasury, the Board has considered the following issues:

(1) IS FUND BALANCE WITH TREASURY AN ASSET?

108 The Board believes that from the perspective of a federal entity (such as a bureau, a program, or a fund), fund balance with Treasury is an asset. In fact, it is the most important source against which an entity can make expenditures and incur liabilities.

109 However, the Board recognizes that a fund balance with Treasury is an intragovernmental item. It represents a entity's authorized claim to the federal government's resources on one hand, and the government's commitment to supply resources to the entity on the other hand. The claims and commitments would not be reported when financial reports of individual entities are consolidated on a government-wide level. Thus, from the perspective of the federal government as a whole, fund balances with Treasury are not assets of the federal government.

(2) HOW DOES FUND BALANCE WITH TREASURY RELATE TO BUDGETARY RESOURCES?

110 A fund balance is created by budget authority. An appropriation is the major form of budget authority that creates a fund balance with Treasury for an entity. Thus, the relationship between fund balance with Treasury and budget authority cannot be ignored.

111 However, an entity's fund balance with Treasury

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

does not necessarily equal its budgetary resources. The difference between these two concepts may be clarified by examining their definitions. A fund balance represents the sum of amounts that is actually available in an entity's accounts with Treasury. Budgetary resources on the other hand encompass all authorities for an entity to incur obligations. Some of the authorities do not in themselves provide funds to the entity. Contract authority, for example, allows an entity to incur obligations under a contract. However, it does not, in itself, provide funds to the entity's accounts with Treasury. An appropriation is necessary for the entity to have funds to liquidate obligations incurred under contract authority.

112 Authority to borrow does not in itself place funds into an entity's accounts with Treasury. In order to increase its fund balance with Treasury, an entity must actually borrow under its borrowing authority.

113 For these reasons, the recommended standard states that fund balance with Treasury does not include contract authority and unused authority to borrow.

(3) SHOULD THE FUND BALANCE EXCLUDE FUNDS DESIGNATED FOR SPECIAL PURPOSES?

114 Some respondents to the Exposure Draft believe that the standard should identify funds held with Treasury that are not available to the entity's operations. For example, the Department of Energy collects fines levied under the Emergency Petroleum Allocation Act of 1973, deposits those funds in an escrow account with Treasury, and ultimately disburses those funds to injured parties or for other uses as directed by court decisions.

115 It is not unusual that funds in certain accounts are held and restricted to specific purposes. Amounts of trust funds, for example, are held for the specific purpose of making benefit payments to eligible recipients. The restriction on funds held for the Department of Energy to pay persons injured by oil pricing and allocation violations is another example. The Board believes that the fund balance of a reporting entity should include funds held in all accounts of the entity regardless of whether they are designated for specific purposes.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

Accounts Receivable

116 Respondents raised issues related to the recognition and measurement of losses due to uncollectible amounts. Before addressing the Board's actions in relation to respondents' comments, however, the terms recognition and measurement as used in this Statement are explained below:

117 Recognition means formally recording or incorporating an item into the records and financial statements as an asset, liability, expense, revenue, or similar element. For assets or liabilities, recognition encompasses subsequent changes to the amounts of assets and liabilities.

118 Measurement is the process of expressing an asset or liability in monetary units. Measuring an item requires selecting an appropriate measurement attribute such as historical cost, current market value, net realizable value, or present value of future cash flows.

119 In the proposed standard and the discussion of accounts receivable, the term recognition concerns the timing of recording an asset or the impairment of an asset in the financial records. The term measurement concerns the valuation basis and the dollar amount of the asset that should be reported.

120 Detailed discussions of respondents' comments and the Board's actions are provided in the following paragraphs.

121 Timing of receivable recognition. The Exposure Draft states that a receivable should be recorded when events (e.g., payment due dates) or transactions occur that entitle an entity to accrue revenue or receive a reimbursement or fund transfer. Some respondents questioned the use of payment due dates as a criterion for recognizing receivables. These respondents stated a receivable should be recognized when an entity is owed an amount or earns a revenue, and that due dates are irrelevant.

122 Some receivables result from exchange transactions. For example, receivables may result from goods

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

and services provided to other entities. However, claims to cash or other assets also result from the federal government's legal authority to levy taxes and impose duties, fees and fines. These receivables are not related to revenue-earning functions or exchange transactions, but are based on the federal government's authority to collect the payments and a party's liability to pay cash or provide other assets to cover the claims. For the accrual of taxes, the tax due date represents the date that the government demands payment. The payment due date is a definitive criterion for accruing taxes.

123 The Board, therefore, recommends that a receivable be recognized when a claim to cash or other assets is established based either on goods or services provided or the government's legal authority to levy and collect. The Board is not recommending a revenue recognition standard at this time.

124 Loss recognition. In the Exposure Draft, it was proposed that a loss be recognized when it is more likely than not that a receivable has been impaired. The phrase more likely than not means a greater than 50 percent probability of occurrence.

125 Several respondents questioned why the Board used the more likely than not criterion for loss recognition instead of the probable criterion used in the private sector under generally accepted accounting principles (GAAP).[Footnote]

[Footnote: FASB Statement of Standards No.5, Accounting for Contingencies.]

126 The Board may refer to the pronouncements and statements issued by other standard setting bodies in deliberating accounting standards for the federal government. However, the Board is not bound by these pronouncements and statements, especially when accounting standards promulgated for other sectors are not relevant to the federal government.

127 In the case of loss recognition on receivables, the Board believes that there should be a definitive guideline for recognizing government credit losses. The word probable is subject to broad interpretation (often being

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

interpreted as meaning a virtual certainty of occurrence) and could allow for belated recognition of losses.

128 The Board proposed the more stringent criterion of more likely than not, which requires the recognition of losses when there is more than a 50 percent chance that some receivables will not be collected. In recommending the more likely than not criterion, the Board's intent is to achieve unbiased, consistent, and reliable loss recognition in federal government accounting.

129 The more likely than not criterion can be applied to both individual accounts and groups of accounts. Both significant individual accounts receivable (e.g., unusually large refunds due from contractors, medicaid reimbursements from third parties, substantial tax delinquencies, or other large claims) and groups of small accounts should be analyzed and losses recognized if it is more likely than not that some or all of the amounts owed will not be collected.

130 When applying the loss recognition criterion, the Board believes it is appropriate to recognize the nature of federal receivables. Many of the federal government's receivables, unlike trade accounts of private firms or loans made by banks, are not created through credit screening procedures. These receivables arise because of activities such as fines from regulatory violations, refunds from erroneous benefit payments, reimbursements, and overdue taxes and duties. In these circumstances, historical experience and economic factors indicate that the receivables frequently are not fully collectible. These receivables meet the loss recognition test because of their inherent risk. Therefore, an appropriate amount of allowance for losses should be recognized at their inception.

131 Loss measurement. Because of the large volume of federal transactions, accounts receivable generally exist in large groups. Some groups may consist of several hundred thousand accounts. In such cases, losses on uncollectible amounts should be assessed on a group basis using statistical sampling techniques. Statistical sampling should be supplemented by historical trend experience, adjusted for current conditions.

132 On the other hand, some government receivables

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

arise from transactions of significant amounts. These receivables should be individually analyzed to assess losses due to risks specifically attributable to the individual accounts. The assessment of impairment of individual accounts may not always provide a valid basis to estimate the impairment of the entire group. Often, losses may exist for the group that are not currently identifiable on an individual basis. The Board believes that the federal government's receivables are generally subject to losses due to inherent risks. Therefore, allowances for receivables should be viewed in the context of the overall risk of the receivables being assessed.

133 Based on the above considerations, the recommended standard provides that, for reporting purposes, losses on accounts receivable should be determined by evaluating accounts on both a group and an individual basis.

Interest Receivable

134 In the Exposure Draft, the proposed standard requires that interest be recognized on a receivable until the receivable is repaid or written off. At the same time, the proposed standard requires that an allowance for uncollectible interest be provided. The intent of the proposed standard is to establish the debtor's liability for the accrued interest.

135 Some respondents expressed concern that there is usually a lengthy period from the time a receivable is determined to be uncollectible until it is written off. It would be burdensome to recognize interest on the uncollectible receivable and, at the same time, offset the amount of interest recognized by an allowance for uncollectible interest.

136 The initial intent of this procedure was to maintain a correct amount of the debtor's liability. This purpose can be achieved by record-keeping procedures rather than financial reporting. Therefore, for financial reporting, the Board has concurred that (a) interest receivable should be recognized only on collectible accounts, and (b) interest receivable on uncollectible accounts should be recognized only when it is actually received.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

Advances and Prepayments

137 There were no comments on the substance of the recommended accounting standard for advances and prepayments since the standard does not contain significant changes from the current accounting practice within federal government agencies. Some respondents requested that the Board clarify that prepayments do not include progress payments made on long-term contracts. Since progress payments are made based upon percentage of completion of a contract, the Board concluded that progress payments are not advances or prepayments.

138 Comments were also received questioning whether advances and prepayments should be included within the definition of financial resources (as proposed in the Exposure Draft) since advances and prepayments are not usually converted to cash or budget authority available for use by the entity.

139 The Board recognizes that, as in the case of inventories held for consumption, advances and prepayments convert into goods and services, but do not convert into cash. However, since the term financial resources is not used in this Statement, the issue is now moot. Advances and prepayments normally benefit current operations and, therefore, are normally considered current assets.

Investments in Treasury Securities

140 The recommended standard applies to investments in Treasury securities, including (1) nonmarketable par value Treasury securities, (2) market-based Treasury securities held to maturity, and (3) marketable Treasury securities held to maturity.

141 In the future, the Board will address investments that are not covered by this standard. In the interim, federal entities should continue their current accounting practices for those investments not covered by this standard.

142 Federal entities, particularly the Social Security and the retirement trust funds, invest available funds in excess of their current needs in special Treasury securities issued in the government account series. The terms of the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

Treasury securities are usually designed to meet the cash needs of government accounts. The vast majority of the investments are in nonmarketable Treasury securities issued exclusively to federal agencies. Most of them are par value securities, and some are market-based securities whose prices and interest rates reflect market terms. Thus, although the scope of the recommended standard is limited, it covers more than 90 percent of federal entities' investments.

143 A few federal entities are permitted to buy and sell marketable Treasury securities on the open market. Some federal entities which conduct business with the public or provide insurance to the private sector may acquire marketable Treasury securities as a part of a rescue and takeover transaction. This standard applies to marketable Treasury securities only to the extent that they are expected to be held to maturity.

144 In the Exposure Draft, the Board proposed that investments in par value nonmarketable Treasury securities be reported at cost. The Board also proposed that marketable securities and market-based Treasury securities be reported at market value as of the reporting date.

145 A number of respondents, however, expressed concern with the recognition of increases and decreases in assets based on market value, and the recognition of associated gains or losses. These respondents believe these are unrealized gains and losses which do not represent actual increases or decreases in assets. Some respondents also indicated that market value fluctuations generally do not affect an entity's investments in securities intended to be held to their maturity.

146 In this Statement, the Board continues to use the cost based valuation for nonmarketable par value Treasury securities. The cost basis is appropriate for this type of security because the invested amounts will be fully recovered at redemption.

147 The Board also recommends the cost or amortized cost basis for the valuation of market-based Treasury securities and marketable Treasury securities that are to be held to maturity. The Board believes that the cost basis is appropriate because the invested amounts can be fully

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

recovered when the Treasury securities mature. During the time periods when the securities are outstanding, the market prices of the securities may fluctuate due to interest rate changes or other temporary causes. However, so long as the securities are not to be sold to the market, the investing entity would not be affected by such market price fluctuations. For this reason, the Board decided to recommend the cost based approach rather than market value approach for marketable Treasury securities expected to be held to maturity.

148 The Board considered the valuation issues related to securities not covered by this standard. The Board has concluded that the use of a fair value approach pertains to a broad conceptual issue that needs to be addressed in its conceptual framework. Until the Board reaches decisions on the conceptual framework, it is premature to recommend a valuation basis for securities beyond those covered by this standard.

149 The Board believes that the criteria for classifying an investment as expected to be held to maturity should be based on the intent and ability of the investing entity to hold the security to its maturity. Intent and ability differ from a mere absence of an intent to sell the security. An evaluation of whether an entity has the intent and ability to hold its investments should be based on the entity's current and projected financial condition and its recent pattern in buying, selling, and managing Treasury securities. A security should not be classified as expected to be held to maturity if for cash needs or other investment management reasons the investing entity is not able to hold the security to its maturity.

150 At each financial reporting date, the appropriateness of this classification should be reassessed. In rare instances, an entity's originally stated intent or ability to hold a security to maturity may change due to significant unforeseen changes in the entity's cash needs or in other circumstances. When this occurs, securities initially classified as expected to be held to maturity should be reclassified to securities available for sale or early redemption.

Accounts Payable

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

151 Accounts payable are set up to record an entity's liability for goods and services received or work progress made by a contractor for which payment has not been made.

152 Some respondents questioned the timing of recognizing a liability in accounts payable. A federal entity, under budgetary accounting, records an obligation when the entity places a purchase order or signs a contract.<$FThe term obligations incurred is defined as amounts of orders placed, contracts awarded, services received, and similar transactions that will require payment in the same or future periods. Such amounts include outlays for which obligations have not been previously recorded. Such amounts also include adjustments for (a) differences between amounts recorded as obligations and actual outlays to liquidate those obligations, (b) cancellations of obligations, and (c) refunds arising during the reporting period for recovery of erroneous payments or due to accounting adjustments. However, adjustments to obligations incurred in prior years are reported separately as recoveries of prior year obligations. (For legal basis of obligations incurred, see 31 U.S.C. 200 and OMB Circular A-34.) See also JFMIP Report, Project on Standardization of Basic Financial Information Requirements of Central Agencies, (October, 1991) p. 24.> An obligation, once incurred, reduces an entity's resources available for obligation. Budgetary accounting entries are required to record the amounts obligated and to reduce the available budget authority. For financial reporting purposes, liabilities are recognized when goods and services are received or are recognized based on an estimate of work completed under a contract or agreement.

153 Some federal entities believe it is appropriate to recognize a liability in accounts payable when a purchase order is placed. The theory of this practice is that the purchase order represents a use of the entity's budgetary resources and that recognizing the liability would correctly reduce the entity's available budgetary resources.

154 Proponents for this practice also argue that, in many cases, goods produced under government contracts bear unique specifications for government needs and, as a result, cannot be sold to other customers. Thus, they argue that it is virtually certain that the government has incurred a liability toward the contractor.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

155 The Board recognizes that there is a need to reconcile budget execution results and financial effects. In budgetary accounting, when a purchase order is placed, an obligation is recorded to ensure budgetary control. However, recognition of the claim from a financial accounting standpoint does not occur until goods are delivered, work progress is actually made by a contractor, or services are performed since these events generally trigger a cash outlay that liquidates the obligation. The Board does not believe that recognizing a liability prior to a actual receipt or constructive receipt of goods or services should be adopted as a financial accounting standard. It also does not believe that it is appropriate to erase the distinction between recording obligations for budget purposes and recognizing a liability for financial accounting purposes.

156 Some respondents question whether a liability should be recognized for multi-year contracts that are to be financed through appropriations over a number of years. As has been discussed earlier, when a contract is entered, an obligation is recognized in budgetary accounting. However, until goods or services are received or work progress is made, the Board does not believe that an obligation should be recognized as a liability. When goods or services are received or work progress is made under either a short or long-term contract, a liability for unpaid amounts should be recognized.

Interest Payable

157 There were no substantial comments on the recommended accounting standard for interest payable. The recommended standard does not differ from the current accounting practice within federal government agencies.

Other Current Liabilities

158 The recommended standard covers the current liabilities that are not specifically defined in other standards. Current liabilities specifically defined in this Statement are accounts payable and interest payable. Accounts payable and interest payable represent liabilities arising from discrete transactions. The Board also plans to issue statements to define other specific liabilities such as liabilities incurred under a loan guarantee contract and

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

borrowings from other entities.

159 Other current liabilities generally are related to on-going and continuous expenses, which are typically recognized throughout each accounting period rather than on an individual transaction basis. A typical example is the liability for employees salary that is accrued at the end of a fiscal year but is not paid.

160 The Exposure Draft indicated that a liability was considered funded if the related expense was incurred under budget authority. Some respondents suggested that the term budget authority be changed to budgetary resources . They argued that budgetary resources encompass not only new budget authority, but also other resources available to incur liabilities for specified purposes in a given year.

161 The Board agrees that a liability (or a portion of the liability) should be considered funded from the reporting entity's perspective if it is covered by available budgetary resources. However, the recommended standard takes the position that a liability should be recognized when it is incurred, regardless of whether it is covered by available budgetary resources. The recommended standard also requires that disclosure should be made for liabilities that are not covered by available budgetary resources.

****

APPENDIX B: ILLUSTRATION OF THE INTEREST METHOD FOR INVESTMENT DISCOUNT AND PREMIUM

This Appendix provides an illustration of the interest method for amortizing a discount or premium of an investment in a marketable or a market-based Treasury security, such as a Treasury bond. The interest method is required in the recommended standard for investments. Before explaining the interest method itself, the concept of discount and premium will be explained.

Bond Discount and Premium

The price of a bond equals the present value of the bond's net future cash flows, including principal and interest payments, discounted to the time of its issuance. The discount rate is referred to as the effective interest

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

rate. Since the effective interest rate usually equals the market interest rate, it may differ from the stated interest rate (the coupon rate) of the bond. The difference between the effective interest rate of a bond and its stated interest rate causes the bond price to be different from its face amount.

A Treasury bond may be purchased at a price higher or lower than the bond's face amount (par amount). The difference between the purchase price and the face amount is a discount if the price is lower than the face amount; or a premium if the price is higher than the face amount. The investor initially records the bond at its face amount and records the discount or the premium in a valuation allowance account. Thus, the carrying amount of the bond equals its face amount minus or plus the discount or the premium. The discount or the premium is amortized over the life of the bond, so that the bond would be redeemed at its face amount at its maturity.

The Interest Method [Footnote 10]

Under the interest method of amortization, an amount of interest equal to the carrying amount of the investment times the effective interest rate, is calculated for each accounting period. This calculated interest is the effective interest of the investment (referred to as effective yield in some literature). The amount of effective interest is compared with the stated interest of the investment. (The stated interest is the interest that is payable to the investor according to the stated interest rate.) The difference between the effective interest and the stated interest is the amount by which the discount or the premium should be amortized (i.e., reduced) for the accounting period.

[Footnote 10 :The interest method of amortization is described in several FASB statements and APB Opinions. For example, see paragraph 18, FASB Statement No. 91, Accounting for Nonrefundable Fees and Costs Associated with Originating or Acquiring Loans and Initial Direct Costs of Leases, and paragraph 16 of APB Opinion No. 12, Omnibus Opinion.]

EXAMPLES [Footnote 11]

In the first example, which shows the amortization of a

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

discount, Treasury bonds with the face amount of $100,000 were purchased by a federal entity on the bonds' issuance date, January 1, 1992. The bonds' stated interest rate is 7 percent, and interest is payable at the end of each year. The bonds will mature in 5 years, on December 31, 1996. The cost of the investment is $96,007, with a discount of $3,993, which reflects an effective interest rate of 8 percent.

[Footnote 11: The examples are adapted from Glenn A. Welsch and Charles T. Zlatkovich, Intermediate Accounting, 8th ed. (Boston: Richard D. Irwin, Inc., 1989), p. 656.]

In Table 1 below, the annual discount amortization is in column 4, which equals column 3 minus column 2.

TABLE 1: DISCOUNT AMORTIZATION

DATE	STATED INTEREST 7%	BONDS EFFECTIVE INTEREST 8%	DISCOUNT AMORTIZATION	UNAMORTIZED BALANCE	CARRYING AMOUNT
1/1/92				$3,993	$96,007
12/31/92	$7,000	$7,681	$681	3,312	96,688
12/31/93	7,000	7,735	735	5,577	97,423
12/31/94	7,000	7,794	794	1,783	98,217
12/31/95	7,000	7,857	857	926	99,074
12/31/96	7,000	7,926	926	0	100,000

In the second example, which is the amortization of a premium, Treasury bonds with the face amount of $100,000 were purchased by a federal entity on the bonds' issuance date, January 1, 1992. The bonds' stated interest rate is 7 percent, and interest is payable at the end of each year. The bonds will mature in 5 years, on December 31, 1996. The cost of the investment is $104,212, with a premium of $4,212, which reflects an effective interest rate of 6 percent.

In Table 2 below, the annual premium amortization is in column 4, which equals column 2 minus column 3.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

TABLE 2: PREMIUM AMORTIZATION

DATE	STATED INTEREST 7%	EFFECTIVE INTEREST 6%	PREMIUM AMORTIZATION	UNAMORTIZED BALANCE	BONDS CARRYING AMOUNT
1/1/92				$4,212	$104,212
12/31/92	$7,000	$6,253	$747	3,465	103,465
12/31/93	7,000	6,208	792	2,673	102,673
12/31/94	7,000	6,160	840	1,833	101,833
12/31/95	7,000	6,110	890	943	100,943
12/31/96	7,000	6,057	943	0	100,000

APPENDIX C: GLOSSARY

This glossary provides definitions of many terms used in this Statement. The definitions may be modified or superseded when relevant terms are considered or defined by the FASAB in future projects.

ALLOCATIONS: The amount of obligational authority transferred from one agency, bureau, or account that is set aside in a transfer appropriation account to carry out the purpose of the parent appropriation or fund. (JFMIP, Project on Standardization of Basic Financial Information Requirements of Central Agencies, dated October 1991, hereafter cited as JFMIP Standardization Project)

AMORTIZATION: The gradual extinguishment of any amount over a period of time through a systematic allocation of the amount over a number of consecutive accounting periods such as the retirement of a debt by serial payments to a sinking fund. (Kohler's Dictionary).

APPROPRIATION: In most cases, appropriations are a form of budget authority provided by law that permits federal agencies to incur obligations and make payments out of the Treasury for specified purposes. An appropriation usually follows enactment of authorizing legislation. An appropriation act is the most common means of providing budget authority, but in some cases the authorizing legislation itself provides the budget authority.

ASSETS: Tangible or intangible items owned by the federal

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

government which would have probable economic benefits that can be obtained or controlled by a federal government entity. (Adapted from FASB Concepts Statement No. 6 and Kohler's Dictionary.)

AUTHORITY TO BORROW: Authority to borrow is a subset of budget authority. (See budget authority.)

BUDGET AUTHORITY: The term budget authority means the authority provided by Federal law to incur financial obligations, as follows:

-- provisions of law that make funds available for obligation and expenditure (other than borrowing authority), including the authority to obligate and expend the proceeds of offsetting receipts and collections;

-- borrowing authority (authority to borrow), which means authority granted to a Federal entity to borrow and obligate and expend the borrowed funds, including through the issuance of promissory notes or other monetary credits;

-- contract authority, which means the making of funds available for obligation but not for expenditure [Statutory authority under which contracts or other obligations may be entered into prior to an appropriation for the payment of such obligations. The later appropriation provides cash to liquidate such obligations. See OMB Circular A-34.], and

-- offsetting receipts and collections as negative budget authority, and the reduction thereof as positive budget authority. (Omnibus Budget Reconciliation Act of 1990 (Pub. L. 101-508), Sec. 13211): Budget authority may be classified by period of availability (1-year, multiple-year, and no-year), by nature of authority (current or permanent), by the manner of determining amount available (definite or indefinite), or as gross (without reduction of offsetting collections) and net (with reductions of offsetting collections).

BUDGETARY RESOURCES: Those amounts available to enter into obligations for specified purposes in a given year. They include: (1) new budget authority, (2) offsetting

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

collections credited to an appropriation or fund account, (3) recoveries of unexpired budget authority through downward adjustments of prior year obligations, <R>and, (4) unobligated balances of such resources at the beginning of the year or transferred in during the year. (JFMIP Standardization Project)

COLLECTIONS: Amounts received by the federal government during the fiscal year. Collections are classified as follows:

-- Budget receipts or off-budget receipts are collections from the public based on the government's exercise of its sovereign powers, including collections from participants in compulsory social insurance programs.

-- Offsetting collections are collections from government accounts (intragovernmental transactions) or from the public that are offset against budget authority and outlays rather than reflected as receipts in computing the budget and off-budget totals. They are classified as (a) offsetting receipts (i.e., amounts deposited to receipt accounts), and (b) collections credited to appropriation or fund accounts. The distinction between these two major categories is that collections credited to appropriation or fund accounts are offset within the account that contains the associated disbursements (outlays), whereas offsetting receipts are in accounts separate from the associated disbursements. Offsetting collections are deducted from gross disbursements in calculating net outlays. (Based on A Glossary Of Terms Used in the Federal Budget Process; and Related Accounting, Economic, and Tax Terms, Third Edition, General Accounting Office, March 1981, hereafter referred to as the Budget Glossary.)

CONTRACT AUTHORITY: Contract authority is a subset of budget authority. (See budget authority.)

CURRENT LIABILITIES: Amounts owed by a federal entity for which the financial statements are prepared, and which need to be paid within the fiscal year following the reporting date.

DIRECT LOAN: A disbursement of funds by the government to a

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

nonfederal borrower under a contract that requires the repayment of such funds within certain time, with or without interest. The term includes the purchase of, or participation in, a loan made by another lender. (Adapted from OMB Circular No. A-11.)

ENTITY: A unit within the federal government, such as a department, agency, bureau, or program, for which a set of financial statements would be prepared. Entity also encompasses a group of related or unrelated commercial functions, revolving funds, trust funds, and/or other accounts for which financial statements will be prepared in accordance with OMB annual guidance on Form and Content of Financial Statements.

EXPENSE: Outflows or other using up of assets or incurrence of liabilities (or a combination of both) during a period of providing goods, rendering services, or carrying out other activities related to an entity's programs and missions, the benefits from which do not extend beyond the present operating period. (Adapted from Kohler's Dictionary and FASB Concepts Statement No. 6.)

EXPIRED APPROPRIATIONS (ACCOUNTS): Appropriation accounts in which the balances are no longer available for incurring new obligations because the time available for incurring such obligations has expired. (JFMIP Standardization Project)

FEDERAL ENTITIES (UNITS, COMPONENTS): See entity.

INTEREST METHOD: For purposes of this Statement, the method used to amortize a bond discount or premium using the effective interest rate (the discount rate) of the bond. The amortized amount equals the effective interest amount minus the stated interest amount. (See Appendix B.)

LIABILITY: A probable and measurable future outflow of resources arising from past transactions or events.

MARKET-BASED TREASURY SECURITIEs: Treasury securities issued to governmental accounts that are not traded on any securities exchange but mirror the prices of marketable securities with similar terms. (See Treasury Financial Manual 2-4100, Federal Agencies' Financial Reports, Exhibit No. 3.)

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

MARKET VALUE: For investments in marketable securities, the term refers to the value of such securities determined by prices quoted on securities exchange markets multiplied by the number of bonds or shares held in an investment portfolio.

MARKETABLE TREASURY SECURITIES: Debt securities, including Treasury bills, notes, and bonds, that the U.S. Treasury offers to the public and are traded in the marketplace. Their bid and ask prices are quoted on securities exchange markets.

NET REALIZABLE VALUE (NRV): The estimated amount that can be recovered from disposing of an item.

OBLIGATED BALANCES: The net amount of obligations in a given account for which payment has not yet been made. (JFMIP Standardization Project) Obligations: Amounts of orders placed, contracts awarded, services received, and other transactions occurring during a given period that would require payments during the same or a future period. (JFMIP Standardization Project)

OFFSETTING RECEIPTS: Offsetting receipts are a subset of offsetting collections. (See collections.)

REAPPROPRIATION: Enacted legislation that continues the availability of unexpended funds that expired or would otherwise expire. (JFMIP Standardization Project)

RECOGNITION (OR RECOGNIZE): The term recognition, as used in this Statement, bears the same meaning as used by FASB in its conceptual statements. Recognition is the process of formally recording or incorporating an item into the financial statements of an entity as an asset, liability, revenue, expense, or the like. A recognized item is depicted in both words and numbers, with the amount included in the statement totals. Recognition comprehends both initial recognition of an item and recognition of subsequent changes in or removal of a previously recognized item. (FASB Statement of Financial Accounting Concepts No. 5, para. 6)

REIMBURSEMENTS: Sums received as payment or advance payment for goods or services furnished either to the public or to

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_1.pdf.

another federal government account. If authorized by law, these sums are credited directly to specific appropriation and fund accounts. These amounts are deducted from the total obligations incurred (and outlays) in determining net obligations (and outlays) for such accounts. (Budget Glossary) Reimbursements are offsetting collections. (See offsetting collections.)

TRANSFERS BETWEEN APPROPRIATION/FUND ACCOUNTS: Occur when all or part of the budget authority in one account is transferred to another account when such transfers are specifically authorized by law. The nature of the transfer determines whether the transaction is treated as an expenditure transfer or a non-expenditure transfer. (JFMIP Standardization Project)

UNOBLIGATED BALANCES: Balances of budgetary resources that have not yet been obligated. (JFMIP Standardization Project)

Unobligated balances expire (cease to be available for obligation) for:

-- 1-year accounts at the end of the fiscal year;

-- multiple-year accounts at the end of the period specified;

-- no-year accounts only when they are 1) rescinded by law, 2) purpose is accomplished, or 3) when disbursements against the appropriation have not been made for 2 full consecutive years. (Budget Glossary).

EXECUTIVE SUMMARY

1 The Statement provides accounting standards for federal direct loans and loan guarantees. The standards require that direct loans obligated and loan guarantees committed after September 30, 1991, be accounted for on a present value basis. The use of the present value accounting method is consistent with the intent of the Federal Credit Reform Act of 1990.

2 The standards contain the following essential requirements:

-- Direct loans disbursed and outstanding are recognized as assets at the present value of their estimated net cash inflows. The difference between the outstanding principal of the loans and the present value of their net cash inflows is recognized as a subsidy cost allowance.

-- For guaranteed loans outstanding, the present value of estimated net cash outflows of the loan guarantees is recognized as a liability. Disclosure is made of the face value of guaranteed loans outstanding and the amount guaranteed.

-- For direct or guaranteed loans disbursed during a fiscal year, a subsidy expense is recognized. The amount of the subsidy expense equals the present value of estimated cash outflows over the life of the loans minus the present value of estimated cash inflows.

-- The subsidy cost allowance for direct loans and the liability for loan guarantees are reestimated each year, taking into account all factors that may have affected the estimated cash flows. Any adjustment resulting from the reestimates is recognized as a subsidy expense (or a reduction in subsidy expense).

-- When direct loans or loan guarantees are modified, the cost of modification is recognized at an

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

amount equal to the decrease in the present value of the direct loans or the increase in the present value of the loan guarantee liabilities measured at the time of modification.

-- Upon foreclosure of direct or guaranteed loans, the acquired property is recognized as an asset at the present value of its estimated future net cash inflows.

3 The standards permit but do not require restating pre-credit reform direct loans and loan guarantees at present value.

****

INTRODUCTION

BACKGROUND

4 The federal government, in discharging its reponsibility to promote the nation's general welfare, makes DIRECT LOANS [Footnote 1] and guarantees loans to segments of the population not adequately served by nonfederal financial institutions. Examples of federal CREDIT PROGRAMS include farmers' home loans, small business loans, veterans' mortgage loans, and student loans. For those unable to afford credit at the market rate, federal credit programs provide subsidies in the form of direct loans offered at an interest rate lower than the market rate. For those to whom nonfederal financial institutions would be reluctant to grant credit because of the high risk involved, federal credit programs guarantee the payment of these nonfederal loans, absorbing the costs of defaults.

[Footnote 1: Terms included in Appendix C: Glossary are printed in CAPITAL LETTERS when they appear for the fist time. (In the printed text, the terms appeared in bold face.)]

5 Because federal credit programs provide interest subsidies and sustain losses caused by defaults, the costs of these programs are significant. It is crucial, therefore, that the actual and expected costs of federal credit programs be fully recognized in both budget and financial reporting.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

THE FEDERAL CREDIT REFORM ACT OF 1990

6 The primary intent of the Federal Credit Reform Act of 1990 is to ensure that the SUBSIDY COSTS of direct loans and LOAN GUARANTEES are taken into account in making budgetary decisions. To achieve this general result, the Act has the following specific purposes: (a) ensure a timely and accurate measure and presentation in the President's budget of the costs of direct loan and loan guarantee programs, (b) place the cost of credit programs on a budgetary basis equivalent to other federal spending, (c) encourage the delivery of benefits in the form most appropriate to the needs of beneficiaries, and (d) improve the allocation of resources among credit programs and between credit and other spending programs.

7 The major provisions of the Act, which is effective for fiscal year 1992 and thereafter, are to:

-- Require that, for each fiscal year in which the direct loans or the loan guarantees are to be obligated, committed, or disbursed, the President's budget reflect the long-term cost to the government of the subsidies associated with the direct loans and loan guarantees. The subsidy cost estimate for the President's budget is to be based on the PRESENT VALUE of specified cash flows discounted at the average rate of marketable Treasury securities of similar maturity.

-- Require that, before direct loans are obligated or loan guarantees are committed, annual appropriations generally be enacted to cover these costs. (However, mandatory programs have permanent indefinite appropriations.)

-- Provide for borrowing authority from Treasury to cover the non-subsidy portion of direct loans.

-- Establish budgetary and financing control for each credit program through the use of three types of accounts: the PROGRAM ACCOUNT (budgetary), the FINANCING ACCOUNT (non-budgetary), and the LIQUIDATING ACCOUNT (budgetary).

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

THE NEED FOR ACCOUNTING INFORMATION

8 Accounting information on credit programs provides the basis for evaluating program performance by comparing actual accounting data with estimated budget data. Budget analysts and decision-makers can use accounting information to compare actual cash flows with projected cash flows and actual costs of direct loans and loan guarantees with their estimated costs.

9 For credit program managers, information on estimated default losses and related liabilities, when recognized in a timely manner, can be an important tool in evaluating credit program performance. The information can help determine a credit program's overall financial condition and identify its financing needs.

10 Furthermore, cost and performance information on loans and loan guarantees maintained by COHORT and RISK CATEGORY can highlight those groups that are not expected to meet budget estimates because of increased risk. Based on such information, program managers can take timely action to reduce costs, control risks where possible, and improve credit program performance.

PRESENT VALUE ACCOUNTING

11 The Federal Credit Reform Act of 1990 requires that effective October 1, 1991, the cost of direct loans and loan guarantees be estimated at present value for the budget. The objectives of using the present value measurement in federal credit reform are to measure, recognize, and control subsidy costs of direct loans and loan guarantees. [Footnote 2]

[Footnote 2: Congressional Budget Office, "Credit Reform: Comparable Budget Costs for Cash and Credit" (Dec. 1989), p. 33.]

12 For direct loans, the effect of using the present value measurement is to estimate the extent of the disbursed amounts that would be recovered, and the extent of the disbursed amounts that is a subsidy cost. The portion that

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

can be recovered is the present value of projected net cash inflows discounted at the Treasury rate of similar maturity. This portion is not considered a cost to the government because it is expected to be returned to the government in future amounts. The remaining portion of the cash disbursement represents a cost to the government, resulting either from lending at a rate lower than the Treasury interest rate, or from default losses, or both.

13 Under credit reform, the subsidy portion of direct loans is financed by appropriations, and the unsubsidized portion of the loans, which equals the present value of the government collections from the borrowers, is financed with funds borrowed from Treasury. The subsidy cost of loans must be REESTIMATED and updated annually.

14 The present value measurement basis is also applied to loan guarantees. Before credit reform, as in the case of direct loans, loan guarantees were measured for the budget on a cash basis. Thus, loan guarantees could appear to be virtually cost free, since cash payments by the government were not required unless and until the guaranteed loans defaulted at a future date. Under credit reform, the future cash outflows required by LOAN GUARANTEE COMMITMENTS must be projected and discounted at an appropriate Treasury interest rate. The present value of the cash outflows is the cost of the loan guarantees. Before loan guarantees are committed, annual appropriations generally must be enacted to cover the cost of the loan guarantees.

FINANCIAL REPORTING

15 The Board believes that present value measurement should be adopted for financial accounting and reporting on direct loans and loan guarantees that have been or will be obligated or committed after September 30, 1991. Since the Act requires that the costs of these POST-1991 DIRECT LOANS AND LOAN GUARANTEES be estimated at present value for budget purposes, financial reports on actual results measured at present value can be used as feedback to compare with budget estimates. Such comparisons can be used as a basis to improve future estimates and REESTIMATES.

16 The Board recognizes that effective use of the present value accounting method depends on accurate projections of future cash flows over the life of direct or

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

guaranteed loans. The efforts to make accurate projections should begin with establishing and using reliable records of historical credit performance data, and should take into consideration current and forecasted economic conditions.

17 The Board recognizes the value of having financial accounting support the budget. It endorses the logic underlying credit reform, and it recommends that accounting standards for credit be consistent with budgeting under credit reform. The Board is aware that as more experience is gained, some modifications may be made in budgetary requirements. It is the intention of the Board that so long as the modifications are made on a credit reform basis and do not materially affect the basic recognition and measurement principles embodied in the accounting standards, accounting practices for direct loans and loan guarantees should change as needed in order to be consistent with the budget.

18 The Board considered the expected costs and efforts that would be required in restating PRE-1992 DIRECT LOANS AND LOAN GUARANTEES at present value. Based on this consideration, the standards permit but do not require restating those loans and loan guarantees on a present value basis.

19 The standards were proposed in an Exposure Draft issued in September 1992. Comments were received from 36 organizations and individuals. Oral comments were also presented at a meeting by representatives of federal agencies with major credit programs. The Board considered all the comments received and incorporated changes, as appropriate. Issues raised by those who responded to the Exposure Draft and the Board's conclusions are presented in Appendix A, Basis of the Board's Conclusions.

EFFECTIVE DATE

20 The FASAB recommends that the accounting standards recommended in this Statement become effective for fiscal years ending September 30, 1994, and thereafter. An earlier implementation is encouraged.

****

THE ACCOUNTING STANDARDS

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

EXPLANATION

21 These standards concern the recognition and measurement of direct loans, the liability associated with loan guarantees, and the cost of direct loans and loan guarantees. The standards apply to direct loans and loan guarantees on a group basis, such as a cohort or a risk category of loans and loan guarantees. Present value accounting does not apply to direct loans or loan guarantees on an individual basis, except for a direct loan or loan guarantee that constitutes a cohort or a risk category.

ACCOUNTING STANDARDS

Post-1991 Direct Loans

22 Direct loans disbursed and outstanding are recognized as assets at the present value of their estimated net cash inflows. The difference between the outstanding principal of the loans and the present value of their net cash inflows is recognized as a subsidy cost allowance.

Post-1991 Loan Guarantees

23 For guaranteed loans outstanding, the present value of estimated net cash outflows of the loan guarantees is recognized as a liability. Disclosure is made of the face value of guaranteed loans outstanding and the amount guaranteed.

Subsidy Costs of Post-1991 Direct Loans and Loan Guarantees

24 For direct or guaranteed loans disbursed during a fiscal year, a subsidy expense is recognized. The amount of the subsidy expense equals the present value of estimated cash outflows over the life of the loans minus the present value of estimated cash inflows, discounted at the interest rate of marketable Treasury securities with a similar maturity term, applicable to the period during which the loans are disbursed (hereinafter referred to as the applicable Treasury interest rate).

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

25 For the fiscal year during which new direct or guaranteed loans are disbursed, the components of the subsidy expense of those new direct loans and loan guarantees are recognized separately among interest subsidy costs, default costs, fees and other collections, and other subsidy costs.

26 The interest subsidy cost of direct loans is the excess of the amount of the loans disbursed over the present value of the interest and principal payments required by the loan contracts, discounted at the applicable Treasury rate. The interest subsidy cost of loan guarantees is the present value of estimated interest supplement payments.

27 The default cost of direct loans or loan guarantees results from any anticipated deviation, other than prepayments, by the borrowers from the payments schedule in the loan contracts. The deviations include delinquencies and omissions in interest and principal payments. The default cost is measured at the present value of the projected payment delinquencies and omissions minus net recoveries. Projected net recoveries include the amounts that would be collected from the borrowers at a later date or the proceeds from the sale of acquired assets minus the costs of foreclosing, managing, and selling those assets.

28 The present value of fees and other collections is recognized as a deduction from subsidy costs.

29 Other subsidy costs consist of cash flows that are not included in calculating the interest or default subsidy costs, or in fees and other collections. They include the effect of prepayments within contract terms.

Subsidy Amortization and Reestimation

30 The subsidy cost allowance for direct loans is amortized by the INTEREST METHOD using the interest rate that was originally used to calculate the present value of the direct loans when the direct loans were disbursed. The amortized amount is recognized as an increase or decrease in interest income.

31 Interest is accrued and compounded on the liability

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

of loan guarantees at the interest rate that was originally used to calculate the present value of the loan guarantee liabilities when the guaranteed loans were disbursed. The accrued interest is recognized as interest expense.

32 The subsidy cost allowance for direct loans and the liability for loan guarantees are reestimated each year as of the date of the financial statements. Since the allowance or the liability represents the present value of the net cash outflows of the underlying direct loans or loan guarantees, the reestimation takes into account all factors that may have affected the estimate of each component of the cash flows, including prepayments, defaults, delinquencies, and recoveries. Any increase or decrease in the subsidy cost allowance or the loan guarantee liability resulting from the reestimates is recognized as a subsidy expense (or a reduction in subsidy expense). Reporting the subsidy cost allowance of direct loans (or the liability of loan guarantees) and reestimates by component is not required.

Criteria for Default Cost Estimates

33 The criteria for default cost estimates provided in this and the following paragraphs apply to both initial estimates and subsequent reestimates. Default costs are estimated and reestimated for each program on the basis of separate cohorts and risk categories. The reestimates take into account the differences in past cash flows between the projected and realized amounts and changes in other factors that can be used to predict the future cash flows of each risk category.

34 In estimating default costs, the following risk factors are considered: (1) loan performance experience; (2) current and forecasted international, national, or regional economic conditions that may affect the performance of the loans; (3) financial and other relevant characteristics of borrowers; (4) the value of collateral to loan balance; (5) changes in recoverable value of collateral; and (6) newly developed events that would affect the loans' performance. Improvements in methods to reestimate defaults are also considered.

35 Each credit program should use a systematic methodology, such as an econometric model, to project

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

default costs of each risk category. If individual accounts with significant amounts carry a high weight in risk exposure, an analysis of the individual accounts is warranted in making the default cost estimate for that category.

36 Actual historical experience of the performance of a risk category is a primary factor upon which an estimation of default cost is based. To document actual experience, a data base should be maintained to provide historical information on actual payments, prepayments, late payments, defaults, recoveries, and amounts written off.

Revenues and Expenses

37 Interest accrued on direct loans, including amortized interest, is recognized as interest income. Interest accrued on the liability of loan guarantees is recognized as interest expense. Interest due from Treasury on uninvested funds is recognized as interest income. Interest accrued on debt to Treasury is recognized as interest expense.

38 Costs for administering credit activities, such as salaries, legal fees, and office costs, that are incurred for credit policy evaluation, loan and loan guarantee origination, closing, servicing, monitoring, maintaining accounting and computer systems, and other credit administrative purposes, are recognized as administrative expense. Administrative expenses are not included in calculating the subsidy costs of direct loans and loan guarantees.

Pre-1992 Direct Loans and Loan Guarantees

39 The losses and liabilities of direct loans obligated and loan guarantees committed before October 1, 1992, are recognized when it is more likely than not that the direct loans will not be totally collected or that the loan guarantees will require a future cash outflow to pay default claims. The allowance of the uncollectible amounts and the liability of loan guarantees should be reestimated each year as of the date of the financial statements. In estimating losses and liabilities, the risk factors

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

discussed in the previous section should be considered. Disclosure is made of the face value of guaranteed loans outstanding and the amount guaranteed.

40 Restatement of pre-1992 direct loans and loan guarantees on a present value basis is permitted but not required.

Modification of Direct Loans and Loan Guarantees

41 The term modification means a federal government action, including new legislation or administrative action, that directly or indirectly alters the estimated subsidy cost and the present value of outstanding direct loans, or the liability of loan guarantees.

42 Direct modifications are actions that change the subsidy cost by altering the terms of existing contracts or by selling loan assets. Existing contracts may be altered through such means as forbearance, forgiveness, reductions in interest rates, extensions of maturity, and prepayments without penalty. Such actions are modifications unless they are considered reestimates, or workouts as defined below, or are permitted under the terms of existing contracts.

43 Indirect modifications are actions that change the subsidy cost by legislation that alters the way in which an outstanding portfolio of direct loans or loan guarantees is administered. Examples include a new method of debt collection prescribed by law or a statutory restriction on debt collection.

44 The term modification does not include subsidy cost reestimates, the routine administrative workouts of troubled loans, and actions that are permitted within the existing contract terms. Workouts are actions taken to maximize repayments of existing direct loans or minimize claims under existing loan guarantees. The expected effects of work-outs on cash flows are included in the original estimate of subsidy costs and subsequent reestimates.

A. MODIFICATION OF DIRECT LOANS

45 With respect to a direct or indirect modification

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

of pre-1992 or post-1991 direct loans, the cost of modification is the excess of the PRE-MODIFICATION VALUE [Footnote 3] of the loans over their POST-MODIFICATION VALUE [Footnote 4] The amount of the modification cost is recognized as a modification expense when the loans are modified.

[Footnote 3: The term pre-modification value is the present value of the net cash inflows of direct loans estimated at the time of modification under pre-modification terms and discounted at the interest rate applicable to the time when the modification occurs on marketable Treasury securities that have a comparable maturity to the remaining maturity of the direct loans under pre-modification terms (simply stated, the pre-modification terms at the current rate).]

[Footnote 4: The term post-modification value is the present value of the net cash inflows of direct loans estimated at the time of modification under post-modification terms and discounted at the interest rate applicable to the time when the modification occurs on marketable Treasury securities that have a comparable maturity to the remaining maturity of the direct loans under post-modification terms (simply stated, the post-modification terms at the current rate).]

46 When post-1991 direct loans are modified, their existing BOOK VALUE is changed to an amount equal to the present value of the loans' net cash inflows projected under the modified terms from the time of modification to the loans' maturity and discounted at the ORIGINAL DISCOUNT RATE (the rate that is originally used to calculate the present value of the direct loans, when the direct loans were disbursed).

47 When pre-1992 direct loans are directly modified, they are transferred to a financing account and their book value is changed to an amount equal to their post-modification value. Any subsequent modification is treated as a modification of post-1991 loans. When pre-1992 direct loans are indirectly modified, they are kept in a liquidating account. Their bad debt allowance is reassessed and adjusted to reflect amounts that would not be collected due to the modification.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

48 The change in book value of both pre-1992 and post-1991 direct loans resulting from a direct or indirect modification and the cost of modification will normally differ, due to the use of different discount rates or the use of different measurement methods. Any difference between the change in book value and the cost of modification is recognized as a gain or loss. For post-1991 direct loans, the MODIFICATION ADJUSTMENT TRANSFER [Footnote 5] paid or received to offset the gain or loss is recognized as a financing source (or a reduction in financing source).

[Footnote 5: OMB instructions provide that if the decrease in book value exceeds the cost of modification, the reporting entity receives from the Treasury an amount of modification adjustment transfer equal to the excess; and that if the cost of modification exceeds the decrease in book value, the reporting entity pays to the Treasury an amount of modification adjustment transfer to offset the excess. (See OMB Circular A-11.)]

B. MODIFICATION OF LOAN GUARANTEES

49 With repsect to a direct or indirect modification of pre-1992 or post-1991 loan guarantees, the cost of modification is the excess of the POST-MODIFICATION LIABILITY [Footnote 6] of the loan guarantees over their PRE-MODIFICATION LIABILITY.[Footnote 7] The modification cost is recognized as modification expense when the loan guarantees are modified.

[Footnote 6: The term post-modification liability is the present value of the net cash outflows of the loan guarantees estimated at the time of modification under the post-modification terms, and discounted at the interest rate applicable to the time when the modification occurs on marketable Treasury securities that have a comparable maturity to the remaining maturity of the guaranteed loans under post-modification terms (simply stated, the post-modification terms at the current rate).]

[Footnote 7: The term "pre-modification liability" is the present value of the net cash outflows of loan guarantees estimated at the time of modification under the pre-modification terms and discounted at the interest rate applicable to the time when the modification occurs on

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

marketable Treasury securities that have a comparable maturity to the remaining maturity of the guaranteed loans under pre-modification terms (simply stated, the pre-modification terms at the current rate.)

50 The existing book value of the liability of modified post-1991 loan guarantees is changed to an amount equal to the present value of net cash outflows projected under the modified terms from the time of modification to the loans' maturity, and discounted at the original discount rate (the rate that is originally used to calculate the present value of the liability when the guaranteed loans were disbursed).

51 When pre-1992 loan guarantees are directly modified, they are transferred to a financing account and the existing book value of the liability of the modified loan guarantees is changed to an amount equal to their post-modification liability. Any subsequent modification is treated as a modification of post-1991 loan guarantees. When pre-1992 direct loan guarantees are indirectly modified, they are kept in a liquidating account. The liability of those loan guarantees is reassessed and adjusted to reflect any change in the liability resulting from the modification.

52 The change in the amount of liability of both pre-1992 and post-1991 loan guarantees resulting from a direct or indirect modification and the cost of modification will normally differ, due to the use of different discount rates or the use of different measurement methods. Any difference between the change in liability and the cost of modification is recognized as a gain or loss. For post-1991 loan guarantees, the modification adjustment transfer [Footnote 8] paid or received to offset the gain or loss is recognized as a financing source (or a reduction in financing source).

[Footnote 8: OMB instructions provide that if the increase in liability exceeds the cost of modification, the reporting entity receives from the Treasury an amount of modification adjustment transfer equal to the excess; and that if the cost of modification exceeds the increase in liability, the reporting entity pays to the Treasury an amount of modification adjustment transfer to offset the excess. (See OMB Circular A-11.)]

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

C. SALE OF LOANS

53 The sale of post-1991 and pre-1992 direct loans is a direct modification. The cost of modification is determined on the basis of the pre-modification value of the loans sold. If the pre-modification value of the loans sold exceeds the net proceeds from the sale, the excess is the cost of modification, which is recognized as modification expense.

54 For a loan sale with RECOURSE, potential losses under the recourse or guarantee obligations are estimated, and the present value of the estimated losses from the recourse is recognized as subsidy expense when the sale is made and as a loan guarantee liability.

55 The book value loss (or gain) on a sale of direct loans equals the existing book value of the loans sold minus the net proceeds from the sale. Since the book value loss (or gain) and the cost of modification are calculated on different bases, they will normally differ. Any difference between the book value loss (or gain) and the cost of modification is recognized as a gain or loss. [Footnote 9] For sales of post-1991 direct loans, the modification adjustment transfer [Footnote 10] paid or received to offset the gain or loss is recognized as a financing source (or a reduction in financing source).

[Footnote 9: If there is a book value gain, the gain to be recognized equals the book value gain plus the cost of modification.]

[Footnote 10: See footnote No. 5 for an explanation of modification adjustment transfer.

D. DISCLOSURE

56 Disclosure is made in notes to financial statements to explain the nature of the modification of direct loans or loan guarantees, the discount rate used in calculating the modification expense, and the basis for recognizing a gain or lose related to the modification.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

Foreclosure of Post-1991 Direct Loans and Guaranteed Loans

57 When property is transferred from borrowers to a federal credit program, through FORECLOSURE or other means, in partial or full settlement of post-1991 direct loans or as a compensation for losses that the government sustained under post-1991 loan guarantees, the foreclosed property is recognized as an asset at the present value of its estimated future net cash inflows discounted at the original discount rate.

58 If a legitimate claim exists by a third party or by the borrower to a part of the recognized value of the foreclosed assets, the present value of the estimated claim is recognized as a special contra valuation allowance.

59 At a foreclosure of guaranteed loans, a federal guarantor may acquire the loans involved. The acquired loans are recognized at the present value of their estimated net cash inflows from selling the loans or from collecting payments from the borrowers, discounted at the original discount rate.

60 When assets are acquired in full or partial settlement of post-1991 direct loans or guaranteed loans, the present value of the government's claim against the borrowers is reduced by the amount settled as a result of the foreclosure.

Write-off of Direct Loans

61 When post-1991 direct loans are written off, the unpaid principal of the loans is removed from the gross amount of loans receivable. Concurrently, the same amount is charged to the allowance for subsidy costs. Prior to the WRITE-OFF, the uncollectible amounts should have been fully provided for in the subsidy cost allowance through the subsidy cost estimate or reestimates. Therefore, the write-off would have no effect on expenses.

****

APPENDIX A: BASIS OF THE BOARD'S CONCLUSIONS

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

PRESENT VALUE ACCOUNTING

62 Several respondents were opposed to using present value accounting for direct loans and loan guarantees. They pointed out that although the Federal Credit Reform Act of 1990 requires the use of present value to measure the subsidy costs of direct loans and loan guarantees for the budget, the law does not require using present value for financial reporting. They believed that since there are no legal requirements, the adoption of present value accounting should be based on cost-benefit considerations.

63 These respondents emphasized the complexity and cost of implementing and maintaining present value accounting. Because of the need to separately account for the direct loans or loan guarantees obligated or committed by each credit program in a fiscal year by cohort, as years go by, the number of cohorts would multiply. An agency with a number of loan and loan guarantee programs estimated that within 5 years, there would be more than 200 cohorts, one for each year and each program. Since most of its loans are long-term, maturing in 30 or more years, the number of cohorts would be staggering.

64 The respondents who were opposed to present value accounting doubted whether there would be any significant improvement in financial information on loans and loan guarantees reported on a present value basis compared with information traditionally reported on a nominal value basis. They contended that both present value accounting and nominal value accounting rely on historical experience and management judgment to evaluate risk as the primary variable in determining a default allowance. They further argued that since present value calculations involve cash flow estimates over future years, information based on the estimates is not necessarily more reliable than information reported under the nominal value accounting method.

65 A number of respondents expressed support of the Board's proposal to use present value accounting for direct loans and loan guarantees. They believed that it is a positive step to bring budgeting and financial reporting together. They also believed that implementation of the proposed standards would present useful information for monitoring programs with direct loans and loan guarantees.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

66 In proposing present value accounting, the Board's primary considerations were to carry out the intent of the Federal Credit Reform Act of 1990 and to make financial reporting compatible with the budget. (See Exposure Draft, Vol. 1, par. 15.) The Board believes that one of the objectives of financial reporting is to enable the reader to determine the status of budgetary resources, and whether those resources were acquired and used in accordance with the enacted budget. [Footnote 11]

[Footnote 11: FASAB Exposure Draft, Objectives of Federal Financial Reporting, Vol. 1, par. 13.]

67 The Federal Credit Reform Act of 1990 requires using present value for the budget. The Board does not believe that this requirement should be ignored for financial reporting. Since budgetary resources for direct loan and loan guarantee subsidies are provided on a present value basis, financial reporting on the acquisition, use, and status of the resources should be on the same basis. Only by using the same basis can financial information be used to compare the actual results with the budget.

68 Indeed, distortion in information would result if present value were not used to report direct loans or loan guarantees that are budgeted on a present value basis. This can be illustrated by the following example.

69 Suppose a group of 5-year term loans in the aggregate amount of $100,000 were disbursed by a federal credit program at the end of fiscal year 1992. The loans require paying an annual interest of 5 percent and repaying the principal in fiscal year 1997. It was estimated that the interest would be collected each year, but only $80,000 of the principal would be repaid when the loans mature. During the year the loans were disbursed, the average interest rate of Treasury securities of the same maturity was 9 percent.

70 Based on the cash flow projection shown in Table 1 below, at the end of the 1992 fiscal year, the present value of the direct loans was $71,440 and the loans' subsidy cost was $28,560. It is assumed in this example, that as required by credit reform, the subsidy cost ($28,560) was funded with appropriations, and the remaining amount ($71,440) was financed with borrowing from Treasury at 9 percent.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

TABLE 1: THE PRESENT VALUE OF DIRECT LOANS

FISCAL YEARS	EXPECTED PAYMENTS
1993	$ 5,000
1994	5,000
1995	5,000
1996	5,000
1997	$85,000
Present value at 9%	$71,440

71 If the nominal value accounting method were used in financial reporting, the $20,000 of the principal that was estimated to be uncollectible would have been reported as a bad debt expense. The estimated uncollectible amount of $20,000 would have been recognized as the cost of the loans in financial statements. In reality, however, the agency spent $28,560 of budgetary resources to fund the cost of the loans.

72 Also, if the nominal value accounting method were used, the loans as assets would have been reported at $80,000 at the end of the 1992 fiscal year, which equals the $100,000 principal of the loans minus an allowance of $20,000 for the uncollectible amount. On the other hand, debt to Treasury would have been reported at $71,440, which was the amount actually borrowed to finance the loans. The financial information would have shown an excess of the assets over the liability by $8,560. In reality, however, even if the default estimate was correct, the entire collection of interest and principal would be used to pay interest and principal to Treasury. The credit program in fact would have no excess in assets. The following is a comparison of the loans reported on a present value basis and on a nominal value basis. [Footnote 12]

[Footnote 12: Tables are provided only for illustration. They do not represent a reporting format.]

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

TABLE 2: REPORTING ON THE DIRECT LOANS AT PRESENT VALUE ON SEPTEMBER 30, 1992

ASSETS:		LIABILITIES:	
Loans receivable	$100,000	Debt to Treasury	$71,440
Subsidy cost allowance	(28,560)		
Loans receivable, Net	$ 71,440		
		Net Position:	$0

TABLE 3: REPORTING ON THE DIRECT LOANS AT NOMINAL VALUE ON SEPTEMBER 30, 1992

ASSETS:		LIABILITIES:	
Loans receivable	$100,000	Debt to Treasury	$71,440
Allowance for bad debts	(20,000)		
Loans receivable, Net	$ 80,000		
		Net Position:	$ 8,560

73 A similar distortion would result in reporting loan guarantees. The distortion would be caused by reporting loan guarantee liabilities on a nominal value basis, whereas the budgetary resources received to finance the liabilities are measured at a present value basis.

74 In evaluating efforts and costs of implementing present value accounting for post-1991 direct loans and loan guarantees, one should keep in mind that the federal direct loan and loan guarantee programs have modified or will have to modify their accounting systems in order to implement the budgeting requirements of the Federal Credit Reform Act of 1990. They will have to maintain data by cohort and risk category, compute interest on borrowing from Treasury and on uninvested funds, and make subsidy estimates and reestimates. The accounting standards provided in this statement do not require more than the budget process requires in these respects, and thus they would not result in a substantial amount of additional effort or cost.

75 Some respondents indicated that it would be

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

burdensome if present value accounting were to be implemented on a loan-by-loan (or transaction) basis. The Board does not propose that the accounting standards be implemented on a loan-by-loan basis. The standards should apply to a cohort (or risk category) of direct loans or loan guarantees in the aggregate.

76 In addition to making financial reporting consonant with the budget, the Board also believes that the standards proposed in the Exposure Draft will produce better financial information for the following reasons:

77 First, the proposed standards would require measuring and recognizing the subsidy costs of direct loans and loan guarantees at their inception rather than at a later date. The current accounting practice does not require this. In the absence of this requirement, the cost of direct loans is not recognized when the loans are disbursed, and the liability to pay claims under loan guarantees is not usually recognized when guaranteed loans are disbursed.

78 Second, the proposed standards would require a comprehensive evaluation of future cash flows over the life of direct loans and guaranteed loans, including payments of interest, principal, fees, prepayments, defaults, delinquencies, and recoveries. The current accounting practice typically provides an allowance for the portion of the principal that would not be collected. It does not take into account the impact of other cash flow elements.

79 Third, the proposed standards would require discounting the net cash flows at the government's borrowing rate on marketable Treasury securities. Discounting is a basic feature of present value accounting that measures and recognizes the interest subsidy cost of direct loans and loan guarantees, and the time value of all cash flows. The time value of such cash flows is not accounted for under the nominal value accounting method, and the interest subsidy cost is not accounted for when the loans are disbursed.

80 Finally, the proposed standards would require an annual systematic review of the projected cash flows. The projections would be revised and updated to reflect newly developed events, changes in economic conditions, and better understanding of the factors that cause defaults. The subsidy costs would be reestimated accordingly. The

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

reestimation requirement assures that credit programs maintain an up-to-date data base by cohort and risk category of actual collections, defaults, and amounts written off on federal loans and loan guarantees. Such a complete data base was not available prior to credit reform.

81 In summary, the recognition of cost at inception, the comprehensive evaluation of all future cash flows, and the discounting of future cash flows to present value are complementary elements at the core of present value accounting. When taken together, they place an economic value on the cost the federal government incurs in making direct loans and loan guarantees. Likewise, they place an economic value rather than a nominal value on loan assets and loan guarantee liabilities.

82 Based on the view that financial accounting should be compatible with the budget, and based on the other advantages of using the present value accounting, the Board has concluded that the present value accounting method should be used in the accounting standards for post-1991 direct loans and loan guarantees.

SUBSIDY COST COMPONENT

83 The Exposure Draft proposed that when direct or guaranteed loans are disbursed, their subsidy expense be recognized separately among interest subsidy costs, default costs, fees (as a deduction from the costs), and other subsidy costs.

84 The Exposure Draft also proposed the following requirement: The interest subsidy allowance shall be amortized using the interest method. Compound interest shall be accumulated on the allowances for default losses, fees, and other cost components.

85 The Exposure Draft posed a question: Should the subsidy cost components, if material, be recognized separately in financial reporting? Some respondents agreed that the subsidy cost components should be separately recognized. They believed that separate recognition would provide the level of detail needed to understand the program better and improve their component estimates for budget formulation.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

86 Some respondents were opposed to reporting subsidy costs by component on the grounds that (1) only the aggregate amount of subsidy costs is needed for budget execution purposes, (2) information on cost components may not be used by management, and (3) the cost of complex record-keeping and calculations outweigh the benefit.

87 After considering the benefits and efforts required in accounting for subsidy cost components, the Board has concluded that when direct or guaranteed loans are disbursed, the subsidy expense of the direct loans or loan guarantees should be recognized in separate components. The Board believes that by reporting the subsidy expense components of direct or guaranteed loans disbursed during the reporting year, the cost components of newly disbursed direct loans and loan guarantees can be compared with those of prior years. The cost component information would be valuable for making credit policy decisions, monitoring portfolio quality, and improving credit performance. Information on interest subsidies and fees would help in making decisions on setting interest rates and fee levels. Information on default costs would help in evaluating credit performance.

88 In calculating the present value of the subsidy costs for the budget, agencies must first develop data on cash flow components. OMB requires agencies to use the OMB credit subsidy model, which takes these cash flows as inputs and automatically calculates the components of the subsidy cost. Since the information on subsidy cost components of new direct loans and loan guarantees is available, reporting the information would not require significant additional efforts.

89 However, the Board realizes that it would require considerable efforts to maintain records for the present value of cost components for each existing cohort of loans and loan guarantees, amortize or accumulate interest on each component each year, adjust each component each year for reestimates, and, if applicable, adjust each component for modifications when they occur. After considering the efforts that would be required and the benefits that could be derived, the Board decided not to recommend the requirement to amortize or accumulate interest on each subsidy cost component. Without this requirement, credit programs may

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

amortize the subsidy allowance of each cohort in aggregate, using the interest method. They would not have to maintain records for the present value of each cost component and adjust them annually. This would greatly ease the record-keeping and calculation burden.

90 By eliminating the requirement to amortize and accumulate interest on each component of the subsidy cost allowance, the Board realizes that information would not be available to track changes in the present values of the components. However, data would still be available to track changes in the total amount of a cohort's subsidy allowance affected by annual reestimates. The primary factor that causes changes in the subsidy allowance would be default reestimates. Furthermore, the Board believes that it is of a critical importance that each credit program maintain a data base for actual collections, defaults, delinquencies, and recoveries. For purposes of monitoring program performance and estimating future losses, the actual default and collection data base is more important than tracking changes in the allowance for the present value of subsidy costs by component. The actual default and collection data base is also necessary for estimating and reestimating subsidy costs.

ACCOUNTING FOR FEES

91 In the Exposure Draft, the Board proposed that the present value of estimated fee receipts be recognized as a deduction from the subsidy expense. The Board posed a question: How should fees be recognized on an entity's financial reports? Should they be recognized as a deduction of subsidy expense, or as a revenue?

92 Many respondents agreed with the proposal that the present value of estimated fee collections be recognized as a deduction of subsidy expense. Some respondents contended that fees should be recognized as a revenue rather than as an expense component. They stated that offsetting revenues against expenses would not provide clear revenue/expense information concerning the operating results of a credit program. Some of the respondents also said that to the extent some of the fees are used to defray administrative costs, they should not offset subsidy expenses because the Federal Credit Reform Act of 1990 excludes administrative

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

costs from subsidy expenses.

93 The Board is not persuaded by the arguments that fees should be reported as a revenue. The subsidy expense of direct loans and loan guarantees is the focal point of credit reform, and it is measured as the present value of the net cash flows of the direct loans and loan guarantees. Since the estimated fees are a component of the cash flows, the Board believes that the present value of fees should be reported as a component of the subsidy expense. Since the Board has concluded that all of the subsidy expense components, including the present value of fees, are to be reported separately, reporting the present value of fees as an expense component would not reduce information on the collection of fees. Furthermore, the administrative expenses that are excluded from subsidy costs are often covered by appropriations, rather than paid by fee collections. Thus, it is not necessary to allocate a portion of the fee collections to pay the administrative costs that are not a part of the subsidy costs.

PRE-1992 DIRECT LOANS AND LOAN GUARANTEES

94 The phrase pre-1992 direct loans and loan guarantees refers to direct loans obligated and loan guarantees committed before October 1, 1991, the effective date of the Federal Credit Reform Act of 1990. In the Exposure Draft, the Board did not recommend restating pre-1992 direct loans and loan guarantees at present value. The Board's position was that the costs of restating those direct loans and loan guarantees would outweigh the benefits.

95 Most respondents who commented on this issue agreed with the Board's position. They emphasized that the restatement of pre-1992 direct loans and loan guarantees would be a complex process and would require substantial resources. They pointed out that a major difficulty is caused by the lack of complete and accurate historical data that a restatement needs to be based upon. Because of the lack of accurate data, even if the agencies incurred a great deal of cost, the restated loans and loan guarantees could not be accurately compared with post-1991 loans and loan guarantees on the same basis. The respondents pointed out that since the pre-1992 direct loans and loan guarantees

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

were obligated or committed in the past, restated information would be of limited usefulness to current budget decisions. They also pointed out that the amount of pre-1992 direct loans and loan guarantees outstanding would diminish over time as loans matured, defaulted, or were modified.

96 In addition to considering the comments on the Exposure Draft, the Board also considered the findings of a GAO report presented to the Board. [Footnote 13] The GAO report suggested that by not requiring a restatement of pre-1992 direct loans and loan guarantees at present value, poor information would be perpetuated, which could affect the ability to (1) forecast the future budgetary impact of pre-credit reform credit activity, (2) minimize losses, and (3) judge the reasonable accuracy of subsidy estimates for post-1991 credit. The GAO report recommended using simplified methods, such as sampling techniques, to restate pre-1992 direct loans and loan guarantees at present value.

[Footnote 13: GAO Report to the Chairman, Senate Budget Committee, Federal Credit Programs: Agencies Had Serious Problems Meeting Credit Reform Accounting Requirements (GAO/AFMD-93-17, Jan. 1993).]

97 However, there was a strong indication in the comments the Board received and in the findings of the GAO report that agencies have been experiencing serious difficulties in implementing the credit reform requirements related to post-1991 direct loans and loan guarantees. A restatement of pre-1992 direct loans and loan guarantees, even on a sampling basis, would require additional use of the agencies' limited accounting resources. The Board also agrees with the view that as the pre-1992 direct and guaranteed loans are approaching their maturity and are paid off, liquidated, or written off, the difference between their present value and nominal value becomes less significant. Thus, the Board concludes that it is appropriate not to require restating pre-1992 direct loans and loan guarantees at present value.

98 The Department of Veterans Affairs stated in its comments that it had accounted for pre-1992 loan guarantees on a present value basis. The Department of Education indicated in its comments that it planned to report pre-1992 loans on a present value basis. Their efforts to account for pre-1992 loans and loan guarantees at present value,

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

although not at the same level of detail as required by credit reform, could very well result in improved information for credit management. Other agencies may follow their examples. The Board believes that reporting those pre-1992 direct loans and loan guarantees on a present value basis should be permitted.

99 Although a restatement of pre-1992 direct loans and loan guarantees at present value is not required, the Board continues to believe that it is of fundamental importance to estimate and recognize losses and liabilities for those direct loans and loan guarantees. Loss estimation and recognition are necessary to support federal government financial planning and management. The information on both current and potential liabilities related to federal credit programs alerts Congress and federal officials to the long-term costs and future financing needs.

100 The recommended standards would require that losses of pre-1992 direct loans and liabilities related to pre-1992 loan guarantees be recognized when it is more likely than not that the loans will not be totally collected or the loan guarantees will require a future cash outflow to pay default claims. This is the same standard that the Board recommended for the recognition of losses on receivables in FASAB Statement of Recommended Accounting Standards No. 1, Accounting for Selected Assets and Liabilities.

101 The Board believes that each loan guarantee program should disclose the aggregate amount of outstanding guaranteed loans. In addition, it should also disclose its risk exposure, which is the guaranteed portion of the total outstanding guaranteed loans.

MODIFICATIONS

102 A modification is a government action that alters the estimated subsidy cost of outstanding direct loans or loan guarantees. Both a government action and an alteration in subsidy cost are necessary conditions for a modification. A subsidy reestimate is not a modification.

103 Direct modifications change the subsidy cost by legislation or administrative actions that alter the terms of existing contracts or by selling loan assets. Existing

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

contracts may be altered by such means as forgiveness, forbearance, reductions in interest rates, extensions of maturity, and prepayments without penalty. Such actions are modifications unless they are considered workouts as explained below or are permitted by the existing contract terms.

104 Indirect modifications change the subsidy cost by legislation that alters the way in which an outstanding portfolio of direct loans or loan guarantees is administered. Examples include a new method of debt collection prescribed by law or a statutory restriction on debt collection. Such new legislation would produce a one-time effect on the subsidy cost of outstanding direct loans and loan guarantees only. After the enactment of the legislation, the effects of the legislation are included in the original subsidy cost estimates of newly obligated direct loans and newly committed loan guarantees. Thus, the legislation is not a modification with respect to direct loans obligated and loan guarantees committed subsequent to its enactment.

105 The term modification does not include the routine administrative work-outs of troubled loans or loans in imminent default. Work-outs are actions undertaken to maximize the repayments to the government under existing direct loans or to minimize claim payments that the government would make under loan guarantees. The expected effects of work-outs on cash flows are included in the original estimate and the reestimates of the subsidy cost. Therefore, a workout effort is not a government action that alters the estimated subsidy cost of direct loans or loan guarantees.

106 The term modification also does not include actions that are permitted within the existing contract terms, such as prepayments without penalty permitted by existing loan contracts. The expected effects of such actions on cash flows are included in the original estimate and the reestimates of the subsidy cost.

107 Neither the term modification nor the term workout includes additional disbursements to borrowers that increase the amount of direct loans outstanding. These disbursements are considered to be new loans in the amount of the increment.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

108 When direct loans and loan guarantees are modified, the subsidy cost of the modification must be calculated. The book value of the modified loans and the liabilities of the modified loan guarantees must be restated. The Exposure Draft used two types of discount rates to calculate the present values of post-1991 direct loans and loan guarantees that are modified: CURRENT DISCOUNT RATES and original discount rates.

109 The term current discount rate refers to the interest rate applicable to the time when the modification occurs on marketable Treasury securities that have a comparable maturity to the remaining maturity of the direct or guaranteed loans, under either pre-modification terms, or post-modification terms, whichever is appropriate. The cost of modification is measured as the excess of the present value of pre-modification net cash flows over the present value of post-modification cash flows, both discounted at a current discount rate. This is consistent with the measurement method described in OMB instructions.

110 The term original discount rate refers to the discount rate that is originally used to calculate the present value of the direct loans or the present value of loan guarantee liabilities, when the direct or guaranteed loans were disbursed. The value of modified loans or the liability of modified loan guarantees equals the present value of modified cash flows discounted at the original discount rate. The original discount rate is used to determine the value of modified loans because this is the interest rate that the Treasury charges on funds that it lends to the credit program to finance the loans. The original discount rate is also used to determine the liability of modified loan guarantees because this is the interest rate that the Treasury pays on funds that it holds for the credit program to pay future claims.

111 Because of using the two different rates, a difference will normally occur between the change in the book value of modified direct loans and the cost of the modification. In the case of loan guarantees, there will normally also be a difference between the change in the liability of modified loan guarantees and the cost of modification.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

112 The Exposure Draft used an example to illustrate the difference. [Footnote 14] The example used the original discount rate of 6 percent to calculate the book value of a modified loan, and it used the current discount rate of 8 percent to calculate the cost of modification. The calculations resulted in a difference between the change in book value and the cost of modification.

[Footnote 14: See Exposure Draft, Vol. 2, pars. 221 through 231, and Appendix 2, pages 139 through 143.]

113 OMB instructions require that an amount equal to the difference between the change in book value and the cost of modification either be returned to, or received from, the Treasury to offset the difference. The amount transferred to offset the difference is referred to in OMB instructions as the modification adjustment transfer. This transfer does not constitute a part of the cost of modification and is not a budget outlay or collection.

114 Several respondents objected to use of the current rate for measuring the modification cost. They believed that both the modification cost and the value of the modified loans (or the liability of modified loan guarantees) should be measured on the same basis, using the original discount rate. They said that by using the original discount rate for measuring both the cost and the book value or the liability, there would be no difference between the modification cost and change in book value (or change in loan guarantee liability). They argued that the additional computations at current discount rate do not result in any additional meaningful information for use by management. They contended that the complexity of the computation, the effect of changing discount rates, and the resulting difference between the change in book value and the cost of modification would only detract from management's ability to analyze the results of modification.

115 The Board realizes that it is undesirable to calculate the cost of modification and change in book value on different bases. Because the cost of modification and the book value are calculated on different bases, the modification expense recognized would not equal the decrease in the book value of direct loans (or the increase in the liability of loan guarantees) resulting from the modification.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

116 However, it is also undesirable to recognize a modification expense at a measurement basis that differs from the budget and appropriation basis. The OMB instructions concerning the definition and the cost of modification have carried a great weight on the Board's consideration of the subject. The OMB instructions require that the cost of modification be measured at the current rate, and appropriations approved for a modification will equal the cost of modification. The Board believes that financial reporting should reflect the modification cost recognized in the budget and the modification appropriations received.

117 The Board also appreciates the rationale in OMB instructions. The Federal Credit Reform Act of 1990 requires that the calculation of modification cost be based on the estimated present value of the direct loans or loan guarantees at the time of modification. This requirement has been interpreted as calculating the present value of modification cost at the discount rate applicable at the time of modification. The Board also agrees with the substantive rationale for using the current rate. By using the current rate, the calculation of the modification cost will reflect the economic cost of the modification at the time when the modification decision is made.

118 The Board found that some of the opposition to the use of the current rate for modifications arose because of a misunderstanding about the difference between modifications and work-outs. Once the distinction was clarified between work-outs (which are included in the initial subsidy estimates and are quantified using the original rates) and modifications (which require separate action as described, but are less frequent in occurrence), much of the opposition to using current rates for modifications disappeared.

119 In considering a solution for the measurement difference between the modification cost and the book value of the loan (or the loan guarantee liability), the Board has considered as an alternative whether the current rate could also be used to calculate the value of modified direct loans (or the liability of modified loan guarantees) so that the change in direct loan book value or loan guarantee liability could equal the cost of modification. The Board has decided against this for the two reasons explained below.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

120 First, under credit reform, the un-subsidized portion of direct loans is financed by funds borrowed from Treasury, while the subsidy cost of the direct loans is financed by appropriations. Thus, the carrying amount of direct loans at any point should equal the balance of debt to Treasury. Proceeds from collecting direct loan principal and interest will be used to repay debt to Treasury. This exact match between loan assets and liabilities (debt to Treasury) is a unique feature that makes credit reform loans and loan guarantees different from private sector lending.

121 When a modification occurs, the book value of the direct loans is affected. An amount of modification appropriation, plus or minus the modification adjustment transfer, would be used to reduce the debt to Treasury. By doing so, the book value of the modified loans and the balance of the debt to Treasury would continue to be equal. It is important to note that the interest rate on the debt to Treasury does not change as a result of the modification; it remains the original rate. Thus, the debt balance to Treasury in fact equals the present value of future payments to Treasury discounted at the original rate. Since the debt to Treasury is based on the original rate, that rate should also be used to calculate the book value of modified loans, so that the book value of the loans and the balance of debt to Treasury would be kept equal.

121 A parallel situation exists with loan guarantees. The financing account of each loan guarantee program maintains a fund balance with the Treasury equal to the liability of the loan guarantees. The fund balance and the liability grow at the same compound interest rate. The fund balance will accrue interest at the original rate applicable at the time the guaranteed loans were disbursed. The interest rate will not change because of a modification of the loan guarantees. Thus, only by measuring the liability of the modified loan guarantees at the original rate could the liability be kept equal to the fund balance.

122 Second, even if the current rate were used to calculate the book value of modified loans, the difference between the change in book value (or the change in liability balance) and the modification cost would not disappear. In measuring the change in book value (or the change in liability balance), the starting point is the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

pre-modification book value (or the pre-modification liability balance), which is based on the original discount rate. If the current rate is used to calculate the post-modification book value of modified direct loans, the change in book value would equal the difference between the pre-modification book value (based on the original rate) and the post-modification book value (based on the current rate). Similarly, if the current rate is used to calculate the post-modification balance of modified loan guarantee liabilities, the change in liability balance would equal the difference between the pre-modification balance (based on the original rate) and the post-modification balance (based on the current rate).

124 The cost of modification, on the other hand, is calculated differently. The starting point of the calculation is not the existing pre-modification book value of the modified loans (or the existing pre-modification book value of the liability of the modified loan guarantees). For both direct loans and loan guarantees, the calculation uses the present value of pre-modification net cash flows discounted at the current discount rate as the starting point. This pre-modification value differs from the existing pre-modification book value because the latter is based on the original discount rate. The cost of modification equals the difference between the present value of pre-modification net cash flows (discounted at the current rate) and the present value of post-modification net cash flows (also discounted at the current rate). Since the calculations take a different starting point, the cost of modification would not equal the change in book value.

125 Because of the two reasons above, the Board believes that the best solution available is to measure the cost of modification at the current discount rate, and to calculate the carrying amount of modified loans and loan guarantee liabilities at the original discount rate.

126 However, while it makes sense to determine the cost of modification based on the current discount rate, financial reporting cannot discard the pre-modification balance of direct loans or loan guarantee liabilities that are carried in the accounting records. Because of the use of different discount rates, the change in book value will be different from the cost of modification. The Board believes that the effect of a modification on assets or liabilities

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

should be reflected in the operating statement. The Board believes that in addition to recognizing the cost of modification as a modification expense, any difference between the change in book value and the modification expense should be recognized as a gain or loss. Thus, the net effect of the modification on the operating statement equals the decrease in loan assets or the increase in the liability of loan guarantees resulting from the modification.

127 Based on this view, the Board has concluded that, with respect to a modification of direct loans, any difference between the change in the book value of the direct loans resulting from the modification and the cost of modification should be recognized as a gain or loss in the operating statement. Similarly, any difference between the change in the amount of liability of loan guarantees resulting from the modification and the cost of modification should be recognized as a gain or loss in the operating statement. The gain or loss is to be recognized in a category distinguished from the modification expense. The modification adjustment transfer paid or received to offset the gain or loss is to be reported as a financing source or a reduction in financing source.

128 The Board further believes that agency financial statements should include a footnote to explain the calculation of the cost of modifications and nature of gain or loss on modifications.

****

APPENDIX B: TECHNICAL EXPLANATIONS AND ILLUSTRATIONS

This Appendix explains and illustrates the accounting standards for direct loans and loan guarantees. The explanations and illustrations are presented to show how the standards may be applied but are not standards themselves. They also take into account OMB and Treasury regulations on credit reform.

This Appendix has 4 parts:

-- Part I: Post-1991 Direct Loans

-- Part II: Pre-1992 Direct Loans

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

-- Part III: Post-1991 Loan Guarantees

-- Part IV: Pre-1992 Loan Guarantees

Topics covered include:

-- the measurement and recognition of direct loans, subsidy costs, and the liability of loan guarantees;

-- the reestimation and the amortization of the subsidy cost allowance;

-- the reestimation of loan guarantee liabilities and the accumulation of interest on the liabilities;

-- the recognition of revenues and expenses;

-- modifications of direct loans and loan guarantees (including the sale of direct loans);

-- the write-off of direct loans; and

-- the foreclosure of assets upon default.

The Appendix does not illustrate financial statements, journal entries, or accounting procedures. Readers should consult OMB, GAO, and Treasury for guidance.

PART I POST-1991 DIRECT LOANS

Post-1991 direct loans are direct loans obligated after September 30, 1991. The accounting for post-1991 direct loans is explained and illustrated in this part of the Appendix through an example described below:

At the end of fiscal year 1994, a federal credit program disburses a number of direct loans with a total principal of $10 million. Those loans constitute a cohort for that year. The maturity term of that cohort is 5 years and the stated annual interest rate is 4 percent.

All of the amounts used in the text below are in thousands of dollars.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

The loan contracts require an annual payment of $2,246 per year for 5 years, paid at the end of each year. In Table 1 below, the required annual payments are shown in column (a). [Footnote 15] The amounts in column (b) equal the beginning loan balance of each period multiplied by the stated interest rate of 4 percent. The amounts in column (c) are principal repayments, which equal the amounts in column (a) minus the amounts in column (b). The amounts in column (d) are the ending principal balance of each period, which equal the beginning balance minus the principal repayment of that period, shown in column (c).

[Footnote 15: The annual payment is derived by dividing the present value factor of 4.45182 into the principal of $10,000. The present value factor can be found in any ordinary annuity table, and it equals the present value of $1 paid over 5 periods discounted at 4 percent. Alternatively, knowing the loan principal, the number of pay back periods, and the interest rate, one can use computer software or a financial calculator to find the required payment per period.]

TABLE 1: PAYMENT SCHEDULE (IN THOUSANDS OF DOLLARS)

	PAYMENT (a)	INTEREST (b)	PRINCIPAL (c)	YEAR-END LOAN BALANCE (d)
FY 1994				$10,000
1995	$2,246	$400	$1,846	8,154
1996	2,246	326	1,920	6,234
1997	2,246	249	1,997	4,237
1998	2,246	169	2,077	2,160
1999	2,246	86	2,160	0

It is also assumed that:

-- The average interest rate of Treasury marketable securities of a similar maturity for the period during which the loans are disbursed is 6 percent.

-- Fees totaling $500 are received when the loans are disbursed. The fees are used to reduce the need to borrow from Treasury.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

A. REPORTING POST-1991 DIRECT LOANS AND THEIR SUBSIDY COSTS

The accounting standard for post-1991 direct loans requires that direct loans disbursed and outstanding be recognized as assets at the present value of their estimated net cash inflows. The difference between the outstanding principal of the loans and the present value of their net cash inflows is recognized as a subsidy cost allowance. [Footnote 16]

[Footnote 16: In this Appendix, the requirements of the accounting standards are summarized to address specific situations. However, the standards are not quoted verbatim. Readers should refer to the text of the standards for their exact wording.]

To implement the standard in the example, a cash flow projection and present value calculations are prepared. Based upon the risk factors and other criteria for default cost estimates that are enumerated in the accounting standards, it is estimated that losses in cash flows due to the defaults would equal 30 percent of the scheduled payments for fiscal year 1997 and each year thereafter. [Footnote 17] Table 2 below displays the cash flow projections and present value calculations.

[Footnote 17: The standard defines losses in cash flows due to default as being due to defaults net of recoveries. However, to simplify computations, recoveries are assumed to be zero throughout Parts I and II of this Appendix. References to defaults throughout Parts I and II should be understood to mean defaults net of recoveries for all cases where recoveries are expected. The accounting standard for recoveries is illustrated in Part III of this Appendix.]

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

TABLE 2:PROJECTED CASH FLOWS DISCOUNTED TO THE END OF FY 1994 (IN THOUSANDS OF DOLLARS)

	FEE COLLECTIONS	P & I PAYMENTS*	DEFAULT LOSSES	NET CASH INFLOWS
FY 1994	$500			$ 500
1995		$2,246		2,246
1996		2,246		2,246
1997		2,246	$ (674)	1,572
1998		2,246	(674)	1,572
1999		2,246	(674)	1,572
PV at 6%	$500	$9,461	$(1,603)	$8,358

*The term P & I Payments used in this table as well as other tables throughout this Appendix denotes scheduled principal and interest payments required in loan contracts.

The present value of the loans' estimated net cash inflows is $8,358. The direct loans are recognized as assets at that amount. Since the loans' outstanding principal is $10,000, the difference between the loans' outstanding principal and their present value is $1,642, which is recognized as the subsidy cost allowance.

The accounting standard for post-1991 direct loans requires that for direct loans disbursed during a fiscal year, a subsidy expense be recognized. The amount of the subsidy expense equals the present value of estimated cash outflows over the life of the loans minus the present value of estimated cash inflows, discounted at the interest rate of marketable Treasury securities with a similar maturity term, applicable to the period during which the loans are disbursed (hereinafter referred to as the applicable Treasury interest rate).

In the example, the present value of the loans' cash outflows is the disbursed amount of $10,000. The present value of the loans' estimated net cash inflows is $8,358. The difference between those two amounts is $1,642, which is recognized as subsidy expense.

The accounting standard for post-1991 direct loans requires that for the fiscal year during which new direct loans are disbursed, the components of the subsidy expense of those new direct loans be recognized separately among

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

interest subsidy costs, default costs, fees and other collections, and other subsidy costs.

The interest subsidy cost of direct loans is the excess of the amount of the loans disbursed over the present value of the interest and principal payments required by the loan contracts, discounted at the applicable Treasury interest rate (6 percent in this example). In this example, the amount of the loans disbursed is $10,000. The present value of the scheduled interest and principal payments is $9,461. The difference between those two amounts is $539, which is recognized as the interest subsidy cost.

The default cost of direct loans results from any anticipated deviation, other than prepayments, by the borrowers from the payment schedules in the loan contracts. The deviations include delinquencies and omissions in interest and principal payments. The default cost is measured at the present value of the projected payment delinquencies and omissions minus net recoveries. (See footnote 3.) In this example, the present value of the projected payment omissions minus net recoveries is $1,603, which is recognized as the default cost.

The present value of fee collections is $500, which is recognized as a deduction from subsidy costs.

There are no other subsidy costs [Footnote 18] in this example.

[Footnote 18: The term other subsidy costs is explained in the standard for subsidy costs of post-1991 direct loans and loan guarantees.]

The subsidy expense of the loans is the sum of the above cost components, which is $1,642, calculated as follows:

Interest subsidy cost	$ 539
Fee collections	(500)
Loan default cost	1,603
Total subsidy cost	$1,642

The loan disbursements are financed by three sources: subsidy payments, borrowing from Treasury, and fee

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

collections. The subsidy cost of $1,642 is provided by appropriated funds; and the present value of loans, equal to $8,358, is provided by fee collections and funds borrowed from Treasury at the Treasury interest rate of 6 percent.

The fees are collected when the loans are disbursed. Because all cash flows, including fee collections, are used to calculate the subsidy cost allowance, the amount of the fee collections is credited to the subsidy cost allowance. The collected amount reduces the amount that has to be borrowed from the Treasury. As a result, the subsidy cost allowance is $2,142, which is the sum of the interest subsidy cost of $539 and the default subsidy cost of $1,603. This is $500 more than the total subsidy cost of $1,642. The debt to Treasury is $7,858, which is $500 less than the present value of the loans of $8,358.

Table 3 displays the asset and liability balances at the end of fiscal year 1994.

TABLE 3: ASSETS AND LIABILITIES AS OF THE END OF FY 1994
(IN THOUSANDS OF DOLLARS)

ASSETS		LIABILITIES	
Loans receivable	$10,000	Debt to Treasury	$7,858
Less:			
Allowance for subsidy costs	(2,142)		
Loans receivable - net	$ 7,858		

B. SUBSIDY REESTIMATION AND AMORTIZATION

(1) SUBSIDY REESTIMATION

The accounting standard for post-1991 direct loans requires that the subsidy cost allowance for direct loans be reestimated each year as of the date of the financial statements. Since the allowance represents the present value of the net cash outflows of the underlying direct loans, the reestimation takes into account all factors that may have affected the estimate of each component of the cash flows, including prepayments, defaults, delinquencies, and recoveries. Any increase or decrease in the subsidy cost

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

allowance resulting from the reestimates is recognized as a subsidy expense (or a reduction in subsidy expense).

The standard further states that reporting the subsidy cost allowance of direct loans and reestimates by component is not required.

In Appendix A, the Basis of the Board's Conclusions, it is pointed out that the primary factor that causes changes in the subsidy cost allowance would be default reestimates. The accounting standard provides a number of risk factors and other default cost criteria to be considered in making the default cost estimates and reestimates.

In this illustration, it is originally estimated that 30 percent of the loan payments would be lost due to defaults for fiscal year 1997 and thereafter. The first reestimate is made early in fiscal year 1995. Because so little time has passed since the subsidy was initially estimated, the estimated cash flows are unchanged and the reestimate is zero. (This illustration assumes that the interest rates at the time of loan obligation and disbursement are the same, so no reestimate is needed for the difference in interest rates.)

The second reestimation is performed early in fiscal year 1996, in preparing financial statements for fiscal year 1995. It reestimates the subsidy cost allowance as of the end of fiscal year 1994. After evaluating all of the risk factors, it is concluded that defaults would occur in fiscal year 1996, instead of 1997, and that 60 percent, instead of 30 percent, of the cash flows would be lost due to the defaults in fiscal year 1996 and thereafter. Table 4 below displays the present values of the reestimated cash flows discounted to the end of fiscal year 1994.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

TABLE 4: SUBSIDY COST REESTIMATION: PROJECTED CASH FLOWS DISCOUNTED TO THE END OF FY 1994 (IN THOUSANDS OF DOLLARS)

	P & I PAYMENTS	DEFAULT LOSSES	NET CASH FLOWS
FY 1995	$2,246	$ 0	$2,246
1996	2,246	(1,348)	898
1997	2,246	(1,348)	898
1998	2,246	(1,348)	898
1999	2,246	(1,348)	898
PV at 6%	$9,461	$(4,405)	$5,056

The present value of the reestimated net cash inflows discounted to the end of fiscal year 1994 is $5,056, compared to the loans' book value of $7,858, a decrease of $2,802. Thus, the subsidy cost allowance is increased by $2,802, from $2,142 to $4,944. The amount of the increase in the subsidy cost allowance (which is the decrease in the present value of the loans), resulting from the reestimate, is recognized as subsidy expense reestimates .

A subsidy payment of $2,802, equal to the subsidy expense resulting from the reestimate, is received under permanent indefinite authority. The amount is used to repay borrowing from Treasury. Thus, the outstanding balance of the debt to Treasury is reduced by $2,802 to $5,056.

Furthermore, the direct loan program also receives a payment under permanent indefinite authority to cover the interest accrued on the reestimate subsidy payment of $2,802 for the period from the end of fiscal year 1994 to the end of fiscal year 1995. The payment is $168, which equals $2,802 times the applicable Treasury interest rate of 6 percent. This amount is recognized as interest income reestimates, and the money is used to pay the interest on the $2,802 borrowed from Treasury but repaid with the reestimate subsidy.

Table 5 displays the asset and liability balances as of the end of fiscal year 1994, adjusted for the reestimate that was calculated early in fiscal year 1996.

TABLE 5: ASSETS AND LIABILITIES AS OF THE END OF FY 1994:

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

AMOUNTS ADJUSTED FOR REESTIMATE CALCULATED IN EARLY FY 1996
(IN THOUSANDS OF DOLLARS)

ASSETS		LIABILITIES	
Loans receivable	$10,000	Debt to Treasury	$5,056
Less:			
Allowance for subsidy costs	(4,944)		
Loans receivable - net	$ 5,056		

(2) SUBSIDY AMORTIZATION

The accounting standard for post-1991 direct loans requires that the subsidy cost allowance for direct loans be amortized by the interest method using the interest rate that was originally used to calculate the present value of the direct loans when the direct loans were disbursed. The amortized amount is recognized as an increase or decrease in interest income.

The subsidy cost allowance is amortized as a whole, not by components. Under the interest method of amortization, the amortization of each period equals the effective interest of the outstanding direct loans minus the nominal interest. For any period for which interest is to be paid (a fiscal year in this example), the effective interest equals the book value (which is also the present value) of the direct loans at the beginning of the period times the applicable Treasury rate. The nominal interest equals the outstanding nominal balance of the loans at the beginning of the period times the interest rate stated in the loan contracts.

In the example, the book value of the direct loans, as reestimated, is $5,056. The effective interest for fiscal year 1995 is $303, which equals the book value of $5,056 times the applicable Treasury rate of 6 percent. The nominal interest for that year is $400, which equals the nominal principal of the direct loans $(10,000) times the stated rate of 4 percent. The amortized amount is a negative amount of $97 for fiscal year 1995, which equals the effective interest minus the nominal interest. The subsidy cost allowance is increased by $97, from $4,944 to

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

$5,041. The amortized amount is recognized as a reduction in interest income. (Interest income for fiscal year 1995 is calculated in section C: Revenues and Expenses.) [Footnote 19]

[Footnote 19: Amortization can alternatively be computed as interest expense other than reestimates $(471) minus the sum of interest income from borrowers $(400), interest income from reestimates $(168), and interest income on fund balance with Treasury $(0). These figures are derived in section C below.]

The same procedure of amortization is applied for each of the subsequent years so long as the direct loans are outstanding. The collection of interest and principal payments must be properly accounted for together with the amortization, so that the asset and liability balances can be updated.

At the end of fiscal year 1995, payments of $2,246 are received from the borrowers as scheduled. Of this amount, $400 is interest payments, and the remaining amount of $1,846 is principal repayments. Thus, the outstanding nominal balance of the loans is reduced by $1,846 to $8,154.

The $2,246 received from the borrowers was paid to Treasury. Although the debt to Treasury outstanding at the end of fiscal year 1994 was $7,858, the amount of $2,802 has been paid off by the subsidy payment for the reestimate. This left $5,056 of debt to Treasury. The interest that accrued on this remaining debt to Treasury is $303; the interest that accrued on the amount of debt paid off by the subsidy reestimate is $168, but it is covered by the interest on the reestimate. Therefore, of the $2,246 collected from the borrowers, $303 is interest paid to Treasury. The remaining $1,943 is principal repayment to Treasury. After the principal repayment, the outstanding debt to Treasury becomes $3,113.

Table 6 below displays the asset and liability balances after the amortization and the collection of interest and principal payments at the end of fiscal year 1995.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

TABLE 6: ASSETS AND LIABILITIES AFTER AMORTIZATION AT THE END OF FY 1995 (IN THOUSANDS OF DOLLARS)

ASSETS		LIABILITIES	
Loans receivable	$8,154	Debt to Treasury	$3,113
Less:			
Allowance for subsidy costs	(5,041)		
Loans receivable - net	$ 3,113		

C. REVENUES AND EXPENSES

The accounting standard for post-1991 direct loans requires that interest accrued on direct loans, including amortized interest, be recognized as interest income. Interest accrued on debt to Treasury is recognized as interest expense.

In this example, interest income for fiscal year 1995 is $471, which consists of the following items:

Nominal interest	$ 400
Amortized interest	(97)
Interest reestimates	168
Total interest income	$ 471

Interest expense on the debt to Treasury for the fiscal year is also $471, which equals the debt to Treasury of $7,859 at the beginning of the year times 6 percent. It is financed with the following sources:

Collections from borrowers	$303
Interest on reestimated subsidy payments	168
Total interest expense	$471

Costs of administering credit activities, such as salaries, legal fees, and office costs, that are incurred for credit policy evaluation, loan origination, closing, servicing, monitoring, maintaining accounting and computer systems, and other credit administrative purposes, are recognized separately as administrative expenses. Administrative expenses are not included in calculating the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

subsidy costs of direct loans.

D. MODIFICATION OF POST-1991 DIRECT LOANS

The accounting standard on modifications states that the term modification means a federal government action, including new legislation or administrative action, that directly or indirectly alters the estimated subsidy cost and the present value of outstanding direct loans.

Readers should refer to the text of the standard and to Appendix A, Basis of the Board's Conclusions, for a more detailed definition of modifications.

Assume that in October 1995, shortly after the close of fiscal year 1995, Congress passed legislation to aid the borrowers. The legislation forgave some of the outstanding loans, and extended the maturity of the remaining loans for one additional year (to the end of fiscal year 2000). It is estimated that 70 percent of the outstanding amounts, or $5,708, is forgiven.

The legislative action is within the definition of direct modification because it is a federal government action that directly changes the estimated subsidy cost and the present value of outstanding direct loans by altering the terms of existing contracts.

The accounting standard on modifications states that with respect to a direct or indirect modification of pre-1992 or post-1991 direct loans, the cost of modification is the excess of the pre-modification value of the loans over their post-modification value. The amount of the modification cost is recognized as a modification expense when the loans are modified.

The accounting is implemented in the steps described below.

(1) CALCULATE THE PRE-MODIFICATION VALUE

The pre-modification value is the present value of the net cash inflows of the direct loans estimated at the time of modification under pre-modification terms and discounted at the current discount rate.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

As used in this part and Part II of this Appendix, the current discount rate is the interest rate applicable at the time of modification on marketable Treasury securities with a similar maturity to the remaining maturity of the direct loans under pre-modification terms or post-modification terms, whichever is appropriate. [Footnote 20]

[Footnote 20: The definition of the current discount rate is provided in Appendix C, Glossary.]

The cash flows of the loans under pre-modification terms during 1996-99 are assumed to be the same as the cash flows that were reestimated early in fiscal year 1996 for these years and that are shown in Table 4. Those cash flows are used to calculate the loans' pre-modification value. It is assumed that the Treasury rate for a comparable maturity (4 years) and applicable to the time of modification is 4.5 percent. As Table 7 below shows, the present value of the pre-modification cash flows discounted at 4.5 percent is $3,223.

TABLE 7: PRE-MODIFICATION VALUE (IN THOUSANDS OF DOLLARS, CALCULATED AT THE CURRENT DISCOUNT RATE)

	P & I PAYMENTS	DEFAULT LOSSES	NET CASH FLOWS
FY 1996	$2,246	$(1,348)	$ 898
1997	2,246	(1,348)	898
1998	2,246	(1,348)	898
1999	2,246	(1,348)	898
PV at 4.5%	$8,058	$(4,835)	$3,223

(2) CALCULATE THE POST-MODIFICATION VALUE

The loans' post-modification value is the present value of the loans' net cash inflows estimated at the time of modification under post-modification terms and discounted at the current discount rate (for a 5-year maturity).

The modification forgives 70 percent of the outstanding principal amounts, and requires the remaining 30 percent, or

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

$2,446, be paid back in 5 years (instead of 4 years) starting with year 1996. The stated interest rate remains at 4 percent. As shown in Table 8 below, under the modified terms, the required annual principal and interest payment is $549.

TABLE 8: PAYMENT SCHEDULE OF THE MODIFIED LOANS (IN THOUSANDS OF DOLLARS)

	PAYMENT	YEAR-END INTEREST	PRINCIPAL	LOAN BALANCE
FY 1995				$ 2,446
1996	$549	$97	$452	1,994
1997	549	79	470	1,524
1998	549	61	488	1,036
1999	549	41	508	528
2000	549	21	528	0

It is estimated that 20 percent of the scheduled cash inflows of the modified loans would be lost due to defaults. The current discount rate for a maturity of 5 years is 5 percent. As Table 9 shows, the present value of the post-modification cash inflows discounted at 5 percent is $1,902.

TABLE 9: POST-MODIFICATION VALUE (IN THOUSANDS OF DOLLARS, CALCULATED AT THE CURRENT DISCOUNT RATE)

	P & I PAYMENTS	DEFAULT LOSSES	NET CASH FLOWS
FY 1996	$549	$(110)	$ 439
1997	549	(110)	439
1998	549	(110)	439
1999	549	(110)	439
2000	549	(110)	439
PV at 5%	$2,377	$(475)	$1,902

(3) CALCULATE AND RECOGNIZE THE COST OF MODIFICATION

The cost of modification is the excess of the pre-modification value over the post-modification value.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

Since the pre-modification value is $3,223, and the post-modification value is $1,902, the cost of modification is $1,321, which is recognized as a subsidy expense for modifications.

(4) CALCULATE THE CHANGE IN THE LOANS' BOOK VALUE

The accounting standard on direct loan modifications requires that when post-1991 direct loans are modified, their existing book value be changed to an amount equal to the present value of the loans' net cash inflows projected under the modified terms from the time of modification to the loans' maturity and discounted at the original discount rate (the rate that is originally used to calculated the present value of the direct loans, when the direct loans were disbursed).

In this example, the original discount rate is 6 percent. As Table 10 below shows, the present value of the net cash inflows estimated under the modified terms and discounted at 6 percent is $1,849.

TABLE 10: POST-MODIFICATION BOOK VALUE (IN THOUSANDS OF DOLLARS, CALCULATED AT THE ORIGINAL DISCOUNT RATE)

	P & I PAYMENTS	DEFAULT LOSSES	NET CASH FLOWS
FY 1996	$549	$(110)	$ 439
1997	549	(110)	439
1998	549	(110)	439
1999	549	(110)	439
2000	549	(110)	439
PV at 6%	$2,312	$(463)	$1,849

At the time the modification action is taken, the existing book value of the loans is $3,113. The book value is changed to $1,849. This represents a decrease in book value by $1,264.

Table 11 displays the effect of the modification on the book amounts. The table shows that, due to the forgiveness, (1) the outstanding balance of the loans receivable is reduced from $8,154 to $2,446, (2) the book value is reduced

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

from $3,113 to $1,849, and (3) the subsidy cost allowance, which is the difference between the gross amount and the book value, is changed from $5,041 to $597.

TABLE 11: CHANGE IN THE VALUE OF MODIFIED LOANS (IN THOUSANDS OF DOLLARS)

	GROSS AMOUNT	ALLOWANCE	BOOK VALUE
Before Modification	$8,154	$(5,041)	$3,113
After Modification	$2,446	$(597)	$1,849

(5) CALCULATE THE GAIN OR LOSS AND THE DEBT TO TREASURY

The accounting standard on direct loan modifications states that the change in book value of both pre-1992 and post-1991 direct loans resulting from a direct or indirect modification and the cost of modification will normally differ, due to the use of different discount rates or the use of different measurement methods. Any difference between the change in book value and the cost of modification is recognized as a gain or loss. For post-1991 direct loans, the modification adjustment transfer [Footnote 21] paid or received to offset the gain or loss is recognized as a financing source (or a reduction in financing source).

[Footnote 21: OMB instructions provide that if the decrease in book value exceeds the cost of modification, the reporting entity receives from the Treasury an amount of modification adjustment transfer equal to the excess; and if the cost of modification exceeds the decrease in book value, the reporting entity pays to Treasury an amount of modification adjustment transfer to offset the excess. (See OMB Circular A-11.)]

The change in book value in this case is $1,264, compared to the cost of modification of $1,321. The amount of the modification cost exceeds the change in book value by $57. This excess is recognized as a gain.

The credit program receives a subsidy appropriation

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

equal to the cost of modification. Since the cost of modification exceeds the decrease in book value by $57, the credit program pays to the Treasury a modification adjustment transfer of $57 to offset the excess. This is reported as a reduction in financing source.

The $1,321 subsidy appropriation received minus the $57 modification adjustment transfer paid is used to repay debt to Treasury. As a result, the debt to Treasury is reduced by $1,264 from $3,113 to $1,849.

Table 12 displays the asset and liability balances after the modification in October 1995.

TABLE 12: ASSETS AND LIABILITIES AFTER MODIFICATION IN OCTOBER 1995 (IN THOUSANDS OF DOLLARS)

ASSETS		LIABILITIES	
Loans receivable	$2,446	Debt to Treasury	$1,849
Less:			
Allowance for subsidy costs	(597)		
Loans receivable - net	$ 1,849		

(6) PROVIDE DISCLOSURES

The accounting standard requires that disclosure be made in notes to financial statements to explain the nature of the modification of direct loans, the discount rate used in calculating the modification expense, and the basis for recognizing a gain or loss related to the modification.

With respect to the modification described above, a footnote disclosure should be made in the financial statements for fiscal year 1996. The disclosure would explain the following: [Footnote 22]

[Footnote 22: The disclosure will not be illustrated for other modifications explained in this Appendix.]

(a) The direct loans in the cohort of fiscal year 1994 were modified in October 1995. The modification was to forgive 70 percent of the outstanding loans and to extend

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

the maturity of the remaining loans to the end of fiscal year 2000.

(b) The modification expense is $1,321, which is the decrease in the present value of the cash flows from that estimated under pre-modification terms to that estimated under post-modification terms, discounted at the current interest rate of marketable Treasury securities of similar maturity. The pre-modification cash flows were discounted at the current discount rate of 4.5 percent, which was applicable to a maturity of 4 years, and the post-modification cash flows were discounted at the current discount rate of 5 percent, which was applicable to a maturity of 5 years.

(c) As a result of the modification, the book value of the loans receivable decreased by $1,264, from $3,113, as reported at the end of fiscal year 1995, to $1,849. The difference between this decrease in book value and the modification expense, which amounts to $57, is recognized as a gain in the operating statement.

E. Write-off of Direct Loans

The accounting standard on write-off of direct loans requires that when post-1991 direct loans are written off, the unpaid principal of the loans be removed from the gross amount of loans receivable. Concurrently, the same amount is charged to the allowance for subsidy costs. Prior to the write-off, the uncollectible amounts should have been fully provided for in the subsidy cost allowance through the subsidy cost estimate or reestimates. Therefore, the write-off would have no effect on expenses.

Direct loans in this example that are determined to be uncollectible are written off as of the end of fiscal year 1996. However, before the write-off, accounting is performed for the year-end reestimation, the amortization of the allowance for subsidy costs, and the recording of collections and payments. This takes the following steps:

(1) THE REESTIMATION OF THE SUBSIDY COST ALLOWANCE

In early fiscal year 1997, before the write-off, the credit program makes a year-end reestimation for the subsidy cost allowance. This reestimation is for the balances

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

calculated as of the end of fiscal year 1995 adjusted for the modification in October 1995 (Table 12). The result of the reestimation indicates that 20 percent of the outstanding loan payments due after the modification were lost because of defaults for fiscal year 1996, and the expected loss would be 30 percent in fiscal year 1997 and thereafter. The reestimated loss of 30 percent for fiscal year 1997 and the subsequent years is 10 percentage points more than the previous estimate made in October 1995, when the loans were modified. As Table 13 below shows, the net present value of the reestimated net cash inflows, discounted at the original rate of 6 percent to the end of fiscal year 1995, is $1,670.

TABLE 13: SUBSIDY COST REESTIMATION: PROJECTED CASH FLOWS DISCOUNTED TO THE END OF FY 1995 (IN THOUSANDS OF DOLLARS)

	P & I PAYMENTS	DEFAULT LOSSES	NET CASH FLOWS
FY 1996	$549	$(110)	$ 439
1997	549	(165)	384
1998	549	(165)	384
1999	549	(165)	384
2000	549	(165)	384
PV at 6%	$2,313	$(643)	$1,670

Based on the reestimate, the direct loans' book value is reduced by $179, from $1,849 to the reestimated present value of $1,670. This is accomplished by adjusting the subsidy cost allowance upward by $179, from $597 to $776. The increase of $179 in the subsidy cost allowance is recognized as subsidy expense reestimates.

A subsidy payment of $179 equal to the subsidy cost increase resulting from the reestimate is received under permanent indefinite authority and is used to reduce debt to Treasury. As a result, the debt to Treasury is reduced from $1,849 to $1,670.

Furthermore, the direct loan program also receives a payment under permanent indefinite authority to cover the interest accrued on the increased subsidy expense of $179. The payment is $11, which equals $179 times the applicable Treasury interest rate of 6 percent. This amount is

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

recognized as interest income reestimates, and the money is used to pay interest accrued for fiscal year 1996 on the $179 borrowed from Treasury, that is repaid by the subsidy reestimate.

The following table displays the asset and liability balances as of the end of fiscal year 1995, adjusted for the modification in October 1995 and the results of the reestimate that is calculated in early fiscal year 1997.

TABLE 14: ASSETS AND LIABILITIES AS OF THE END OF FY 1995: AMOUNTS ADJUSTED FOR MODIFICATION IN OCTOBER 1995 AND REESTIMATES CALCULATED IN EARLY FY 1997 (IN THOUSANDS OF DOLLARS)

ASSETS		LIABILITIES	
Loans receivable	$2,446	Debt to Treasury	$1,670
Less:			
Allowance for subsidy costs	(776)		
Loans receivable - net	$ 1,670		

(2) THE AMORTIZATION OF THE SUBSIDY COST ALLOWANCE

The subsidy cost allowance is amortized as of the end of fiscal year 1996. The amortized amount equals the loans' effective interest minus their nominal interest. The loans' effective interest for fiscal year 1996 is $100, which is the loan's book value of $1,670, as reestimated, times the original discount rate of 6 percent. The loans' nominal interest is $98, which is the loans' nominal outstanding balance of $2,446 times the stated interest rate of 4 percent. Thus, the amortized amount is $2, which is the effective interest minus the nominal interest. The amortized amount is recognized as interest income, and the allowance for subsidy costs is reduced by $2, and becomes $774.

(3) COLLECTIONS AND PAYMENTS

Of the scheduled annual payment of $549 for fiscal year 1996, payments of $439 are received from the borrowers, which equal 80 percent of the scheduled payments. Of the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

amount received, $78 is interest payment (which equals 80 percent of the loans' balance of $2,446 times the stated interest rate of 4 percent), and the remaining $361 is principal repayment. The outstanding nominal principal of the loans is reduced by $361 to $2,085. There is unpaid accrued interest of $20 (which equals 20 percent of the loans' nominal balance as of the end of fiscal year 1995 times the stated interest rate of 4 percent). At this point of time, the loans' book value is $1,331, which equals the outstanding principal of $2,085, plus interest receivable of $20, minus the subsidy cost allowance of $774.

The debt to Treasury was $1,849 after the modification in October 1995. Of that amount, $179 has been paid off with the subsidy payment received as a result of the reestimate, which reduces the debt to $1,670; and the $11 of accrued interest on the $179 has been paid off with the interest on the reestimate. The interest accrued on the remaining debt is $100, which equals the debt balance of $1,670 times the Treasury interest rate of 6 percent. Of the $439 in payments received from the borrowers, $100 is used to pay interest due Treasury, and the remaining $339 is used to reduce debt to Treasury. As a result, the balance of debt to Treasury becomes $1,331.

Table 15 displays the asset and liability balances after the amortization and the recording of collections and payments at the end of fiscal year 1996.

TABLE 15: ASSETS AND LIABILITIES AFTER AMORTIZATION AT THE END OF FY 1996 (IN THOUSANDS OF DOLLARS

ASSETS		LIABILITIES	
Loans receivable	$2,085	Debt to Treasury	$1,331
Interest receivable	20		
Less:			
Allowance for subsidy costs	(774)		
Loans and interest receivable - net	$1,331		

(4) WRITE-OFF OF UNCOLLECTIBLE DIRECT LOANS

It is confirmed that non-performing loans with an

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

outstanding balance of $489 (20 percent of the direct loan balance after modification in October 1995) are in default and will not be collected. The credit program is authorized to write off those loans, and the unpaid accrued interest of $20. The total amount of the write-off is $509. Thus, the principal is reduced by $489 to $1,596, and the interest receivable of $20 is written off. The subsidy cost allowance is reduced by $509, from $774 to $265.

The loans' book value is not changed by the write-off; it remains $1,331, which equals the remaining principal of $1,596, minus the subsidy allowance of $265. Table 16 below shows the asset and liability balances after the write-off.

TABLE 16: ASSETS AND LIABILITIES AFTER THE WRITE-OFF AS OF THE END OF FY 1996 (IN THOUSANDS OF DOLLARS)

ASSETS		LIABILITIES	
Loans receivable	$1,596	Debt to Treasury	$1,331
Less:			
Allowance for subsidy costs	(265		
Loans receivable - net	$ 1,331		

The book value of $1,331, as indicated in the above table, equals the present value of estimated net cash inflows of the remaining outstanding loans. The estimated cash flows and the present value calculations are shown in Table 17.

In Table 17 the amounts in column (a) are the scheduled annual principal and interest payments. Since the principal of the outstanding loans is $1,596 and the remaining life of the loans is 4 years, the required annual payment is $439. The amounts in column (b) equal the default amounts reestimated at the end of fiscal year 1996 minus the scheduled payments of the loans that have been written off (recoveries on those loans are assumed to be zero). The amounts in column (c) are the projected net cash inflows of the outstanding loans.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

TABLE 17: PROJECTED CASH FLOWS AFTER LOAN WRITE-OFF: DISCOUNTED TO THE END OF FY 1996 (IN THOUSANDS OF DOLLARS)

	P & I Payments (a)	Default Losses (b)	Net Cash Flows (c)
FY 1997	$439	$(55)	$384
1998	439	(55)	384
1999	439	(55)	384
2000	439	(55)	384
PV at 6%	$1,521	$(190)	$1,331

It should be noted that to calculate the amortization correctly in subsequent periods, the unpaid principal and interest should be written out of the nominal principal balance. The amortization would be distorted if the unpaid amounts were kept in the nominal principal balance and continued to accrue interest. However, direct loan programs may need to keep the non-paying loans in their accounting records until collection efforts are exhausted and the loans are authorized to be written off. The non-paying loans and interest accrued on them should be accounted for separately, so that the amortization of the subsidy cost allowance of the performing loans can be calculated correctly. Readers should consult Treasury, OMB, or GAO, for guidance on accounting for non-paying loans.

F. SALE OF DIRECT LOANS

The accounting standard on sale of loans states that the sale of post-1991 and pre-1992 direct loans is a direct modification. [Footnote 23]

[Footnote 23: This assumes that the sales proceeds were not included in the cash flow estimates for the initial subsidy calculation.]

It is assumed that after the close of fiscal year 1996, the credit program is authorized to sell the loans. In October 1996, all of the loans are sold with recourse. The net proceeds from the sale amount to $1,100. Accounting for the sales takes the steps explained in the paragraphs that follow.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

(1) RECOGNIZE THE COST OF MODIFICATION

The accounting standard on sale of loans requires that the cost of modification be determined on the basis of the pre-modification value of the loans sold. If the pre-modification value of the loans sold exceeds the net proceeds from the sale, the excess is the cost of modification, which is recognized as modification expense.

The pre-modification value of the loans sold is the present value of the loans' net cash inflows estimated under pre-modification terms and discounted at the current discount rate.

The net cash inflows of the direct loans estimated prior to the sale are assumed to be the same as those estimated after the loan write-off at the end of fiscal year 1996 (shown in Table 17). It is assumed that the current discount rate for a similar maturity (4 years) is 5 percent. To calculate the pre-modification value, the net cash flows are now discounted at the current discount rate of 5 percent. As Table 18 shows, the pre-modification value of the loans sold is $1,362.

TABLE 18: PRE-MODIFICATION VALUE OF THE LOANS SOLD, AS OF OCTOBER 1996 (IN THOUSANDS OF DOLLARS, CALCULATED AT THE CURRENT DISCOUNT RATE)

	P&I PAYMENTS	DEFAULT LOSSES	NET CASH FLOWS
FY 1997	$ 439	$ (55)	$ 384
1998	439	(55)	384
1999	439	(55)	384
2000	439	(55)	384
PV at 5%	$1,557	$(195)	$1,362

The pre-modification value of the loans sold exceeds the net proceeds of $1,100 from the sale by $262, which is recognized as a modification expense. The credit program receives an appropriation equal to that amount to cover the modification cost. (The credit program must have an appropriation equal to the modification cost before it can sell the loans.)

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

(2) RECOGNIZE BOOK VALUE GAIN OR LOSS

The accounting standard on sale of direct loans states that the book value loss (or gain) on a sale of direct loans equals the existing book value of the loans sold minus the net proceeds from the sale. Since the book value loss (or gain) and the cost of modification are calculated on different bases, they will normally differ. Any difference between the book value loss (or gain) and the cost of modification is recognized as a gain or loss. [Footnote 24] For sales of post-1991 direct loans, the modification adjustment transfer paid or received to offset the gain or loss is recognized as a financing source (or a reduction in financing source).

[Footnote 24: If there is a book value gain, the gain to be recognized equals the book value gain plus the cost of modification.]

The existing book value of the loans sold is $1,331. Upon the sale, this amount is removed from the books. At the same time, the net proceeds of $1,100 from the sale are recorded. The book value loss is $231. The accounting standard requires that any difference between the book value loss and the cost of modification be recognized as a gain or loss. In this case, the cost of modification is $262 and the book value loss is $231. The difference of $31 is recognized as a gain. Under the OMB instructions, this amount will be paid to Treasury as a modification adjustment transfer, and is recorded as a reduction in financing sources.

(3) RECOGNIZE THE SUBSIDY EXPENSE ON RECOURSE

The accounting standard on sale of loans requires that for a loan sale with recourse, potential losses under the recourse or guarantee obligations be estimated, and that the present value of the estimated losses from the recourse be recognized as subsidy expense when the sale is made and as a loan guarantee liability.

It is estimated that 10 percent of the loans sold with a principal of $160 would default at the end of fiscal year 1997. Upon their default, the federal credit program will

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

pay the loan purchaser an amount equal to the defaulted principal plus accrued interest. The estimated future default payment is $166, which equals the principal of the loans that are expected to default plus the 4 percent nominal interest of $6 accrued on those loans for one year.

At the time the loans are sold, the interest rate of Treasury securities of a similar maturity is 5 percent. The present value of the estimated default payment discounted at 5 percent is $158. This amount is recognized as a subsidy expense and a loan guarantee liability. The credit program receives an appropriation of $158 to cover the guarantee expense, which is paid to the loan guarantee financing account and becomes part of the fund balance of that account. (An appropriation must be available to cover the subsidy expense before the loans can be sold, since the payment to the loan guarantee financing account must be made in order for the guarantee to take effect.)

At this point, the credit program has $1,489 in cash, which was derived from the following events:

Net proceeds from the loan sale	$1,100
Appropriation to cover the modification cost	262
Appropriation to cover estimated recourse liability	158
Less: modification adjustment transfer	(31)
Total in fund balance	$1,489

The credit program uses $1,331 to pay off the debt to Treasury, which was borrowed to finance the direct loans. The remaining balance of $158 has been paid to the loan guarantee financing account (as stated above). That amount, together with interest for one year at 5 percent, is to cover the recourse liability of the loan guarantee financing account.

PART II PRE-1992 DIRECT LOANS

Pre-1992 direct loans are direct loans obligated prior to October 1, 1991, and are recorded in liquidating accounts. The accounting standard requires that the losses of pre-1992 direct loans be recognized when it is more likely than not that the direct loans will not be totally

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

collected. The allowance of the uncollectible amounts should be reestimated each year as of the date of the financial statements. In estimating losses, the risk factors discussed in the standard for post-1991 direct loans should be considered.

The standard further states that restatement of pre-1992 direct loans on a present value basis is permitted but not required.

All of the amounts used in the text that follows are in thousands of dollars.

A. PROVISION FOR UNCOLLECTIBLE AMOUNTS

Assume that at the end of fiscal year 1994 a credit program has pre-1992 direct loans with outstanding principal of $5,000 at 7 percent interest rate, maturing in three years (at the end of fiscal year 1997). The program management evaluates the risk factors enumerated in the accounting standard, and estimates that the net loss of principal due to defaults would be $2,000. Thus, the program management provides an allowance of $2,000 for uncollectible amounts, and charges that amount to bad debt expense. [Footnote 25] Thus, the book value of the loans is $3,000, as shown below:

[Footnote 25: This assumes that no allowance for uncollectible amounts was provided prior to fiscal year 1994. If there is an allowance for uncollectible amounts, that allowance should be adjusted to the current estimate and the difference between the current estimate and the existing allowance should be charged to bad debt expense.]

Loans receivable	$5,000
Less uncollectible amounts	(2,000)
Loan receivable, net	$3,000

B. MODIFICATION OF PRE-1992 DIRECT LOANS

Assume that in October 1994, shortly after the close of fiscal year 1994, a decision is made to take the following actions: (1) forgive 50 percent of the amounts due, (2) lower the interest rate to 4 percent, and (3) extend the due date to the end of fiscal year 2000.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

These actions are within the definition of direct modification because they are federal government actions that would directly change estimated subsidy costs and the present value of outstanding direct loans by altering the terms of existing contracts.

The accounting standard on direct loan modifications states that with respect to a direct or indirect modification of pre-1992 direct loans, the cost of modification is the excess of the pre-modification value of the loans over their post-modification value. The amount of the modification cost is recognized as a modification expense when the loans are modified.

Accounting for the cost of modification takes the following steps:

(1) CALCULATE THE PRE-MODIFICATION VALUE

The pre-modification value is the present value of the net cash inflows of the direct loans estimated at the time of modification under pre-modification terms and discounted at the current discount rate.

It is estimated that under the pre-modification terms, 40 percent of the cash flows would be lost due to defaults in fiscal year 1995 and each year thereafter. The current discount rate for a maturity of 3 years is 4 percent. As Table 19 below shows, the present value of the estimated net cash inflows discounted at 4 percent is $3,172. This is the pre-modification value of the loans.

TABLE 19: PRE-MODIFICATION VALUE (IN THOUSANDS OF DOLLARS, CALCULATED AT THE CURRENT DISCOUNT RATE)

	P & I PAYMENTS	DEFAUL LOSSES	NET CASH FLOWS
FY 1995	$1,905	$(762)	$1,143
1996	1,905	(762)	1,143
1997	1,905	(762)	1,143
PV at 4%	$5,287	$(2,115)	$3,172

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

(2) CALCULATE THE POST-MODIFICATION VALUE

The loans' post-modification value is the present value of the loans' net cash inflows estimated at the time of modification under post-modification terms and discounted at the current discount rate.

The modification reduces the outstanding principal by 50 percent to $2,500, lowers the nominal interest rate to 4 percent, and extends the maturity by 3 years to the end of fiscal year 2000. As shown in Table 20 below, under the post-modification terms, the required payments will be $477 per year for six years.

TABLE 20: PAYMENT SCHEDULE OF THE MODIFIED LOANS (IN THOUSANDS OF DOLLARS)

	PAYMENT	INTEREST	PRINCIPAL	YEAR-END LOAN BALANCE
FY 1994				$2,500
1995	$477	$100	$377	2,123
1996	477	85	392	1,731
1997	477	69	408	1,323
1998	477	53	424	899
1999	477	36	441	458
2000	477	19	458	0

Taking into consideration that the loans owed by borrowers with poor conditions have been forgiven, it is estimated that only 10 percent of the cash flows would be lost due to defaults. The current discount rate for a maturity of 6 years is 5 percent. As shown in Table 21, the present value of the estimated net cash inflows discounted at 5 percent is $2,179. This is the loans' post-modification value.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

TABLE 21: POST-MODIFICATION VALUE (IN THOUSANDS OF DOLLARS, CALCULATED AT THE CURRENT DISCOUNT RATE)

	P & I PAYMENTS	DEFAULT LOSSES	NET CASH FLOWS
FY 1995	$477	$(48)	$ 429
1996	477	(48)	429
1997	477	(48)	429
1998	477	(48)	429
1999	477	(48)	429
2000	477	(48)	429
PV at 5%	$2,421	$(242)	$2,179

(3) CALCULATE AND RECOGNIZE THE COST OF MODIFICATION

The cost of modification is the excess of the loans' pre-modification value over the loans' post-modification value. Since the loans' pre-modification value is $3,172, and their post-modification value is $2,179, the cost of modification is $993, which is recognized as a subsidy expense for modifications.

The credit program receives an appropriation of $993 to cover the modification expense, which is paid to the financing account. The financing account, in turn, pays this amount to the liquidating account as part of its payment to acquire the loans. (A subsidy appropriation equal to the cost of modification must be available before the modification can take place.)

(4) CALCULATE THE CHANGE IN BOOK VALUE AND THE GAIN OR LOSS

With respect to modifications of pre-1992 direct loans, the standard requires that when pre-1992 direct loans are directly modified, they be transferred to a financing account and their book value be changed to an amount equal to their post-modification value. Any subsequent modification is treated as a modification of post-1991 loans.[Footnote 26]

[Footnote 26: The accounting standard provides that when pre-1992 direct loans are indirectly modified, they are kept in a liquidating account; and that their bad debt allowance is reassessed and adjusted to

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

reflect amounts that would not be collected due to the modification. Indirect modifications of pre-1992 direct loans are not illustrated.]

The change in book value of pre-1992 direct loans resulting from a direct or indirect modification and the cost of modification will normally differ, due to the use of different discount rates or the use of different measurement methods. Any difference between the cost of modification and the change in the loans' book value due to modification is recognized as a gain or loss.

Prior to the modification, the book value of the loans was recorded in the liquidating account at $3,000. Upon modification, the loans are transferred from the liquidating account to the financing account and recorded at their post-modification value of $2,179. The change in book value is a decrease of $821. Since the cost of modification is $993, and the change in book value is $821, the difference of $172 is recognized as a gain.

The financing account pays the liquidating account an amount equal to the loans' pre-modification value of $3,172. This comes from two sources. First, the financing account receives the $993 that is appropriated for the cost of modification. Second, the financing account borrows from Treasury the remainder, which is $2,179, the post-modification value of the loans. In exchange, the liquidating account transfers to the financing account the loan assets that had a book value of $3,000 before the modification was made. The gain to the liquidating account is $172, which, as shown above, equals the difference between the cost of modification and the change in book value of the loans.

Post-1991 loan guarantees are loan guarantees committed after September 30, 1991. The accounting standards for post-1991 loan guarantees are explained and illustrated through the use of an example described below:

A cohort of 5-year term loans that amounts to $10 million in face value is guaranteed by a federal loan guarantee program. The guarantee covers 60 percent of the principal and interest payments. The borrowers are required to pay interest annually at 7 percent, and to repay the principal when the loans mature at the end of the 5th year.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

The government agrees to pay a 1 percent interest supplement to the lenders at the end of each year over the loans' life. The loans are disbursed on September 30, 1994. The federal loan guarantee program collects a fee of 5 percent, when the loans are disbursed. The average interest rate of marketable Treasury securities of a similar maturity for the period in which the guaranteed loans are disbursed is 6 percent.

All of the amounts used in the text that follows are in thousands of dollars.

A. REPORTING THE LIABILITY OF POST-1991 LOAN GUARANTEES AND THEIR SUBSIDY COSTS

The accounting standard for post-1991 loan guarantees requires that for guaranteed loans outstanding, the present value of estimated net cash outflows of the loan guarantees be recognized as a liability. Disclosure is made of the face value of the guaranteed loans outstanding and the amount of the outstanding balance that is guaranteed.

To implement the standard in the example, cash flow estimates and present value calculations are prepared. It is projected that the borrowers would pay interest when due, but would default on 60 percent, or $6,000, of the principal repayments. Upon default, the federal credit program will pay 60 percent of the defaulted principal, equal to $3,600, to the lenders. It is projected that a net recovery of $2,000 will be realized a year later through the foreclosure and sale of pledged assets. The fees of $500 are received when the guaranteed loans are disbursed.

Table 22 below shows the estimated cash flows and the present values of the cash flows.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

TABLE 22: PROJECTED CASH FLOWS DISCOUNTED TO THE TIME OF DISBURSEMENT (IN THOUSANDS OF DOLLARS)

	FEE RECEIPTS	INTEREST SUPPLE-MENTS	DEFAULT PAYMENTS	NET RECOV-ERIES	NET CASH FLOWS
FY1994	$(500)				$(500)
1995		$100			100
1996		100			100
1997		100			100
1998		100			100
1999		100	$3,600		3,700
2000				$(2,000)	(2,000)
PV at 6%	$(500)	$421	$2,690	$(1,410)	$1,201

The present value of the estimated net cash outflows of the loan guarantees is $1,201. This amount is recognized as a liability.

Disclosure is made in a footnote to the financial statements for fiscal year 1994 that guaranteed loans have an outstanding principal of $10,000, and the guaranteed amount is $6,000. (A similar disclosure is made in each year so long as the guaranteed loans are outstanding.)

The accounting standard for post-1991 loan guarantees requires that for guaranteed loans disbursed during a fiscal year, a subsidy expense be recognized. The amount of the subsidy expense equals the present value of estimated cash outflows over the life of the guaranteed loans minus the present value of estimated cash inflows, discounted at the interest rate of marketable Treasury securities with a similar maturity term, applicable to the period during which the loans are disbursed (hereinafter referred to as the applicable Treasury interest rate).

In the example, the present value of the cash outflows minus the present value of the cash inflows is $1,201, which is recognized as a subsidy expense.

The accounting standard for post-1991 loan guarantees requires that for the fiscal year during which new guaranteed loans are disbursed, the components of the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

subsidy expense of those new loan guarantees be recognized separately among interest subsidy costs, default costs, fees and other collections, and other subsidy costs.

The interest subsidy cost of the loan guarantees is the present value of the interest supplement payments to the lenders, which, in this example, is $421.

The default cost is the present value of the projected default payments minus the present value of net recoveries. The present value of the default payments is $2,690, and the present value of the net recoveries is $1,410. Thus, the default cost is $1,280.

The present value of fee collections, which is $500, is recognized as a deduction from subsidy costs.

There are no other subsidy costs in this example.

The subsidy expense of the loan guarantees is the sum of the above cost components, which is $1,201, calculated as follows:

Interest subsidy cost	$ 421
Fee collections	(500)
Loan default cost	1,280
Total subsidy cost	$1,201

The loan guarantee program receives an appropriation equal to the subsidy cost of $1,201. When the guaranteed loans are disbursed, the appropriated amount is paid to the loan guarantee financing account and is recorded in fund balance with Treasury. The $500 of fees are collected at the same time. The amount of the fees is debited to fund balance with Treasury and credited to the liability of the loan guarantees. Thus, the fund balance is raised to $1,701, on which Treasury pays 6 percent interest. The loan guarantee liability is also raised from $1,201 to $1,701.

Table 23 shows the projected cash flows and their present values after the receipt of fees.

TABLE 23: PROJECTED CASH FLOWS DISCOUNTED TO THE END OF FY 1994, AFTER THE RECEIPT OF FEES
(IN THOUSANDS OF DOLLARS)

ASSETS		LIABILITIES	
Fund balance with Treasury	$1,701	Loan guarantee liability	$1,701

B. LIABILITY REESTIMATION AND INTEREST COMPOUNDING

(1) THE REESTIMATION OF THE LIABILITY OF LOAN GUARANTEES

The accounting standard for post-1991 loan guarantees requires that the liability for loan guarantees be reestimated each year as of the date of the financial statements. Since the liability represents the present value of the net cash outflows of the underlying loan guarantees, the reestimation takes into account all factors that may have affected the estimate of each component of the cash flows, including prepayments, defaults, delinquencies, and recoveries. Any increase or decrease in the loan guarantee liability resulting from the reestimates is recognized as a subsidy expense (or a reduction in subsidy expense). Reporting the liability of loan guarantees and reestimates by component is not required.

In Appendix A, the Basis of the Board's Conclusions, it is pointed out that the primary factor that causes changes

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

in the subsidies would be default reestimates. The accounting standard provides a number of risk factors and other default cost criteria to be considered in making the default cost estimates and reestimates.

In the example, it is initially estimated that 60 percent of the loans will default on the principal repayments when the loans mature at the end of fiscal year 1999, and that $2,000 will be recovered from the sale of foreclosed assets. The first reestimate is made early in fiscal year 1995. Because so little time has passed since the subsidy was initially estimated, the estimated cash flows are unchanged and the reestimate is zero. (This illustration assumes that the interest rates at the time of commitment and disbursement are the same, so no reestimate is needed for the difference in interest rates.)

The second reestimation of the subsidy cost is made early in fiscal year 1996, in preparing financial statements for fiscal year 1995. It reestimates the loan guarantee liability as of the end of fiscal year 1994. It indicates that the initial default estimate is correct. However, it also indicates that the net recovery realized at the end of fiscal year 2000 would be $1,000, rather than $2,000. As shown in Table 25, because of the decrease in the amount of recovery, the present value of the net cash outflows discounted to the end of fiscal year 1994, is $2,406, rather than $1,701, as previously estimated for the end of fiscal year 1994 and shown in Table 23.

TABLE 25: SUBSIDY COST REESTIMATION: PROJECTED CASH FLOWS DISCOUNTED TO THE END OF FY 1994 (IN THOUSANDS OF DOLLARS)

	INTEREST SUPPLEMENTS	DEFAULT PAYMENTS	NET RECOVERIES	NET CASH FLOWS
FY 1995	$100			$ 100
1996	100			100
1997	100			100
1998	100			100
1999	100	$3,600		3,700
2000			$(1,000)	(1,000)
PV at 6	$421	$2,690	$(705)	$2,406

The reestimated liability is $2,406, compared to the existing liability of $1,701, an increase of $705. The

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

increase of $705 is added to the loan guarantee liability and is recognized as a subsidy expense reestimates.

The credit program receives a subsidy payment under permanent indefinite authority equal to $705 to cover the cost increase resulting from the reestimate. In addition, a payment of $42 is also received under permanent indefinite authority to cover the interest accrued on the $705 reestimate payment for the period from the end of fiscal year 1994 to the end of fiscal year 1995, and is reported as interest income. The total amount of $747 received is added to the fund balance.

(2) INTEREST COMPOUNDING

The accounting standard for post-1991 loan guarantees requires that interest be accrued and compounded on the liability of loan guarantees at the interest rate that was originally used to calculate the present value of the loan guarantee liabilities when the guaranteed loans were disbursed. The accrued interest is recognized as interest expense.

With the passage of time, the present value of the liability of the loan guarantees increases at a rate equal to the rate of interest used to discount the liability. The increase for fiscal year 1995 is $144, which equals the balance of the liability of $2,406, as reestimated, multiplied by the interest rate of 6 percent. The amount of the increase in the present value of the liability is added to the liability balance, and concurrently it is recognized as interest expense. As a result, the liability becomes $2,550.

Interest is also accrued on the credit program's fund balance of $1,701 at 6 percent. The amount of interest accrued is $102, which is added to the fund balance, and is recognized as interest income. As mentioned previously, the payments of $747 to cover the reestimated subsidy cost and the accrued interest are also added to the fund balance.

The interest supplement of $100 is paid for fiscal year 1995. Both the fund balance and the liability are reduced by $100.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

As a result of the above transactions, the fund balance becomes $2,450, calculated as follows:

Fund balance at the end of FY 1994	$1,701
Interest on the fund balance	102
Subsidy payment reestimates	705
Interest on subsidy payment reestimates	42
Interest supplement paid	(100)
Fund balance at the end of FY 1995	$2,450

The loan guarantee liability is also $2,450 at the end of fiscal year 1995, calculated as follows:

Liability balance at the end of FY 1994, as reestimated	$2,406
Increase due to passage of time	144
Interest supplement paid	(100)
Liability balance at the end of FY 1995	$2,450

Table 26 displays the asset and liability balances at the end of the 1995 fiscal year.

TABLE 26: ASSETS AND LIABILITIES AFTER INTEREST ACCUMULATIONS AT THE END OF FY 1995 (IN THOUSANDS OF DOLLARS)

ASSETS		LIABILITIES	
Fund balance with Treasury	$2,450	Loan guarantee liability	$2,450

C. REVENUES AND EXPENSES

The accounting standard for post-1991 loan guarantees requires that interest accrued on the liability of loan guarantees be recognized as interest expense, and that interest due from Treasury on uninvested funds be recognized as interest income. Interest accrued on debt to Treasury, if any, is recognized as interest expense.

In the example, interest accrued on the liability of loan guarantees is $144, which equals the reestimated liability of $2,406 times 6 percent. The amount is recognized as interest expense, and the same amount is added

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

to the liability, as explained above.

Interest income recognized for fiscal year 1995 is also $144, consisting of (a) interest income of $102 on the fund balance, which equals the fund balance of $1,701 times 6 percent, and (b) interest income of $42 on the subsidy payment reestimates.

Costs of administering loan guarantee activities, such as salaries, legal fees, and office costs, that are incurred for credit policy evaluation, origination, closing, servicing, monitoring, maintaining accounting and computer systems, and other credit administrative purposes, are recognized separately as administrative expenses. Administrative expenses are not included in calculating the subsidy costs of loan guarantees.

D. MODIFICATION OF POST-1991 LOAN GUARANTEES

Assume that in October 1995, shortly after the close of fiscal year 1995, the loan guarantee program takes action to expand its guarantee from 60 percent of the outstanding loan principal to 80 percent. This action is within the definition of direct modification because it is a government action that directly changes the estimated subsidy cost and the present value of the loan guarantee liability by altering the terms of the loan guarantee agreement.

The accounting standard on modifications of loan guarantees states that with respect to a direct or indirect modification of pre-1992 or post-1991 loan guarantees, the cost of modification is the excess of the post-modification liability of the loan guarantees over their pre-modification liability. The modification cost is recognized as modification expense when the loan guarantees are modified.

The accounting is implemented in the steps described below.

(1) CALCULATE THE PRE-MODIFICATION LIABILITY

The pre-modification liability is the present value of the net cash outflows of loan guarantees estimated at the time of modification under the pre-modification terms and discounted at the current discount rate.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

As used in this part and Part IV of this Appendix, the current discount rate is the interest rate applicable at the time of modification on marketable Treasury securities with a similar maturity to the remaining maturity of the guaranteed loans under pre-modification terms or post-modification terms, whichever is appropriate. [Footnote 27]

[Footnote 27: The definition of the current discount rate is provided in Appendix C, Glossary.]

The cash flows for the loan guarantees under pre-modification terms during 1996-2000 are assumed to be the same as the cash flows that were reestimated early in fiscal year 1996 for these years and that are shown in Table 25. Assume that the current discount rate for a comparable maturity (4 remaining years) is 4 percent. As Table 27 shows, the present value of the pre-modification net cash outflows discounted at 4 percent is $2,618.

TABLE 27: PRE-MODIFICATION LIABILITY (IN THOUSANDS OF DOLLARS; CALCULATED AT THE CURRENT DISCOUNT RATE)

	INTEREST SUPPLEMENTS	DEFAULT PAYMENTS	NET RECOVERIES	NET CASH FLOWS
FY 1996	$100			$ 100
1997	100			100
1998	100			100
1999	100	$3,600		3,700
2000			$(1,000)	(1,000)
PV at 4%	$363	$3,077	$(822)	$2,618

(2) CALCULATE POST-MODIFICATION LIABILITY

The loan guarantees' post-modification liability is the present value of the loan guarantees' net cash outflows estimated at the time of modification under post-modification terms and discounted at the current discount rate.

The modification increases the guarantee percentage from 60 percent to 80 percent. It is estimated that 60 percent or $6,000 in principal repayments will default.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

This estimate is not affected by the modification. However, with the expansion of the guarantee percentage, the credit program will pay 80 percent of the defaulted amounts, equal to $4,800, to the lenders. The net cash outflows estimated under the post-modification terms are discounted at the current rate of 4 percent. As shown in Table 28 below, the present value of the estimated net cash outflows is $3,644. This is the post-modification liability of the loan guarantees.

TABLE 28: POST-MODIFICATION LIABILITY (IN THOUSANDS OF DOLLARS; CALCULATED AT THE CURRENT DISCOUNT RATE)

	INTEREST SUPPLEMENTS	DEFAULT PAYMENTS	NET RECOVERIES	NET CASH FLOWS
FY 1996	$100			$ 100
1997	100			100
1998	100			100
1999	100	$4,800		4,900
2000			$(1,000)	(1,000)
PV at 4%	$363	$4,103	$(822)	$3,644

(3) CALCULATE AND RECOGNIZE THE COST OF MODIFICATION

The cost of modification is the excess of the loan guarantee's post-modification liability over their pre-modification liability. Since the loan guarantees' post-modification liability is $3,644, and their pre-modification liability is $2,618, the cost of modification is $1,026, which is recognized as a subsidy expense for modifications.

(4) CALCULATE THE CHANGE IN THE BOOK VALUE OF THE LIABILITY

The accounting standard on loan guarantee modifications requires that the existing book value of the liability of modified post-1991 loan guarantees be changed to an amount equal to the present value of the net cash outflows projected under the modified terms from the time of modification to the loans' maturity, and discounted at the original discount rate (the rate that is originally used to calculate the present value of the liability, when the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

guaranteed loans were disbursed).

In this example, the original discount rate is 6 percent. The present value of the loan guarantees' net cash outflows estimated under the modified terms and discounted at 6 percent is $3,401. (See Table 29.)

TABLE 29: POST-MODIFICATION BOOK VALUE LIABILITY (IN THOUSANDS OF DOLLARS; CALCULATED AT THE ORIGINAL DISCOUNT RATE)

	INTEREST SUPPLEMENTS	DEFAULT PAYMENTS	NET RECOVERIES	NET CASH FLOWS
FY 1996	$100			$ 100
1997	100			100
1998	100			100
1999	100	$4,800		4,900
2000			$(1,000)	(1,000)
PV at 6	$346	$3,802	$(747)	$3,40

At the time the modification action was taken, the existing book value of the loan guarantee liability was $2,450 (See Table 26). The book value is changed to $3,401. This is an increase of $951 in the book value of the loan guarantee liability.

(5) RECOGNIZE A GAIN OR LOSS

The accounting standard on loan guarantee modifications states that the change in the amount of liability of both pre-1992 and post-1991 loan guarantees resulting from a direct or indirect modification and the cost of modification will normally differ, due to the use of different discount rates or the use of different measurement methods. Any difference between the change in liability and the cost of modification is recognized as a gain or loss. For post-1991 loan guarantees, the modification adjustment transfer [Footnote 28] paid or received to offset the gain or loss is recognized as a financing source (or a reduction in financing source).

[Footnote 28: OMB instructions provide that if the increase in liability exceeds the cost of modification, the reporting entity receives from the Treasury an amount of modification adjustment transfer equal to the excess; and

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

if the cost of modification exceeds the increase in liability, the reporting entity pays to Treasury an amount of modification adjustment transfer to offset the excess. (See OMB Circular A-11.)]

The change in book value in this case is $951, compared to the cost of modification of $1,026. The difference between those two amounts is $75, which is recognized as a gain.

The credit program receives a subsidy appropriation equal to the cost of modification. Since the cost of modification exceeds the increase in book value by $75, the credit program pays to Treasury a modification adjustment transfer of $75 to offset the gain. This is reported as a reduction in financing source. The net effect of the modification is to increase the fund balance of the credit program by $951 to $3,401.

Table 30 displays the asset and liability balances after the modification in October 1995.

TABLE 30: ASSETS AND LIABILITIES AFTER THE MODIFICATION IN OCTOBER 1995 (IN THOUSANDS OF DOLLARS)

ASSETS		LIABILITIES	
Fund balance with Treasury	$3,401	Loan guarantee liability	$3,401

E. DEFAULT AND FORECLOSURE

Assume that for fiscal year 1996 and thereafter, annual reestimations do not result in any changes in cash flow estimates. [Footnote 29] After accumulating interest at 6 percent and paying the $100 interest supplement annually, the credit program has $3,856 in its fund balance with Treasury at the end of fiscal year 1999, prior to paying any default claims. Table 31 shows annual changes in the fund balance.

[Footnote 29: This assumption is made only to avoid repetitious illustrations.]

TABLE 31: FUND BALANCE (IN THOUSANDS OF DOLLARS)

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

AT THE END OF	INTEREST ACCRUED	INTEREST SUPPLEMENT PAID	FUND BALANCE
FY 1995			$3,401
1996	$204	$(100)	3,505
1997	210	(100)	3,615
1998	217	(100)	3,732
1999	22	(100)	3,856

At the same time, the program's loan guarantee liability at the end of fiscal year 1999 is also $3,856, which equals the estimated default claim payment of $4,800 minus $943, the present value of the estimated net recovery from foreclosing assets. It has been estimated that the net recovery would be $1,000 and would be realized at the end of fiscal year 2000. The present value of the net recovery discounted to the end of fiscal year 1999 at the original discount rate of 6 percent is $943.

As expected, when the guaranteed loans mature at the end of 1999, $6,000 of the principal is in default. To meet its guarantee obligation, the loan guarantee program must pay 80 percent of the default amount, or $4,800, to the lenders. When the defaults occur, the loan guarantee program in this example has the options to foreclose property pledged by the borrowers who defaulted, and/or to acquire the loans involved, as a compensation for the default payment.

The accounting standard on foreclosure requires that when property is transferred from borrowers to a federal credit program, through foreclosure or other means, as a compensation for losses that the government sustained under post-1991 loan guarantees,[Footnote 30] the foreclosed property be recognized as an asset at the present value of its estimated future net cash inflows discounted at the original discount rate.

[Footnote 30: The accounting standard is the same for property transferred in partial or full settlement of post-1991 direct loans, and the application of the standard to direct loans is illustrated by the present example of loan guarantees.]

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

The accounting standard states that at a foreclosure of guaranteed loans, a federal guarantor may acquire the loans involved. The acquired loans are recognized at the present value of their estimated net cash inflows from selling the loans or from collecting payments from the borrowers, discounted at the original discount rate.

In this example, the default occurs at the loans' maturity and virtually no cash inflows can be realized either from selling the loans or collecting payments from the borrowers. The loan guarantee program therefore forecloses the assets. It continues to estimate that the net cash inflow from possessing and selling the foreclosed property will be $1,000 and will be received at the end of fiscal year 2000. The present value of the estimated net cash inflow discounted at the original rate of 6 percent to the end of fiscal year 1999 is $943.

The accounting standard requires that if a legitimate claim exists by a third party or by the borrower to a part of the recognized value of the foreclosed assets, the present value of the estimated claim be recognized as a special contra valuation allowance.

In this example, no such claim is assumed. Thus, the present value of the foreclosed property is recorded as an asset at $943. Concurrently, the amount of $943 is credited to the loan guarantee liability, so that the loan guarantee liability is increased from $3,856 to $4,800.

The default payment of $4,800 is more than the fund balance of $3,856, and the loan guarantee program does not receive cash from selling the foreclosed assets until one year later. The loan guarantee program borrows the difference of $943 from Treasury. [Footnote 31] Thus, the fund balance is increased by $943 to $4,800, allowing the default payment to be made.

[Footnote 31: Borrowing from Treasury is necessary in this example because all default payments occur at the same time. If they occurred in different years, the default payments in most cases might be covered by the fund balance and the proceeds from selling foreclosed assets. Borrowing would only be needed for defaults near the maturity date of the guaranteed loans.]

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

When the default payment is made, both the fund balance and the loan guarantee liability are reduced to zero. The credit program takes collection action against the borrowers. However, further recovery is not anticipated. At this time, the loan guarantee program has the following asset and liability balances as shown in Table 32.

TABLE 32: ASSETS AND LIABILITIES AT THE END OF FY 1999 (IN THOUSANDS OF DOLLARS)

ASSETS		LIABILITIES	
Foreclosed property	$943	Debt to Treasury	$943

F. DISPOSITION OF THE FORECLOSED PROPERTY

The foreclosed property is initially recorded at the present value of the estimated net cash inflows. Until the property is sold, the present value of the property must be updated to recognize changes in value due to the passage of time. The recognition is made through an accrual of interest at the original discount rate. The amount of interest accrued for fiscal year 2000 is $57, which equals the book value of the foreclosed property at the beginning of the fiscal year, which is $943, times the original discount rate of 6 percent. This amount of interest is recognized as interest income, and is added to the book value of the foreclosed property. As a result, the book value of the foreclosed property becomes $1,000 at the end of fiscal year 2000.

Interest is also accrued on the debt to Treasury of $943 at the rate of 6 percent. The amount of interest for fiscal year 2000 is $57, and is recognized as interest expense. The amount is added to the debt to Treasury. As a result the debt to Treasury becomes $1,000 at the end of fiscal year 2000.

It is assumed that the property is sold at the end of fiscal year 2000 and the amount of net proceeds from the sale is $1,000. The amount of the net proceeds is used to pay off the debt to Treasury. As a result, the asset and liability balances for this cohort of loan guarantees are reduced to zero.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

A reestimation should be performed for the net cash flow of the property after the end of fiscal year 2000. If the reestimation resulted in a reduction of the present value of the property, the amount of the reduction would be recognized as subsidy expense reestimates. As illustrated in preceding sections on reestimates, a payment from permanent indefinite authority would be available to cover the subsidy reestimate expense. In this case, because the property was sold at the estimated time for the estimated amount, there is no reestimate subsidy expense.

PART IV PRE-1992 LOAN GUARANTEES

Pre-1992 loan guarantees are loan guarantees committed prior to October 1, 1991, and the liabilities under pre-1992 loan guarantees are recorded in liquidating accounts. The accounting standard requires that the liabilities of pre-1992 loan guarantees be recognized when it is more likely than not that the loan guarantees will require a future cash outflow to pay default claims. The liability of loan guarantees should be reestimated each year as of the date of the financial statements. In estimating liabilities, the risk factors discussed in the standard for post-1991 loan guarantees should be considered. Disclosure is made of the face value of guaranteed loans outstanding and the amount guaranteed.

The standard states that restatement of pre-1992 loan guarantees on a present value basis is permitted but not required.

All of the amounts used in the text that follows are in thousands of dollars.

A. RECOGNITION OF LIABILITIES

Assume that a federal credit program guarantees a group of loans and the guarantee was committed prior to October 1, 1991. At the end of fiscal year 1994, the loans have outstanding principal of $5,000 at 7 percent interest rate, maturing in three years. The borrowers are required to pay interest annually and to repay the principal at the end of 1997. The guarantee covers 60 percent of the principal.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

[Footnote 32]

[Footnote 32: A loan guarantee may guarantee both principal and interest payments. In that case, the estimate and recognition of loan guarantee liabilities should be based on defaults on both principal and interest payments.]

Disclosure is made in a footnote to the financial statements for fiscal year 1994 that guaranteed loans have an outstanding principal of $5,000, and the guaranteed amount is $3,000. (A similar disclosure is made in each year so long as the guaranteed loans are outstanding.)

The program management evaluates the risk factors enumerated in the accounting standard, and estimates that $2,500 of the loans' principal repayments would be defaulted when the loans mature. The program will pay 60 percent of the defaulted amount, equal to $1,500. It is also estimated that the credit program would realize a net recovery of $500 through acquiring and selling pledged assets. Thus, the program management recognizes a liability of $1,000, which equals the estimated default payment minus the net recovery. The $1,000 is charged to default expense. [Footnote 33]

[Footnote 33: This assumes that no liability was previously recognized. If a liability has been recognized for the loan guarantees, the liability should be adjusted to the current estimate, and any increase in liability should be charged to default expense.]

B. MODIFICATION OF PRE-1992 LOAN GUARANTEES

Assume that in October 1994, shortly after the close of fiscal year 1994, a decision is made to increase the guarantee from 60 percent of the loan payments to 80 percent. This action is within the definition of direct modification because it is a federal government action that directly changes the estimated subsidy cost and the present value of outstanding loan guarantees by altering the terms of existing contracts.

The accounting standard on modifications of loan guarantees states that with respect to a direct or indirect modification of pre-1992 or post-1991 loan guarantees, the cost of modification is the excess of the post-modification

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

liability of the loan guarantees over their pre-modification liability. The modification cost is recognized as modification expense when the loan guarantees are modified.

Accounting for the cost of modification takes the following steps:

(1) CALCULATE THE PRE-MODIFICATION LIABILITY

The pre-modification liability is the present value of the net cash outflows of the loan guarantees estimated at the time of modification under pre-modification terms and discounted at the current discount rate.

It is estimated that under the pre-modification terms, a default payment of $1,500 would be made at the end of fiscal year 1997, and a net recovery of $500 from the sale of foreclosed assets would be received at the end of fiscal year 1998. The current discount rate for a maturity of 3 years is 4 percent. As shown in Table 33, the present value of the estimated net cash outflows discounted at 4 percent is $906. This is the pre-modification liability of the loan guarantees.

TABLE 33: PRE-MODIFICATION LIABILITY (IN THOUSANDS OF DOLLARS,CALCULATED AT THE CURRENT DISCOUNT RATE)

	DEFAULT PAYMENTS	NET RECOVERIES	NET CASH OUTFLOW
FY 1995			
1996			
1997	$1,500		$1,500
1998		$(500)	(500)
PV at 4%	$1,333	$(427)	$906

(2) CALCULATE THE POST-MODIFICATION LIABILITY

The loan guarantees' post-modification liability is the present value of the loan guarantees' net cash outflows estimated at the time of modification under post-modification terms and discounted at the current discount rate.

The modification expands the guarantee from 60 percent

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

to 80 percent. It is estimated that $2,500 of the principal repayments will default when the loans mature. With the expansion of the guarantee percentage, the credit program will pay 80 percent of the defaulted amounts, equal to $2,000, to lenders at the end of fiscal year 1997. A net recovery of $500 would be received from selling foreclosed assets at the end of fiscal year 1998. The cash outflows estimated under the post-modification terms are discounted at the current discount rate of 4 percent. As shown in Table 34 below, The present value of the estimated net cash outflow is $1,351. This is the post-modification liability of the loan guarantees.

TABLE 34: POST-MODIFICATION LIABILITY (IN THOUSANDS OF DOLLARS,CALCULATED AT THE CURRENT DISCOUNT RATE)

	Default Payments	Net Recoveries	Net Cash Outflow
FY 1995			
1996			
1997	$2,000		$2,000
1998	$(500)		(500)
PV at 4%	$1,778	$(427)	$1,351

(3) CALCULATE AND RECOGNIZE THE COST OF MODIFICATION

The cost of modification is the excess of the loan guarantees' post-modification liability over their pre-modification liability. Since the loan guarantees' post-modification liability is $1,351, and their pre-modification liability is $906, the cost of modification is $445, which is recognized as a subsidy expense for modifications. A subsidy appropriation of that amount is required before the modification can take place. The appropriated amount is paid to the financing account.

(4) CALCULATE THE CHANGE IN THE BOOK VALUE OF THE LIABILITY

With respect to modifications of pre-1992 loan guarantees, the standard requires that when pre-1992 loan guarantees are directly modified, they be transferred to a financing account and the existing book value of the liability of the modified loan guarantees be changed to an

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

amount equal to their post-modification liability. Any subsequent modification is treated as a modification of post-1991 loan guarantees. [Footnote 34]

[Footnote 34: The accounting standard states that when pre-1992 loan guarantees are indirectly modified, they are kept in a liquidating account, and that the liability of those loan guarantees is reassessed and adjusted to reflect any change in the liability resulting from the modification. Indirect modifications of pre-1992 loan guarantees are not illustrated in the Appendix.]

Prior to the modification, the liability of the loan guarantees was recorded in a liquidating account at $1,000. Upon modification, the loan guarantees are transferred from the liquidating account to a financing account, since this is a direct modification. The liability is recorded in the financing account at the post-modification liability of $1,351. The change in book value of the liability is an increase of $351.

(5) RECOGNIZE A GAIN OR LOSS

The accounting standard on loan guarantee modifications states that the change in the amount of liability of both pre-1992 and post-1991 loan guarantees resulting from a direct or indirect modification and the cost of modification will normally differ, due to the use of different discount rates or the use of different measurement methods. Any difference between the change in liability and the cost of modification is recognized as a gain or loss.

In this case, the cost of modification is $445, and the change in book value is $351. The difference of $94 is recognized as a gain.

When the loan guarantees are transferred from the liquidating account to the financing account, the liquidating account pays the financing account an amount equal to the loan guarantees' pre-modification liability of $906. The transfer of the loan guarantees has the following effects on the liquidating account: (1) the existing liability of the transferred loan guarantees equal to $1,000 is removed, (2) the fund balance is reduced by $906, which is the amount paid to the financing account, and (3) a gain of $94 is recognized.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

The financing account records the liability of the loan guarantees at $1,351, which is their post-modification liability. It also records a fund balance of $1,351, which consists of the $906 received from the liquidating account, and the $445 appropriated to cover the cost of modification.

****

APPENDIX C: GLOSSARY

The glossary defines many terms used in this Statement. The definitions may be modified or superseded when relevant terms are considered or defined by the FASAB in future projects.

Book value: The net amount at which an asset or liability is carried on the books of account (also referred to as carrying value or amount). It equals the gross or nominal amount of any asset or liability minus any allowance or valuation amount.

Cohort: Those direct loans obligated or loan guarantees committed by a program in the same year even if disbursements occur in subsequent years. Post-1991 direct loans or loan guarantees will remain with their original cohort throughout the life of the loan, even if the loan is modified. Pre-1992 loans and loan guarantees that are modified shall each, respectively, constitute a single cohort. (OMB Circular No. A-11, Preparation and Submission of Budget Estimates, Executive Office of the President, Office of Management and Budget, July 1992, hereafter cited as OMB Circular No. A-11.)

Credit program: For the purpose of this Statement, a federal program that makes loans and/or loan guarantees to nonfederal borrowers.

Direct loan: A disbursement of funds by the government to a nonfederal borrower under a contract that requires the repayment of such funds within a certain time, with or without interest. The term includes the purchase of, or participation in, a loan made by another lender. (Adapted from OMB Circular No. A-11)

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

Econometric model: An equation or a set of related equations used to analyze economic data through mathematical and statistical techniques. Such models may be devised in order to depict the essential quantitative impact of alternative assumptions or government policies. (Dictionary of Banking and Finance, Jerry M. Rosenberg, Ph.D., Wiley & Sons, New York, 1982, hereafter cited as Rosenberg's Dictionary.)

Financing account: A non-budget account associated with each credit program account. The financing account holds fund balances, receives the subsidy cost payment from the credit program account, and includes all other cash flows to and from the government resulting from post-1991 direct loans or loan guarantees. (OMB Circular No. A-11, and OMB Circular No. A-34, Instructions on Budget Execution, Part VI, Credit Apportionment and Budget Execution, September, 1991, hereafter cited as OMB Circular No. A-34.)

Foreclosure: A method of enforcing payment of a debt secured by a mortgage by seizing the mortgaged property. Foreclosure terminates all rights that the mortgagor has in the mortgaged property upon completion of due process through the courts. (Treasury Financial Manual Supplement)

Interest method: A method used to amortize the premium or discount of an investment in bonds, or, as used in this Statement, to amortize the subsidy cost allowance of direct loans. Under this method, the amortization amount of the subsidy cost allowance equals the effective interest minus the nominal interest of the direct loans. The effective interest equals the present value of the direct loans times the effective interest rate (the discount rate). The nominal interest equals the nominal amount (face amount) of the direct loans times the stated interest rate (the rate stated in the loan agreements).

Liquidating account: The budget account that includes all cash flows to and from the government resulting from pre-1992 direct loans or loan guarantees (those originally obligated or committed before Oct. 1, 1991), except those pre-1992 direct loans and loan guarantees that have been directly modified and transferred to a financing account. (See OMB Circular No. A-11)

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

Loan guarantee: Any guarantee, insurance, or other pledge with respect to the payment of all or part of the principal or interest on any debt obligation of a nonfederal borrower to a nonfederal lender, but does not include the insurance of deposits, shares, or other withdrawable accounts in financial institutions. (OMB Circular No. A-11)

Loan guarantee commitment: A binding agreement by a federal agency to make a loan guarantee when specified conditions are fulfilled by the borrower, the lender, or any other party to the guarantee agreement. (OMB Circular No. A-11)

Modification: A federal government action, including new legislation or administrative action, that directly or indirectly alters the estimated subsidy cost and the present value of outstanding direct loans (or direct loan obligations), or the liability of loan guarantees (or loan guarantee commitments). Direct modifications are actions that change the subsidy cost by altering the terms of existing contracts or by selling loan assets. Indirect modifications are actions that change the subsidy cost by legislation that alters the way in which an outstanding portfolio of direct loans or loan guarantees is administered. The term modification does not include subsidy cost reestimates, the routine administrative workouts of troubled loans, and actions that are permitted within the existing contract terms.

Modification adjustment transfer: A non-expenditure transfer from a financing account to the Treasury, or vice versa, to offset the difference between the cost of modification of direct loans (or loan guarantees) and the change in the book value of direct loans (or loan guarantee liabilities). (See also OMB Circular A-11)

Nominal (or face or par)value or amount: The amount of a bond, note, mortgage, or other security as stated in the instrument itself, exclusive of interest or dividend accumulations. The nominal amount may or may not coincide with the price at which the instrument was first sold, its present market value, or its redemption price. Often referred to as the stated value. (Adapted from Kohler's Dictionary for Accountants, 6th ed., hereafter cited as

Kohler's Dictionary.)

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

Present value (PV): The value of future cash flows discounted to the present at a certain interest rate (such as the reporting entity's cost of capital), assuming compound interest. (Adapted from Kieso and Weygandt, Intermediate Accounting, 7th ed., p. 264.)

Program account: The budget account into which an appropriation to cover the subsidy cost of a direct loan or loan guarantee program is made and from which such cost is disbursed to the financing account. Usually, a separate amount for administrative expenses is also appropriated to the program account. (OMB Circular No. A-11)

Recourse: The rights of a holder in due course of a financial instrument (such as a loan) to force the endorser on the instrument to meet his or her legal obligations for making good the payment of the instrument if dishonored by the maker or acceptor. The holder in due course must have met the legal requirements of presentation and delivery of the instrument to the maker of a note or acceptor of a draft and must have found that this legal entity has refused to pay for or defaulted in payment of the instrument. (Rosenberg's Dictionary)

Reestimate: Refers to estimates of the subsidy costs performed subsequent to their initial estimates made at the time of a loan's disbursement.

Restatement (of direct loans or loan guarantees): Refers to establishing a new book value of a direct loan or the liability of a loan guarantee.

Risk category: Subdivisions of a cohort of direct loans or loan guarantees into groups of loans that are relatively homogeneous in cost, given the facts known at the time of obligation or commitment. Risk categories will group all loans obligated or committed for a program during the fiscal year that share characteristics predictive of defaults and other costs. (OMB Circular No. A-11)

Subsidy cost: The cost of a grant of financial aid, usually by a governmental body, to some person or institution for particular purposes. (Kohler's Dictionary)

Credit subsidy cost is the estimated long-term cost to the government of direct loans or loan guarantees

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

calculated on a net present value basis, excluding administrative costs. (Adapted from OMB Circular No. A-11)

Direct loan subsidy cost is the estimated long-term cost to the government of direct loans calculated on a present value basis, excluding administrative costs. The cost is the present value of estimated net cash outflows at the time the direct loans are disbursed. The discount rate used for the calculation is the average interest rate (yield) on marketable Treasury securities of similar maturity to the loan, applicable to the time when the loans are disbursed. (Adapted from OMB Circular No. A-11)

Loan guarantee subsidy cost is the estimated long-term cost to the government of loan guarantees calculated on a present value basis, excluding administrative costs. The cost is the present value of estimated net cash outflows at the time the guaranteed loans are disbursed by the lender. The discount rate used for the calculation is the average interest rate (yield) on marketable Treasury securities of similar maturity to the loan guarantees, applicable to the time when the guaranteed loans are disbursed. (Adapted from OMB Circular No. A-11)

Write-off: An action to remove an amount from an entity's assets. A write-off of a loan occurs when an agency official determines, after all appropriate collection tools have been used, that a debt is uncollectible. Active collection on an account ceases, and the account is removed from an entity's receivables. (Treasury Financial Manual Supplement)

The following additional terms have been defined specifically for the standard for modifications provided in this Statement. These terms are not intended for general application to other federal financial transactions.

Current discount rate: With respect to the modification of direct loans or loan guarantees, it is the discount rate used to measure the cost of a modification. It is the interest rate applicable at the time of modification on marketable Treasury securities with a similar maturity to the remaining maturity of the direct or guaranteed loans, under either pre-modification terms, or post-modification

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_2.pdf.

terms, whichever is appropriate.

Original discount rate: The discount rate originally used to calculate the present value of direct loans or loan guarantee liabilities, when the direct or guaranteed loans were disbursed.

Pre-modification liability: The present value of net cash outflows of loan guarantees estimated at the time of modification under the pre-modification terms, discounted at the current discount rate.

Pre-modification value: The present value of net cash inflows of direct loans estimated at the time of modification under pre-modification terms, discounted at the current discount rate.

Pre-1992 direct loans: Direct loans obligated before October 1, 1992.

Pre-1992 loan guarantees: Loan guarantees committed before October 1, 1992.

Post-modification liability: The present value of net cash outflows of loan guarantees estimated at the time of modification under the post-modification terms, discounted at the current discount rate.

Post-modification value: The present value of net cash inflows of direct loans estimated at the time of modification under the post-modification terms, discounted at the current discount rate.

Post-1991 direct loans: Direct loans obligated after September 30, 1992.

Post-1991 loan guarantees: Loan guarantees committed after September 30, 1992.

EXECUTIVE SUMMARY

1 This is the third statement of recommended accounting standards issued by the Federal Accounting Standards Advisory Board (referred to as FASAB or the Board). The standards presented in this document apply to several types of tangible property, other than long term fixed assets, held by federal government agencies.

2 These accounting standards cover the following assets:

-- inventory (i.e., items held for sale);

-- operating materials and supplies;

-- stockpile materials;

-- seized and forfeited property;

-- foreclosed property; and

-- goods held under price support and stabilization programs (including nonrecourse loans and purchase agreements).[Footnote 1.]

[Footnote 1: As well as addressing the commodities acquired through price support and stabilization programs, this

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

standard addresses nonrecourse loans and purchase agreements.]

The following tables summarize the provisions in the recommended accounting standards. The tables highlight the major provisions; they should not be substituted for close review of the standards themselves.

****

TABLE 1: SUMMARY OF ACCOUNTING STANDARDS

Standard	Description	Valuation Method	Recognition Requirements and comments
Inventory	Tangible personal property that is (1) held for sale, (2) in the process of production for sale, or (3) to be used in the provision of services for a fee	(1) Historical cost or any other valuation methods which approximate historical cost (2) Latest acquistion cost	As an asset upon receipt of title or goods. As cost of goods sold upon delivery to buyer. For latest acquisition cost, an allowance account will be established equal to the cumulative unrealized holding gains/ losses associated with ending inventory. Categories will be established for inventory held for sale; excess, obsolete, and unserviceable inventory; and inventory held for repair.
Operating materials and	Tangible personal property to be consumed in normal	Historical cost or any other valu-	The consumption method shall be applied. However,

and forfeited property	struments and property acquired as a result of orfeiture proceedings		forfeiture with a deferred revenue established. [Footnote 1] As revenue upon sale or disposition of nonmonetary forfeited property. As revenue upon forfeiture for monetary instruments.
Foreclosed property	Assets received in satisfaction of a loan receivable or as a result of a claim under a guaranteed or insured loan	Post-1991: [Footnote 2] net present value Pre-1992: [Footnote 3] lower of cost or net realizable value	As an asset upon foreclosure. .
Commoditites	Items acquired, held, sold, or otherwise disposed of to stabilize or support market prices.	Lower of cost or net realzable value	As an asset upon receipt. As a loss on farm price support if the net realizable value is less than the cost at acquisition. As an expense upon disposal or use.
Commodity nonrecourse loans	Short-term loans with commodities pledged as collateral	The principal amount of the loan less any allowance for for expected losses	As an asset upon issuance. As a loss on farm price support at reporting date if they are more likely than not and measurable.
Commodity purchase agreements	Agreements to purchase commodities at a given price at the option of the seller	Estimated amount of the contingent loss	As a contingent liability if the loss is more likely than not and measurable.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

[Footnote 1: Seized property other than monetary instruments would not be recognized as the entity's asset since it is not owned by the federal government. However, the market value of seized property should be disclosed in notes to the financial statements. This recognizes that the entity has a fiduciary responsibility for the property.

Seized monetary instruments are recognized as assets with an offsetting liability to recognize the potential for remission to the owners. This treatment was provided in order to maintain a higher level of financial control over seized monetary instruments.]

[Footnote 2: "Post-1991" refers to foreclosed property that is received in satisfaction of loans obligated or loan guarantees committed after September 30, 1991.]

[Footnote 3: "Pre-1992" refers to foreclosed property that is received in satisfaction of loans obligated or loan guarantees commmitted before October 1, 1991. In addition, any programs or agencies that are specifically exempt from the provisions of the Federal Credit Reform Act should follow accounting provisions for "pre-1992" property.]

****

INTRODUCTION

OBJECTIVE

4 In this Statement, the Board recommends accounting standards for six assets of the federal government and its entities. The first group of assets addressed, those formerly referred to as "inventory," includes inventory held for sale, operating materials and supplies, stockpile materials, and commodities. The decision to include other assets held for sale resulted in adding two items: (1) seized and forfeited property and (2) foreclosed property.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

APPROACH

5 Following publication of the Exposure Draft in January 1993, the Board received comments from 44 organizations and individuals. A public hearing, at which eight people presented oral comments on the Exposure Draft, was held on April 21 and 22, 1993.

6 In preparing this Statement of recommended standards, the Board considered all the comments received and incorporated changes, as appropriate. The issues raised and the specific changes made are discussed in Appendix A, "Basis of the Board's Conclusions."

MATERIALITY

7 In preparing the standards, the Board intended that their application be limited to items that are material. "Materiality" has not been strictly defined in the accounting community; rather, it has been a matter of judgment on the part of preparers of financial statements and the auditors who attest to them. The Board proposes relying on the Financial Accounting Standards Board's (FASB) concept as modified by certain concepts expressed in governmental auditing standards. Presented below is the Board's position on the issue of materiality at this time.

8 The accounting and reporting provisions of the Board's accounting standards need not be applied to immaterial items. The determination of whether an item is immaterial requires the exercise of considerable judgment, based on consideration of specific facts and circumstances.

9 FASB's Statement of Accounting Concepts No. 2, "Qualitative Characteristics of Accounting Information," discusses the concept of materiality. According to this statement, the determination of whether an item is material depends on the degree to which omitting or misstating information about this item makes it probable that the judgment of a reasonable person relying on the information would have been changed or influenced by the omission or the misstatement. This concept includes both qualitative and quantitative considerations. An item that is not considered material from a quantitative standpoint may be considered qualitatively material if it would influence or change the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

judgment of the financial statement user.

10 The Board believes that FASB's definition of materiality is generally appropriate for use in applying the accounting and reporting provisions of the Board's accounting standards. In the federal government environment, however, the definition is extended to apply to all financial information included in the annual financial report and, therefore, is not limited to the principal schedules and related notes.

11 In applying the concept of materiality, the needs of the users of the annual financial report should also be considered. In the federal government environment, such needs generally differ from those of users of commercial entity financial statements. For example, federal government financial statement user needs extend to having the ability to assess the efficiency and the effectiveness of the entity's programs. Further, compliance with budget and other finance-related laws, rules, and regulations is also a significant consideration of such users.

12 This is expressed well in the "Government Auditing Standards" (the "Yellow Book"):

> "In government audits the materiality level and/or threshold of acceptable risk may be lower than in similar-type audits in the private-sector because of the public accountability of the entity, the various legal and regulatory requirements, and the visibility and sensitivity of government programs, activities, and functions." (Ch. 3, par. 33.)

13 While this standard applies to an auditor's evaluation of materiality rather than a preparer's, it does provide insight into the factors affecting materiality in the federal government.

14 Therefore, the accounting and reporting provisions of the Board's recommended standards should be applied to all items that would influence or change the users' judgments of the entity's efficiency and the effectiveness and its compliance with laws and regulations in a material manner.

15 In order to emphasize that materiality should be

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

considered in applying all accounting standards, the Board has decided to place a notice at the end of each recommended accounting standard. The notice will read as follows:

> The provisions of this statement need not be applied to immaterial items.

EFFECTIVE DATE

16 The Board recommends that the accounting standards presented in this Statement become effective for fiscal years ending September 30, 1994, and thereafter. Earlier implementation is encouraged.

****

The Accounting Standards -- INVENTORY

INVENTORY

DEFINITION. 17 "Inventory" is tangible personal property that is (1) held for sale, (2) in the process of production for sale, or (3) to be consumed in the production of goods for sale or in the provision of services for a fee. The term "held for sale" shall be interpreted to include items for sale or transfer to (1) entities outside the federal government, or (2) other federal entities. The principal objective of the sale or transfer of inventory is to provide a product or service for a fee that generally recovers full cost or an identified portion of the cost. "Other federal entities" may include entities within the same organization/agency. Sales transactions may be executed through transfer of funds between federal entities; it is not essential that the transaction be an exchange of goods for cash or cash equivalents. In addition, inventory may be acquired through donation or barter. Inventory excludes some other assets held for sale, such as (1) stockpile materials, (2) seized and forfeited property, (3) foreclosed property, and (4) goods held under price support and stabilization programs. These items may be sold; however, the purpose of acquiring them is not to provide a product or a service for a fee.

18 Inventory shall be categorized as (1) inventory held for sale, (2) inventory held in reserve for future

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

sale, (3) excess, obsolete and unserviceable inventory, or (4) inventory held for repair. These categories are defined in paragraphs 17, 27, 29, and 32 respectively.

RECOGNITION. 19 Inventory shall be recognized when title passes to the purchasing entity or when the goods are delivered to the purchasing entity. Upon sale (when the title passes or the goods are delivered) or upon use in the provision of a service, the related expense shall be recognized and the cost of those goods shall be removed from inventory. Delivery or constructive delivery shall be based on the terms of the contract regarding shipping and/or delivery.

VALUATION. 20 Inventory shall be valued at either (1) historical cost or (2) latest acquisition cost.

(1) 21 Historical cost shall include all appropriate purchase, transportation and production costs incurred to bring the items to their current condition and location. Any abnormal costs, such as excessive handling or rework costs, shall be charged to operations of the period. Donated inventory shall be valued at its fair value at the time of donation. Inventory acquired through exchange of nonmonetary assets (e.g., barter) shall be valued at the fair value of the asset received at the time of the exchange. Any difference between the recorded amount of the asset surrendered and the fair value of the asset received shall be recognized as a gain or a loss.

22 The first-in, first-out (FIFO); weighted average; or moving average cost flow assumptions may be applied in arriving at the historical cost of ending inventory and cost of goods sold. In addition, any other valuation method may be used if the results reasonably approximate those of one of the above historical cost methods (e.g., a standard cost system).

(2) 23 The latest acquisition cost method provides that the last invoice price[Footnote 2.], (i.e., the specific item's actual cost used in setting the current year stabilized standard [sales] price) be applied to all like units held including those units acquired through donation or nonmonetary exchange. The inventory shall be revalued periodically but at least at the end of each fiscal year. Revaluation results in recognition of unrealized holding

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

gains/losses in the ending inventory value. Upon adjustment for unrealized holding gains/losses, the latest acquisition cost method then results in an approximation of historical cost.

24 An allowance for unrealized holding gains/losses in inventory shall be established to capture these gains/losses. The ending balance of this allowance shall be the cumulative difference between the historical cost, based on estimated or actual valuation, and the latest acquisition cost of ending inventory. The balance shall be adjusted each time the inventory balance is adjusted. The adjustment necessary to bring the allowance to the appropriate balance shall be a component of cost of goods sold for the period as described below.

25 The cost of goods sold for the period shall be computed as follows:

	Beginning inventory at beginning-of-the-period latest acquisition cost
LESS	allowance for unrealized holding gains/losses at the beginning-of-the-period
PLUS	actual purchases
EQUALS	Cost of Goods Available for Sale
LESS	ending inventory at end-of-the-period latest acquisition cost
PLUS	allowance for unrealized holding gains/losses at the end-of-period
EQUALS	Cost of Goods Sold

EXCEPTION TO VALUATION. 26 Valuing inventories at expected net realizable value is acceptable if there is (1) an inability to determine approximate costs, (2) immediate marketability at quoted prices, and (3) unit interchangeability (e.g., petroleum reserves). Application of this exception may result in inventories being valued at greater than historical cost.

Other Categories of Inventory

INVENTORY HELD IN RESERVE FOR FUTURE SALE. 27 Inventory stocks may be maintained because they are not readily available in the market or because there is more than a remote chance that they will eventually be needed

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

(although not necessarily in the normal course of operations). These stocks shall be classified as inventory held in reserve for future sale. Inventory held in reserve for future sale shall be valued using the same basis as inventory held for sale in normal operations. The value of inventory held in reserve for future sale shall be either (1) included in the inventory line item on the face of the financial statements with separate disclosure in footnotes or (2) shown as a separate line item on the face of the financial statements.

28 The criteria considered by management in identifying inventory held in reserve for future sale shall be disclosed. Examples of factors to be considered in developing the criteria are (1) all relevant costs associated with holding these items (including the storage and handling costs), (2) the expected replacement cost when needed, (3) the time required to replenish inventory, (4) the potential for deterioration or pilferage, and (5) the likelihood that a supply of the items will be available in the future.

EXCESS, OBSOLETE, AND UNSERVICEABLE INVENTORY. 29 "Excess inventory" is inventory stock that exceeds the demand expected in the normal course of operations because the amount on hand is more than can be sold in the foreseeable future and that does not meet management's criteria to be held in reserve for future sale. "Obsolete inventory" is inventory that is no longer needed due to changes in technology, laws, customs, or operations. "Unserviceable inventory" is damaged inventory that is more economical to dispose of than to repair. The category "excess, obsolete and unserviceable inventory" shall be either (1) included in the inventory line item on the face of the financial statements with separate disclosure in footnotes or (2) shown as a separate line item on the face of the financial statements.

30 Such inventory shall be valued at its expected net realizable value. The difference between the carrying amount of the inventory before identification as excess, obsolete or unserviceable and its expected net realizable value shall be recognized as a loss (or gain) and either separately reported or disclosed. Any subsequent adjustments to its net realizable value or any loss (or gain) upon disposal shall also be recognized as a loss (or gain).

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

31 Management shall develop and disclose in the financial statements its criteria for identifying excess, obsolete and unserviceable inventory.

INVENTORY HELD FOR REPAIR. 21 Inventory held for repair may be treated in one of two ways: (1) the allowance method or (2) the direct method.

(1) Under the allowance method, inventory held for repair shall be valued at the same value as a serviceable item. However, an allowance for repairs contra-asset account (i.e., repair allowance) shall be established. The annual (or other period) credit(s) required to bring the repair allowance to the current estimated cost of repairs shall be recognized as current period operating expenses. As the repairs are made the cost of repairs shall be charged (debited) to the allowance for repairs account.

(2) 33 Under the direct method, inventory held for repair shall be valued at the same value as a serviceable item less the estimated repair costs. When the repair is actually made, the cost of the repair shall be capitalized in the inventory account up to the value of a serviceable item. Any difference between the initial estimated repair cost and the actual repair cost shall be either debited or credited to the repair expense account.

34 Transition to either of these two methods may result in recognizing an accumulated amount of needed repairs that were not previously accounted for. To avoid overstating repair expense for the first period that repair expense is accrued, prior period amounts are to be separately identified or estimated. The estimated amount to repair inventory that is attributable to prior periods shall be credited to the repair allowance under the repair allowance method or to the inventory account under the direct method and reported as an adjustment to equity.

Disclosure Requirements 35

-- General composition of inventory.

-- Basis for determining inventory values; including the valuation method and any cost flow assumptions.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

-- Changes from prior year's accounting methods; if any.

-- Balances for each of the following categories of inventory; inventory held for current sale, inventory held in reserve for future sale, excess, obsolete and unserviceable inventory, and inventory held for repair unless otherwise presented on the financial statements.

-- Restrictions on the sale of material.

-- The decision criteria for identifying the category to which inventory is assigned.

-- Changes in the criteria for identifying the category to which inventory is assigned.

The provisions of this statement need not be applied to immaterial items.

****

The Accounting Standards -- OPERATING MATERIALS AND SUPPLIES

OPERATING MATERIALS AND SUPPLIES

DEFINITION. 36 "Operating materials and supplies" consist of tangible personal property to be consumed in normal operations. Excluded are (1) goods that have been acquired for use in constructing real property or in assembling equipment to be used by the entity, (2) stockpile materials, (3) goods held under price stabilization programs, (4) foreclosed property, (5) seized and forfeited property, and (6) inventory.

37 Operating materials and supplies shall be categorized as (1) operating materials and supplies held for use, (2) operating materials and supplies held in reserve for future use, or (3) excess, obsolete and unserviceable operating materials and supplies. These categories are defined in paragraphs 36, 45, and 47 respectively.

RECOGNITION. 38 The consumption method of accounting for the recognition of expenses shall be applied for operating materials and supplies. Operating materials and

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

supplies shall be recognized and reported as assets when produced or purchased. "Purchased" is defined as when title passes to the purchasing entity. If the contract between the buyer and the seller is silent regarding passage of title, title is assumed to pass upon delivery of the goods. Delivery or constructive delivery shall be based on the terms of the contract regarding shipping and/or delivery.

39 The cost of goods shall be removed from operating materials and supplies (i.e., the asset account) and reported as an operating expense in the period they are issued to an end user for consumption in normal operations.

40 If (1) operating materials and supplies are not significant amounts, (2) they are in the hands of the end user for use in normal operations, or (3) it is not cost-beneficial to apply the consumption method of accounting, then the purchases method may be applied to operating materials and supplies. The purchases method provides that operating materials and supplies be expensed when purchased.

41 An end user is any component of a reporting entity that obtains goods for direct use in the component's normal operations. Any component of a reporting entity, including contractors, that maintains or stocks operating materials and supplies for future issuance shall not be considered an end user.

VALUATION UNDER THE CONSUMPTION METHOD. 42 Operating materials and supplies shall be valued on the basis of historical cost.

43 Historical cost shall include all appropriate purchase and production costs incurred to bring the items to their current condition and location. Any abnormal costs, such as excessive handling or rework costs, shall be charged to operations of the period. Donated operating materials and supplies shall be valued at their fair value at the time of donation. Operating materials and supplies acquired through exchange of nonmonetary assets (e.g., barter) shall be valued at the fair value of the asset received at the time of the exchange. Any difference between the recorded amount of the asset surrendered and the fair value of the asset received shall be recognized as a gain or a loss.

44 The first-in, first-out (FIFO); weighted average;

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

or moving average cost flow assumptions shall be applied in arriving at the historical cost of ending operating materials and supplies and cost of goods consumed. In addition, any other valuation method may be used if the results reasonably approximate those of one of the above historical cost methods (e.g., a standard cost or latest acquisition cost system).

Other Categories of Operating Materials and Supplies

OPERATING MATERIALS AND SUPPLIES HELD IN RESERVE FOR FUTURE USE.

45 Operating materials and supplies stocks may be maintained because they are not readily available in the market or because there is more than a remote chance that they will eventually be needed, although not necessarily in the normal course of operations. These stocks shall be classified as operating materials and supplies held in reserve for future use. Operating materials and supplies held in reserve for future use shall be valued using the same basis as operating materials and supplies held for use in normal operations. The value of operating materials and supplies held in reserve for future use shall be either (1) included in the operating materials and supplies line item on the face of the financial statements with separate disclosure in footnotes or (2) shown as a separate line item on the face of the financial statements. Such materials and supplies shall be valued the same as operating materials and supplies held for use in normal operations.

46 The criteria considered by management in identifying operating materials and supplies held in reserve for future use shall be disclosed. Examples of factors to be considered in developing the criteria are (1) all relevant costs associated with holding these items (including the storage and handling costs); (2) the expected replacement cost when needed; (3) the time required to replenish operating materials and supplies; (4) the potential for deterioration or pilferage; and (5) the likelihood that a supply of the item will be available in the future.

EXCESS, OBSOLETE, AND UNSERVICEABLE OPERATING MATERIALS AND SUPPLIES. 47 "Excess operating materials and supplies" are operating materials and supplies stocks that exceed the amount expected to be used in normal operations because the amount on hand is more than can be used in the foreseeable

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

future and that do not meet management's criteria to be held in reserve for future use. "Obsolete operating materials and supplies" are operating materials and supplies that are no longer needed due to changes in technology, laws, customs, or operations. "Unserviceable operating materials and supplies" are operating materials and supplies that are physically damaged and cannot be consumed in operations. The category "excess, obsolete and unserviceable operating materials and supplies" shall be either (1) included in the operating materials and supplies line item on the face of the financial statements with separate disclosure in footnotes or (2) shown as a separate line item on the face of the financial statements.

48 Such operating materials and supplies shall be valued at their estimated net realizable value. The difference between the carrying amount of the operating materials and supplies before identification as excess, obsolete or unserviceable and their estimated net realizable value shall be recognized as a loss (or gain) and either reported separately or disclosed. Any subsequent adjustments to their estimated net realizable value or any loss (or gain) upon disposal shall also be recognized as a loss (or gain).

49 Management shall develop and disclose in the financial statements its criteria for identifying excess, obsolete, and unserviceable operating materials and supplies.

Disclosure Requirements. 50

-- General composition of operating materials and supplies.

-- Basis for determining operating materials and supplies values; including valuation method and any cost flow assumptions.

-- Changes from prior year's accounting methods, if any.

-- Balances for each of the categories of operating materials and supplies described above.

-- Restrictions on the use of material.

-- Decision criteria for identifying the category to which operating materials and supplies are assigned.

-- Changes in the criteria for identifying the category to which operating materials and supplies are assigned.

The provisions of this statement need not be applied to immaterial items.

****

The Accounting Standards -- STOCKPILE MATERIALS

STOCKPILE MATERIALS

DEFINITION. 51 "Stockpile materials" are strategic and critical materials held due to statutory requirements for use in national defense, conservation or national emergencies. They are not held with the intent of selling in the ordinary course of business. The following items are specifically excluded from stockpile materials: (1) items that are held by an agency for sale or use in normal operations (see proposed standards for inventory and operating materials and supplies), (2) items that are held for use in the event of an agency's operating emergency or contingency (see proposed standard for operating materials and supplies), and (3) materials acquired to support market prices (see proposed standard for goods held under price support and stabilization programs).

RECOGNITION. 52 The consumption method of accounting for the recognition of expense shall be applied for stockpile materials. These materials shall be recognized as assets and reported when produced or purchased. "Purchase" is defined as the date that title passes to the purchasing entity. If the contract between the buyer and the seller is silent regarding passage of title, title is assumed to pass upon delivery of the goods. The cost of stockpile materials shall be removed from stockpile materials and reported as an operating expense when issued for use or sale.

VALUATION. 53 Stockpile materials shall be valued on the basis of historical cost. Historical cost shall include

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

all appropriate purchase, transportation and production costs incurred to bring the items to their current condition and location. Any abnormal costs, such as excessive handling or rework costs, shall be charged to operations of the period. The first-in, first-out (FIFO); weighted average; or moving average cost flow assumptions shall be applied in arriving at the historical cost of stockpile materials. In addition, any other valuation method may be used if the results reasonably approximate those of one of the above historical cost methods (e.g., a standard cost or latest acquisition cost system).

EXCEPTION TO VALUATION. 54 The carrying amount of materials that have suffered (1) a permanent decline in value to an amount less than their cost or (2) damage or decay shall be reduced to the expected net realizable value of the materials. The decline in value shall be recognized as a loss or an expense in the period in which it occurs.

HELD FOR SALE. 55 When stockpile materials are authorized to be sold, those materials shall be disclosed as stockpile materials held for sale. The materials authorized for sale shall be valued using the same basis used before they were authorized for sale. Any difference between the carrying amount of the stockpile materials held for sale and their estimated selling price shall be disclosed. The cost of stockpile materials shall be removed from stockpile materials and reported as cost of goods sold when sold. Any gain (or loss) upon disposal shall be recognized as a gain (or loss) at that time.

Disclosure Requirements. 56

-- General composition of stockpile materials.
-- Basis for valuing stockpile materials; including valuation method and any cost flow assumption.

-- Changes from prior year's accounting methods, if any.

-- Restrictions on the use of materials.

-- Balances of stockpile materials in each category described above (i.e, stockpile materials and

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

stockpile materials held for sale).

-- Decision criteria for categorizing stockpile materials as held for sale.

-- Changes in criteria for categorizing stockpile materials as held for sale.

The provisions of this statement need not be applied to immaterial items.

****

The Accounting Standards -- SEIZED AND FORFEITED PROPERTY

SEIZED AND FORFEITED PROPERTY

57 As a consequence of various laws, certain property is seized by authorized law enforcement agencies. In some instances, there may be as many as three government entities involved with seized property. The first is the seizing agency. Second, the seizing agency may turn the property over to a custodial agency. Third, financial records may be maintained by a "central fund" created to support the seizure activities of multiple agencies. Alternatively, the seizing agency may carry out one or both of the custodial agency or central fund roles.

58 The seized assets may be subsequently forfeited to the government through abandonment or administrative or judicial procedures. The forfeited property is then sold, converted for use by the government, or transferred to other governmental entities. Because this property is first seized, then all or a portion of it is forfeited, this standard separately addresses the accounting and reporting for seized property and the accounting and reporting for forfeited property.

SEIZED PROPERTY

DEFINITION. 59 "Seized property" includes monetary instruments, real property and tangible personal property of others in the actual or constructive possession of the custodial agency.

RECOGNITION. 60 Seized property shall be accounted

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

for in the financial records of the entity that is operating as the central fund.[Footnote 3.]

[Footnote 3: If the central fund is other than the seizing or custodial agency, the latter should maintain sufficient internal records to carry out its stewardship responsibility.]

61 Seized monetary instruments shall be recognized as seized assets when seized. In addition, a liability shall be established in an amount equal to the seized asset value. Seized monetary instruments are recognized upon seizure due to (1) the fungible nature of monetary instruments and (2) the high level of control over the assets that is necessary.

62 Seized property other than monetary instruments shall be disclosed in the footnotes. The value of the seized property shall be accounted for in an agency's property management records until the property is forfeited, returned, or otherwise liquidated.

VALUATION. 63 Seized property shall be valued at its market value when seized or, if market value cannot be readily determined, as soon thereafter as reasonably possible. Market value shall be based on the value of the property assuming an active market exists for the property. If no active market exists for the property in the general area in which it was seized, a value in the principal market nearest the place of seizure shall be used.

EXCEPTIONS TO VALUATION. 64 Valuation of property seized under the Internal Revenue Code shall be based on the taxpayer's equity, that is, market value less any third-party liens.

65 Seized monetary instruments shall be valued at their market value.

Disclosure Requirements. 66

-- Explanation of what constitutes a seizure and a general description of the composition of seized property.

-- Method(s) of valuing seizures.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

-- Changes from prior year's accounting methods; if any.

-- Analysis of change in seizures, including the dollar value and number of seized property that are (1) on hand at the beginning of the year, (2) made during the year, (3) disposed of during the year, and (4) on hand at the end of the year as well as known liens or other claims against the property. This information should be presented by type of seizure and method of disposition where material.

FORFEITED PROPERTY

67 This subsection defines "forfeited property" and presents the accounting and reporting standards for them. Presented below are examples of forfeited property.

-- monetary instruments,

-- intangible property,

-- real property and tangible personal property,

-- property acquired by the government in satisfaction of a tax liability, and

-- unclaimed and abandoned merchandise.

DEFINITION. 68 "Forfeited property" consists of (1) monetary instruments, intangible property, real property, and tangible personal property acquired through forfeiture proceedings; (2) property acquired by the government to satisfy a tax liability; and (3) unclaimed and abandoned merchandise.

RECOGNITION AND VALUATION. 69 Monetary instruments shall be reclassified from seized monetary instruments to forfeited monetary instruments when forfeited. Monetary instruments shall be valued at their market value when a forfeiture judgment is obtained. When the asset is recorded, revenue shall be recognized in an amount equal to the value

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

of the monetary instrument and the associated liability for possible remittance shall be removed.

70 Intangible property, real property and tangible personal property shall be recorded with an offsetting deferred revenue when forfeiture judgment is obtained. When a determination is made that property will not be sold, the property shall be reclassified as forfeited property held for donation or use. The property shall be valued at its fair value at the time of forfeiture. A valuation allowance shall be established for liens or claims from a third-party. This allowance shall be credited for the amount of any expected payments to third-party claimants.

71 Forfeited property that cannot be sold due to legal restrictions but which may be either donated or destroyed shall be subject to the disclosure requirements described below. However, no financial value shall be recognized for these items.

72 Revenue from the sale of property shall be recognized when the property is sold.

73 Property not held for sale may be

-- placed into official use,

-- transferred to another federal government agency,

-- distributed to a state or local law enforcement agency, or

-- distributed to a foreign government.

74 When a determination is made that property will be distributed in one of the ways described above and not held for sale, the property shall be reclassified as forfeited property held for donation or use. Revenue associated with property not disposed of through sale shall be recognized upon approval of distribution and the previously established deferred revenue shall be reversed.

75 Revenue shall be classified as it arises from sale or from disposition, and this distinction shall be maintained in the entity's accounting reports.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

76 Property acquired by the government in satisfaction of a taxpayer's liability shall be recorded when title to the property passes to the federal government. At that time, a credit shall be made to the related account receivable. The property shall be valued at its market value less any third-party liens. Upon sale of the property, revenue shall be recognized in the amount of the sale proceeds and the property and the third-party liens are removed from the accounts.

77 Unclaimed and abandoned merchandise shall be recorded with an offsetting deferred revenue when statutory and/or regulatory requirements for forfeiture have been met. The merchandise shall be valued at its market value. Upon sale of the merchandise, revenue shall be recognized in the amount of the sale proceeds and the merchandise and the deferred revenue are removed from the accounts.

Disclosure Requirements. 78

-- Composition of forfeited property.

-- Method(s) of valuing forfeited property.

-- Restrictions on the use or disposition of forfeited property.

-- Changes from prior year's accounting methods, if any.

-- Analysis of change in forfeited property providing the dollar value and number of forfeitures that (1) are on hand at the beginning of the year, (2) are made during the year, (3) are disposed of during the year and the method of disposition, and (4) are on hand at the end of the year. This information would be presented by type of property forfeited where material.

-- If available, an estimate of the value of property or funds to be distributed to federal, state and local agencies in future reporting periods.

The provisions of this statement need not be applied to immaterial items.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

****

The Accounting Standards -- FORECLOSED PROPERTY

FORECLOSED PROPERTY

DEFINITION. 79 The term "foreclosed property" means any asset received in satisfaction of a loan receivable or as a result of payment of a claim under a guaranteed or insured loan (excluding commodities acquired under price support programs). All properties included in foreclosed property are assumed to be held for sale.

80 In accordance with the Federal Credit Reform Act of 1990, the remainder of this standard will refer to specific provisions for pre-1992 foreclosed property and post-1991 foreclosed property. "Pre-1992 foreclosed property" refers to property associated with direct loans obligated or loan guarantees committed before October 1, 1991. "Post-1991 foreclosed property" refers to property associated with direct loans obligated or loan guarantees committed after September 30, 1991. The distinction is necessary because for budget purposes, the cash flows associated with post-1991 direct loans and loan guarantees, including the cash flows associated with post-1991 foreclosed property, must be measured on a present value basis. However, pre-1992 foreclosed property need not be valued on this basis. Additionally, any programs that are specifically exempt from the use of present value techniques for determining the costs of direct loans and loan guarantees shall rely on the accounting principles provided for pre-1992 foreclosed property.

VALUATION OF FORECLOSED PROPERTY. 81 Post-1991 foreclosed property is valued at the net present value of the projected future cash flows associated with the property. Pre-1992 foreclosed property is recorded at cost and adjusted to the lower of cost or its net realizable value; any difference is carried in a valuation allowance. Both of these methods are described further below. For either post-1991 or pre-1992 foreclosed property, other valuation methods may be used as an approximation for the above methods if no material differences in valuation will result.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

NET PRESENT VALUE. 82 The first step in determining net present value is projecting the future cash flows associated with the property. The projected future cash flows shall include estimates of (1) the sales proceeds, (2) rent, management expense, and repair costs during the holding period, and (3) selling expenses (e.g., advertising and commissions). In estimating the sales proceeds, the entity's historical experience in selling property and the nature of the sale shall be considered. For instance, market value based on sales between willing buyers and sellers may not be appropriate for properties to be disposed of in a forced or liquidation sale. If the entity has historically been unable to realize the fair value of property, this shall be considered in estimating sales proceeds.

83 The second step is to discount these cash flows to their present value. In order to place the projected cash flows on a present value basis, a discount (interest) rate must be selected. The discount rates used shall be the same rates that were used to discount the cash flows of the related loans or guarantees.

84 Following foreclosure, the net present value (measured in a manner consistent with the measurement at the time of foreclosure) shall be adjusted periodically to recognize both changes in the expected future cash flows and for accrual of interest due to the passage of time. Any adjustments to the carrying amounts shall be included in the presentation of "interest income" and the reestimate of "subsidy expense."

NET REALIZABLE VALUE. 85 Pre-1992 foreclosed property held for sale should be reported in the entity's financial statements at expected net realizable value. The expected net realizable value shall be based on an estimate of the market value of the property adjusted for any expected losses and any other costs of the sale. The estimate of market value shall be based on (1) the market value of the property if an active market exists; (2) the market value of similar properties if no active market exists; or (3) a reasonable forecast of expected cash flows adjusted for estimates of all holding costs, including any cost of capital. In addition to considering market value, the expected net realizable value shall consider the entity's historical experience in disposing of foreclosed properties;

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

i.e., if the entity is typically unable to obtain market value for properties, the expected net realizable value shall be adjusted to be consistent with historically experienced losses. Additionally, if the entity will not be able to sell the property under normal market conditions or is forced to sell the property within a given time, this factor shall be considered in arriving at net realizable value.

86 If the expected net realizable value is less than the cost, a loss has occurred. This loss shall be charged to operations, and a valuation allowance shall be established. If the asset's net realizable value subsequently increases or decreases, this amount shall be credited or charged to results of operations and the valuation allowance adjusted. However, the asset value shall not be adjusted above cost.

ASSETS SUBJECT TO CLAIMS OF OTHER PARTIES. 87 If the property is taken subject to claims of the lender, debtor, or other party, these claims shall be accounted for in a valuation allowance. These claims can be in the form of a lien or a residual interest of the debtor or lender, etc. For post-1991 foreclosed property, these claims shall be recorded at their net present value at the time of foreclosure. The discount rate applied shall be the same rate that applies to the related foreclosed property. For post-1991 foreclosed property, any periodic changes in the net present value of the claim shall be offset by a charge or a credit to "interest income" and the reestimate of "subsidy expense," as appropriate under the standards for direct loans and loan guarantees. For pre-1992 foreclosed property, these claims shall be recorded at the expected amount of the cash required to settle the claims.

RECEIPTS AND DISBURSEMENTS DURING THE HOLDING PERIOD FOR POST-1991 FORECLOSED PROPERTY. 88 Any receipts or disbursements associated with acquiring and holding post-1991 foreclosed property shall be charged or credited to foreclosed property. This shall include rental receipts, maintenance and repair expense, advertising costs, and any other elements of the projected cash flows considered in arriving at the net present value.

SALE OF FORECLOSED PROPERTY. 89 Upon sale, any difference between the net carrying amount of foreclosed

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

property and the net proceeds of the sale shall be recognized as a component of operating results. For post-1991 foreclosed property, interest income shall be accrued from the previous periodic adjustment in the carrying amount up to the sale date. The difference between the adjusted carrying amount and the net sales proceeds shall be recognized as a reestimate of "subsidy expense." For pre-1992 foreclosed property, this difference shall be recognized as a gain or a loss on the sale of foreclosed property.

ASSETS CONVERTED FROM HELD-FOR-SALE ASSETS TO OPERATING ASSETS. 90 Assets not sold but placed into operation shall be removed from foreclosed property when such action is taken. If reimbursement for the transfer of assets from one program to another is made, the proceeds from the transfer shall be treated in the same manner as a sale to a third-party.

Disclosure Requirements. 91

-- Valuation basis used for foreclosed property.

-- Changes from prior year's accounting methods, if any.

-- Restrictions on the use/disposal of the property.

-- Balances in the categories described above.

-- Number of properties held and average holding period by type or category.

-- Number of properties for which foreclosure proceedings are in process at the end of the period.

The provisions of this statement need not be applied to immaterial items.

****

The Accounting Standards -- GOODS HELD UNDER PRICE SUPPORT AND STABILIZATION PROGRAMS

GOODS HELD UNDER PRICE SUPPORT AND STABILIZATION PROGRAMS

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

DEFINITION. 92 Goods acquired under price support and stabilization programs are referred to as commodities. "Commodities" are items of commerce or trade having an exchange value. They are acquired, held, sold, or otherwise disposed of to satisfy or help satisfy economic goals.

93 In conducting price support operations, the money is frequently disbursed in the form of "nonrecourse loans." Recipients of such loans pledge specific farm commodities as collateral for the loans and have the alternatives of redeeming the loans (repaying them with interest) or surrendering the commodities in exchange for the outstanding loan balance.

94 Besides acquiring commodities through surrender of collateral for nonrecourse loans, an entity may acquire commodities by a purchase settlement. A purchase settlement is exercised on the basis of a purchase agreement between a producer and the Commodity Credit Corporation (CCC). On the basis of the agreement, a producer has the option to sell commodities to CCC and receive full payment for the commodity at the price support rate. The amount of the purchase settlement is calculated by multiplying the price support rate by the number of units purchased by the CCC. Support price rates are set by law.

95 Because nonrecourse loans and purchase agreements are closely associated with the acquisition of the actual commodities, the three components of the price support program are addressed in this accounting standard.

RECOGNITION. 96 Nonrecourse loans shall be recognized as assets when the loan principal is disbursed. These loans shall be recorded at the amount of the loan principal. Interest income shall be recognized as it is earned and an interest receivable established.

97 Purchase agreement settlements are executed at the option of the producer (seller). This creates an uncertainty regarding losses to be incurred by the purchaser. At financial statement dates a loss shall be recognized if information indicates that it is probable that a loss has been incurred on purchase agreements outstanding and the amount of the loss can be reasonably measured or estimated. The amount of the loss shall be estimated and may be based

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

on the contract price and the expected net realizable value of the commodities to be acquired.

98 If the contingent loss is not recognized because it is less than probable or it is not reasonably measurable, disclosure of the contingency shall be made if it is at least reasonably probable that a loss may occur.

99 Commodities shall be recognized as assets and reported on the face of the financial statements upon the producer's surrender of title to satisfy a nonrecourse loan or upon purchase by the agency.

100 Revenue shall be recognized upon the sale of commodities. At the time of sale, the carrying amount of the commodities sold shall be removed from commodities and reported as cost of goods sold.

101 The carrying amount of commodities held for other purposes shall be removed from the commodities asset account and reported as an expense upon transfer of the commodity.

VALUATION. 102 All nonrecourse loans shall be valued at the loan amount. Losses on nonrecourse loans shall be recognized when it is more likely than not that the loans will not be totally collected. The phrase "more likely than not" means more than a 50 percent chance of loss occurrence. The loan amount shall be preserved in the asset account as the gross value of the loan. When the loss is recognized, a valuation allowance, "allowance for losses", (a contra-asset) shall be established to reduce the gross value to its expected net realizable value. The allowance shall be reestimated on each financial reporting date.

103 The liability for losses on purchase agreements shall be valued at the net of the contract price and the net realizable value of the commodities described in the purchase agreement.

104 At the time of acquisition and for financial statement purposes, all commodities shall be valued at the lower of cost or net realizable value.

105 The cost for commodities acquired via a nonrecourse loan settlement is the amount of the loan principal (excluding interest), processing and packaging

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

costs incurred after acquisition, plus other costs (e.g., transportation) incurred in taking title to the commodity.

106 The cost for commodities acquired via a purchase settlement is the unit price agreed upon in the purchase agreement multiplied by the number of units purchased by CCC plus other costs (e.g., transportation) incurred in taking title to the commodity.

107 For financial statement purposes, any adjustments necessary to reduce the carrying amount of commodities to the lower of cost or net realizable value shall be recognized as a loss on farm price support and reported in the current period. The adjustment to the carrying amount shall be recorded in a commodity valuation allowance. Recoveries of losses may be recognized up to the point of any previously recognized losses on the commodities, and the commodity valuation allowance reduced accordingly in the current period.

108 For cost determination, any of the following cost flow assumptions may be applied in arriving at inventory balances and cost of goods sold or transferred: first-in, first-out (FIFO); weighted average; moving average; and specific identification.

Disclosure Requirements. 109

-- Basis for valuing commodities;including the valuation method and any cost flow assumptions.

-- Changes from prior year's accounting methods, if any.

-- Restrictions on the use, disposal, or sale of commodities.

-- An analysis of change in the dollar value and volume of commodities, including those (1) on hand at the beginning of the year, (2) acquired during the year, (3) disposed of during the year by method of disposition, (4) on hand at the end of the year, (5) on hand at year's end and estimated to be donated or transferred during the coming period, and (6) that may be received as a result of surrender of collateral related to nonrecourse

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

loans outstanding. The analysis should also show the dollar value and volume of purchase agreement commitments.

The provisions of this statement need not be applied to immaterial items.

****

APPENDIX A: Basis of the Board's Conclusions

110 This Appendix discusses the substantive comments that the Board received from respondents to the Exposure Draft, Accounting for Inventory and Related Property, issued in January 1993. The Appendix explains the Board's conclusions on issues raised by the respondents. A separate section is identified for each of the six recommended standards.

INVENTORY

111 Several respondents questioned the need for the various inventory categories proposed; inventory held in reserve for future sale; and excess, obsolete and unserviceable inventory. Respondents and speakers stated that (1) the requirement to segregate inventory and inventory held in reserve for future sale could result in arbitrary and subjective balance sheet allocations, (2) the category for excess, obsolete and unserviceable is unnecessary and (3) it is not cost-effective to modify systems to capture this data. However, other respondents supported the categories and indicated that they would result in more meaningful information.

112 Based on the comment letters received and the presentations at the public hearing, the objections seemed to be based on the belief that the Board intended to develop rigid guidelines for the categorization of inventory. However, it is apparent that these or similar categories are used internally by organizations. The Board is merely attempting to improve disclosure related to these categories. The Board concluded that the four categories should be maintained. The same issue was raised with regard to operating materials and supplies and the same conclusion was reached.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

113 Several respondents opposed identifying the holding costs associated with inventory held in reserve for future sale. They indicated that the information has no apparent utility value, that it was virtually impossible to compute and maintain incremental holding costs for the reserve, and that disclosure would not provide managers with useful information to make relevant decisions. They also indicated that this requirement would be too subjective and difficult to audit. The Board discussed this issue and concluded that the identification of holding cost was a broad issue and deserving of more detailed treatment than could be afforded in the inventory standard. The Board agreed to drop the disclosure requirement and to defer this issue until a later project on cost issues. The same issue was raised with regard to operating materials and supplies and the same conclusion was reached.

114 In the exposure draft, the Board requested opinions on two presentation formats for cost of goods sold and the change in the allowance for holding gains and losses under latest acquisition cost (LAC) (Par. 87). The following two cost of goods sold computations under the latest acquisition cost method where presented:

****

Proposed presentation: (Appendix A)	Alternative presentation: (Appendix B)
Cost of Goods Sold:	Cost of Goods Sold:
Beginning Inventory at LAC	Beginning Inventory at LAC
	LESS: Allowance
ADD: Purchases	ADD: Purchases
EQUALS: Cost of Goods Available for Sale	EQUALS: Cost of Goods Available for Sale
LESS: Ending Inventory at LAC	LESS: Ending Inventory at LAC less Allowance
EQUALS: Cost of Goods Sold	EQUALS: Cost of Goods Sold
Nonoperating Change (Change in the Allowance for Unrealized Holding Gain/Loss on Inventory)	

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

115 Most respondents to the question regarding the two alternative cost of goods sold computations indicated a preference for the alternative presentation from Appendix B. These respondents stated that changes in cost were "operating" in nature and should be included in the operating results. It was also noted that comparability would be improved under the alternative treatment since cost of goods sold would approximate historical cost. Two respondents provided examples of the "distortion of cost of goods sold" that may result under the proposed presentation. The examples showed that cost of goods sold as calculated under the first proposed treatment (Appendix A of the ED) might actually be less than it would have been under historical cost.

116 In reviewing the responses, it was noted that the "nonoperating change" seems to have been confused by some respondents with the "unrealized holding gain/loss" for the period. The full title, "Nonoperating Change - Change in the Balance of the Allowance for Unrealized Holding Gains/Losses" is, although cumbersome, more descriptive. The change in the balance is made up of decreases, due to liquidation of inventory or cost decreases, and increases, due to holding more inventory or cost increases. The net change should not be confused with the "unrealized holding gain/loss" for the period.

117 The Board, after much discussion, decided to adopt the alternative presentation (Appendix B of the ED). This would avoid (1) confusion as to the significance of the "nonoperating change" and (2) distortion of the cost of goods sold. In addition, for those wish to know the change in the allowance account, the Board decided that line items should be included in the calculation of the cost of goods sold to show the beginning and ending balances.

118 Some respondents believed that the Board should adopt the lower of cost or market (LCM) rule (traditional under Accounting Research Bulletin (ARB) 43) for valuing inventory. Respondents supporting the LCM rule stated that:

-- it provides a basis for measuring the utility of inventory, and

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

-- the operating performance financial reporting objective seems to require that matching or assigning revenues and expenses to the appropriate period be a primary concern.

119 In evaluating the LCM rule the Board considered some of the unique facets of the Federal environment:

-- pricing is often based on full cost recovery regardless of changes in market pricing, and

-- managers are often required to stock inventory based on legislative or mission concerns that are not driven by profit maximization (therefore, cost fluctuations are not as relevant to performance measurement).

120 The Board concluded that there was no need to include the LCM rule in the inventory standards.

121 The Board requested comments on the impact of historical cost accounting on performance measurement, and the costs and benefits of market value accounting. The majority of respondents that addressed these questions expressed a preference for historical cost accounting due to its verifiability and understandability. They also believed that market value methods were too costly to implement and subjective. Another said that for most government operations, the goal is cost recovery and market value has little relevance.

122 One Board member believes that market value information is more relevant to decision makers than historical cost information. This opinion is shared by many in the academic community. However, the Board devoted considerable resources to the issue of measuring and reporting on holding gains and losses, an essential component of market value accounting, and was unable to resolve the issues that arose in a manner that would have been cost-effective. The Board has decided to rely primarily on historical cost accounting for inventory.

123 The Board also requested comments on the standard cost using replacement cost method. The method was described in detail in Appendix C to the exposure draft. "Standard

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

costs" are defined as predetermined or budgeted per-unit costs. Standard costs are commonly used in manufacturing concerns and are being adopted in service industries as well.

124 In a standard cost system, variances between the actual per-unit cost and the standard per-unit rate are identified. Variances are typically calculated for the individual cost components, such as materials or labor, included in the overall per-unit rate.

125 Standard costs also provide managers useful information for managing inventory costs. As an agency purchases inventory during the year and incurs operating costs, the actual costs are compared with the standard costs to identify why the cost variances occurred. Since inventory and operating managers are evaluated against the standard, the managers have an incentive to meet the standard, which, in turn, provides for effective inventory cost control.

126 The distinction between the traditional standard cost system and that outlined in the exposure draft relates to replacement cost information. The method on which comments were requested would require standard costs based on the next period's expected replacement costs and overhead rates. Further, no adjustment to historical cost amounts would have been required for external reporting purposes.

127 The majority of the respondents cited substantially the same problems for this method as they cited for market value accounting in general. The calculations were viewed as complex, costly and subjective.

128 One Board member is concerned that this method would be excluded under the recommended standard. The Board does not believe that this is true. Standard cost systems, including replacement cost, are used internally in private industry to generate valuable management information. Standard cost information is then revised to approximate costs under historical cost bases because it is generally accepted accounting practices for financial reporting purposes. Therefore, a managerial costing system employing standards or replacement cost information that improves management's decision making could be entirely consistent with the standard so long as externally reported information approximates historical cost. Further, the Board expects to

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

take up the issue of costing systems in a future project on cost measurement.

129 With regard to inventory held in reserve for future sale, one respondent indicated that the phrase "either reported or disclosed" (par. 39) implies off-balance sheet reporting. The respondent believes that this category should be reported on the balance sheet rather than disclosed. The Board concluded that the decision as to the level of detail shown on the balance sheet should be left to preparers and/or auditors. While the Board did not revise the standard to require reporting on the face of the financials, the language describing the reporting and disclosure options was clarified.

130 One respondent suggested that the standard be revised so that excess, obsolete and unserviceable inventory would be valued at the lower of cost or net realizable value rather than at net realizable value. The respondent indicated that any gains on excess, obsolete or unserviceable inventory due to valuation at net realizable value should be recognized only upon disposal of such inventory and not when identified as such or upon periodic revaluations. Private sector GAAP, per ARB 43, requires that losses be recognized prior to disposal of inventory but that gains not be recognized until realized. This one-sided treatment has been criticized over the years but has survived based on the principle of conservatism that has prevailed.

131 Since the Federal government does not operate in a "for-profit" environment and does not seek financing from investors who rely on audited financial statements to make decisions, the conservative position taken in the past is not as relevant. However, the Board concluded that no change to the standard was required.

132 Some respondents commented on the absence of the last-in, first-out cost flow (LIFO) method under acceptable cost flow assumptions; stating that LIFO should be included as an acceptable option under historical cost since it tends to match current costs with current revenues. The Board did not include LIFO as an acceptable cost flow assumption due to the stale inventory values reported on the balance sheet as a result. However, the Board did permit use of any method that reasonably approximates historical cost under one of

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

the acceptable cost flow assumptions. Therefore, LIFO could be acceptable for an entity whose inventory turns over rapidly since there may be little difference between LIFO and any other cost flow assumption.

133 One respondent requested that the standard specifically address goods: a) held on consignment, b) acquired through barter, c) donated, d) that must be maintained by statute but have no market value, or e) that will not be sold or consumed but which must be held (e.g., weights and measures). The Board concluded that goods held on consignment were not within the scope of this standard. Goods maintained by statute but having no market value, and goods that will not be sold or consumed but must be held would presumably be categorized as stockpile materials and therefore no change to the standards was warranted. The Board did decide that valuation of goods acquired through barter or donated should be addressed under the inventory, operating materials and supplies, and stockpile materials standards.

OPERATING MATERIALS AND SUPPLIES

134 Respondents suggested that if a valuation method such as latest acquisition cost (LAC) is acceptable for inventory it should also be acceptable for operating materials and supplies. The Board agreed with this proposal since LAC approximates historical cost. Further, the Board believes that any method that approximates historical cost should be acceptable. The standard was revised accordingly.

STOCKPILE MATERIALS

135 Respondents indicated that the definition of stockpile materials would encompass routinely held reserves as well as major stockpiles of materials. It was the Board's intention to include only those items specifically identified by law as being "stockpiled." Items routinely used but held in unusually large quantities would not be included in this category but would remain components of inventory or operating materials and supplies; possibly categorized as held in reserve for future sale or use.

136 In addition, one respondent identified helium reserves as being mandated by law for "conservation" purposes. The Board concluded that it would be consistent to

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

include these reserves in stockpile materials. The definition has been clarified to limit stockpile materials to items held in order to comply with legal requirements established for purposes of defense, emergency or conservation.

137 As was the case for operating materials and supplies, respondents indicated that use of LAC would be appropriate for stockpile materials. The Board reached the same conclusion for this standard; that any method that approximates historical cost should be acceptable. The standard was revised accordingly.

138 One respondent suggested that an exception to permit market valuation for items that are interchangeable, have a ready market, and for which the unit cost is not determinable be added to the standard. The inventory standard provides this exception and the respondent suggested that it be available for stockpile material so that items such as strategic petroleum reserves could be valued at market value. The Board concluded that since these items are not routinely sold in large quantities the recognition of holding gains/losses may have an adverse impact on measurement of operating performance. Therefore, the exception was not added to the standard for stockpile materials.

SEIZED AND FORFEITED ASSETS

139 A respondent explained at the public hearing that a good portion of the forfeited assets are seized and valued under conditions which make accurate appraisals extremely difficult. As a result, there have been values reported for assets well in excess of what is eventually realized. The determination of the market value prior to the actual sale of the item is very difficult. The respondent has found that when the best estimate of market value is made on an item by item basis, the total value is still found to be overstated.

140 To avoid overstating deferred revenue, the respondent recommended that a valuation allowance be created to adjust the reported value of assets in the financial statements. The valuation allowance would be based on historical trends or other relevant information; in a manner similar to that used to establish an allowance for uncollectible receivables. For example, information over the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

last six months may show sale proceeds were 5% to 10% less than appraised values. Further, the respondent believes that use of the valuation allowance would recognize the inherent difficulties in estimating market values and would present better financial information.

141 Although the proposal is not without merit, it may be an unnecessary exercise. Market value is an estimate of the amount to be realized upon disposal of the property and should take into account the marketplace in which the property is expected to be disposed of (e.g., auction, fire sale, retail or wholesale markets, etc.). The use of valuation allowances against any asset category is not prohibited, however, the Board does not believe it necessary to require the use of a valuation allowance in this circumstance.

142 One respondent requested that the standard require that, in addition to recording deferred revenue, deferred distributions be recorded. A respondent at the public hearing explained that historically as much as 50% of the forfeited property is eventually distributed to federal, state, and local law enforcement entities which participated in the case. It was further explained that once property has been forfeited, a participating state, local, or federal agency may have already applied to receive that asset because of its participation in the case. Therefore, the recording of deferred revenue could be accompanied, where appropriate, by the recording of an estimate of deferred distributions. The intent of this is to avoid reporting misleading information in the financial statements.

143 The deferred distribution would represent another level of estimates related to forfeited property. In discussions with representatives from other agencies that handle seized and forfeited property, the Board has been told that no reasonable estimate of deferred distributions was available.

144 In addition to the difficulty in estimating distributions, the Board notes that there is no legal requirement to make a specific distribution until an application has been approved. This is similar in a sense to dividends declared by for-profit enterprises. There is no legal obligation to make a payment until the actual declaration by the Board of Directors; and the entity does

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

not record dividends payable until that time. Therefore, the Board has not revised the standard as suggested. However, the Board has added a disclosure requirement for any reasonable estimate of future distributions.

145 The comment letters also included proposals for miscellaneous changes to this standard:

1) In that the government does not have ownership, seized monetary instruments should be disclosed rather than reported on the face of the financials.

2) Seized property other than monetary instruments should be reported as assets, like monetary instruments, with a liability for possible remittance of equal value recorded.

3) For non-monetary forfeited assets the disclosure requirements are adequate to ensure information is available to users. Therefore, non-monetary forfeited assets should not be reported on the face of the financial statements.

4) At the time that forfeiture judgement is obtained, ownership of the property is effectively transferred to the federal agency and the government should recognize the revenue earned at that time rather than deferring it.

146 The first two suggestions relate to seized property. The Board considered these suggestions during its discussions of seized property. The Board did not revise the standard; this was based on (1) the desire to establish strong controls over monetary instruments and (2) the difficulties in valuing and uncertainties regarding disposition associated with seized non-monetary property.

147 The third and fourth items relate to forfeited property. The suggestion to disclose forfeited non-monetary instruments, item 3, would result in understatement of the entity's assets. Disclosure requirements should emphasize that the value reported is merely an "estimate" of the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

property's value. The suggestion to recognize revenue upon forfeiture, item 4, while theoretically correct was not adopted by the Board. Due to the difficulties in valuing forfeited property and the risk of overstating the revenue the Board decided to defer revenue recognition until the property was sold.

148 One respondent requested that the standard address valuation of property for which there is no value, which cannot be legally sold, but which can be donated to museums or other non-profit organizations (e.g., stuffed endangered species) or destroyed (e.g., narcotics). The standard was revised to clarify the disclosure requirements and to indicate that no financial value need be reported for these items. Entities are not prohibited from reporting information regarding the dollar value of illegal assets seized if they so chose. The standard only relates to financial recognition and disclosure.

149 One respondent indicated that the analysis of change in seizures disclosure requirement is very detailed and should not be required for agencies with only incidental seizure activity. The Board has indicated that the standard is not intended to be applied to immaterial items.

150 One respondent noted that the definitions of seized and forfeited property seem to be limited to monetary instruments, real property and tangible personal property. The respondent asked that this definition be extended to intangible assets (e.g., savings and loan charters). The Board did broaden the definition to address intangible property.

151 One respondent explained that the exposure draft can be interpreted to advise agencies to account for the assets through the seizing agency's property records and financial statements. However, in most cases, the seizing agency is different from the custodial agency which may take possession of seized property. In addition, there may be a central fund created to support activities of multiple agencies. It was recommended that the standard be modified to recognize the distinction between "seizing agencies" and "custodial agencies." A "central fund" would be responsible for accounting and reporting for the assets of the asset forfeiture fund.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

152 The exposure draft had defined "seized property" as being "in the actual or constructive possession of the seizing agency." The respondent has correctly pointed out that this is not always the case since custodial agencies frequently take possession and/or responsibility for seized property. Depending on the circumstances, each party may have a need to maintain property records regarding seized property. For example, a seizing agency may wish to track property that may be ultimately distributed to it. In addition, seizing agencies may maintain physical possession of the property during the forfeiture process. The Board has modified the definition to include seized property held by custodial agencies.

153 With regard to the request for a clear statement of which agency is to maintain records on seized property, the Board believes that seizing agencies may have a need for property records related to seized property and does not wish to preclude them from doing so. However, in preparing consolidated financial statements care should be taken to avoid double counting these items. With regard to forfeited property, ownership should be the determinant for an entity's recognition of an asset. However, an agency that maintains physical custody, but not ownership, of forfeited property is not precluded from maintaining property records although no asset should be recognized.

FORECLOSED PROPERTY

154 Many respondents objected to the requirement to value post-1991 foreclosed property at net present value (NPV). The primary objections to the use of NPV were:

-- NPV is not a more accurate valuation basis than net realizable value (NRV)

-- NPV does not improve the information presented

-- Difference between NPV and NRV is immaterial

-- Loss of comparability with commercial enterprises

-- Maintenance of two systems to value foreclosed property (pre-1992 and post-1991)

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

is costly and unnecessary

-- Changes in existing systems would be complicated and expensive

-- Cash flows may not be forecast with sufficient accuracy to measure NPV

155 In proposing present value accounting, the Board's primary considerations were to carry out the intent of the Federal Credit Reform Act of 1990 (the Act) and to make financial reporting compatible with the budget. Since foreclosed property is a result of the original loan transaction or loan guarantee, reporting on this activity should be guided by the provisions of the Act.

156 An extensive discussion of the Board's overall decision to require present value accounting is presented in Recommended Accounting Standard No. 2, "Accounting for Direct Loans and Loan Guarantees" (see Appendix A). One of the objectives of financial reporting is to enable the reader to determine the status of budgetary resources, and whether those resources were acquired and used in accordance with the enacted budget. The Board believes that only by using the same basis can financial information be used to compare the actual results of operations with the budget.

157 However, the Board wishes to acknowledge that respondents may be correct in stating that in certain cases there may be only immaterial differences between net realizable value (or other methods) and NPV. The standard has been revised to indicate that if no material difference results, other valuation methods may be used for foreclosed property.

158 One respondent currently values foreclosed vessels at their acquisition price based on its own bid at the foreclosure sale. Following acquisition, the value is depreciated at one-percent per month. Gains or losses are recognized upon sale. The respondent believes that the current practice is more appropriate because: (1) the price paid at foreclosure sale represents the best valuation, (2) estimating future net cash flows requires assumptions and this would be less prudent than utilizing existing specific valuations, and (3) the entity has had to establish the value of the vessels in legal proceedings and has relied on

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

the acquisition price to do so - utilizing a different value in financial records could jeopardize the entity's position in legal proceedings. The Board has not revised the standard as a result of this request. The Board believes that there are no unique circumstances in this case which would preclude conformance to the standard.

GOODS HELD UNDER PRICE SUPPORT AND STABILIZATION PROGRAMS

159 The proposed standard required that nonrecourse loans be adjusted at time of disbursement to recognize a loss if the market rate is lower than the loan rate. This constituted a departure from current practice that is to adjust the loan values to their expected net realizable value at report date. Respondents expressed concern that the proposed method would result in recognizing losses without consideration of the underlying economic transaction (i.e., will the loans be repaid).

160 Based on two respondents' comments, the Board found that the approach originally proposed ignored the "probability" component in recognizing unrealized losses; these losses have typically been recognized only if they are "probable and measurable. Nonrecourse loans, being short-lived, are similar in nature to notes or accounts receivable. Therefore, the Board referred to its recommended standard for accounts receivable. That standard states that:

> Losses on receivables should be recognized when it is more likely than not that the receivables will not be totally collected. The phrase "more likely than not" means more than a 50 percent chance of loss occurrence.
>
> An allowance for estimated uncollectible amounts should be recognized to reduce the gross amount of receivables to its net realizable value. The allowance for uncollectible amounts should be reestimated on each financial reporting date and when information indicates that the latest estimate is no longer correct. (FASAB, Recommended Accounting Standard 1, Paragraphs 44 and 45)

161 In addition, one respondent indicated that the originally proposed standard would have excluded loss recognition due to factors other than fluctuations in the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

market rates. Losses can occur due to (1) farmers' misuse or handling of the pledged commodities, or (2) fraud. Clearly the concept of loss recognition should be broadened in order to recognize these events. The Board modified the standard for nonrecourse loans to be more consistent with the accounts receivable standard and to encompass the Board's current thinking on the liability project.

162 One respondent argued that purchase agreements constitute a contingent liability. The proposed standard would require recognizing a liability and a loss if the contract price exceeded the expected net realizable value of the commodities. It is clear that at any given time the market price may be lower than the contract price but that due to cycles in the harvest and post-harvest market this may not be an indication that the contract will be executed and a loss realized. The Board revised the standard to provide for loss recognition in connection with purchase agreements if the loss is both probable and measurable.

****

GLOSSARY

This glossary provides definitions for many terms used in this Statement. The definitions may be modified or superseded when relevant terms are considered or defined by the Board in future projects.

CENTRAL FUND: An entity created to support the seizure activities of multiple law enforcement agencies.

COLLATERAL: Real or personal property pledged as part or full security on a debt. ("Kohler's Dictionary for Accountants," W. W. Cooper and Yuji Ijiri, Prentice Hall, Inc., New Jersey, 1983)

CONSUMPTION METHOD: A method of accounting for goods, such as materials and supplies, where the goods are recognized as assets upon acquisition and are expensed as they are consumed.

CONTRA COUNT: One of two or more accounts which partially or wholly offset another or other accounts; on financial statements, they may be either merged or appear together. ("Kohler's Dictionary for Accountants")

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

COST-BENEFIT ANALYSIS: The weighing of benefits against costs usually expressed as a ratio of dollar benefits to dollar costs for each of a variety of alternatives to provide a comparable basis of choice among them. ("Kohler's Dictionary for Accountants")

DEFAULT: The failure to meet any obligation or term of a credit agreement, grant, or contract. Often used to refer to accounts more than 90 days delinquent. (Treasury Financial Manual Supplement)

DIRECT LOAN: A disbursement of funds by the government to a nonfederal borrower under a contract that requires the repayment of such funds within a certain time with or without interest. The term includes the purchase of, or participation in, a loan made by another lender. (Adapted from OMB Circular No. A-11, 33.5 (d))

DISCLOSURE: An explanation, or exhibit, attached to a financial statement, or embodied in a report (e.g., an auditor's) containing a fact, opinion, or detail required or helpful in the interpretation of the statement or report; an expanded heading or a footnote. ("Kohler's Dictionary for Accountants")

DISCOUNT: The difference between the estimated worth of a future benefit and its present value; a compensation for waiting or an allowance for returns from using the present value of these returns in other ways. ("Kohler's Dictionary for Accountants")

DISCOUNT RATE: An interest rate that is used in present value calculations to equate amounts that will be received or paid in the future to their present value.

END USER: Any component of a reporting entity that obtains goods for direct use in its normal operations. The component may also be a contractor.

FIRST-IN, FIRST-OUT (FIFO): A cost flow assumption; the first goods purchased or produced are assumed to be the first goods sold.

FORECLOSURE: A method of enforcing payment of a debt secured by a mortgage by seizing the mortgaged property.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

Foreclosure terminates all rights that the mortgagor has in the mortgaged property upon completion of due process through the courts. ("Treasury Financial Manual Supplement")

INTEREST RATE: The price charged per unit of money borrowed per year, or other unit of time, usually expressed as a percentage. ("Kohler's Dictionary for Accountants")

LAST-IN, FIRST-OUT (LIFO): A cost flow assumption; the last goods purchased are assumed to be the first goods sold.

LATEST ACQUISITION COST: Includes all amounts, except interest, paid to a vendor to acquire an item.

LOAN GUARANTEE: Any guarantee, insurance, or other pledge with respect to the payment of all or part of the principal or interest on any debt obligation of a nonfederal borrower to a nonfederal lender but does not include the insurance of deposits, shares, or other withdrawable accounts in financial institutions. (OMB Circular A-11, 33.5 (g))

LOSS: Any expense or irrecoverable cost, often referred to as a form of nonrecurring charge, an expenditure from which no present or future benefit may be expected. ("Kohler's Dictionary for Accountants")

LOWER OF COST OR MARKET: A valuation rule that recognizes impairment of asset values but avoids anticipated gains. The rule is typically applied to individual items or groups of like items, such as inventory or marketable securities. In this rule, "cost" refers to historical cost and "market" refers to the current replacement cost by purchase or production. ("Kohler's Dictionary for Accountants")

MARKET VALUE: The estimated amount that can be realized by disposing of an item through arm's length transactions in the marketplace; the price (usually representative) at which bona fide sales have been consummated for products of like kind, quality, and quantity in a particular market at any moment of time. For investments in marketable securities, the term refers to the market price of a security times the number of shares of that security held.

MOVING AVERAGE: An inventory costing method used in conjunction with a perpetual inventory system. A weighted average cost per unit is recomputed after every purchase.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

Goods sold are costed at the most recent moving average cost.

NET REALIZABLE VALUE: The estimated amount that can be recovered from selling, or any other method of disposing of an item less estimated costs of completion, holding and disposal. ("Kohler's Dictionary for Accountants")

PURCHASES METHOD: A method of accounting for goods, such as materials and supplies, in which the acquisition cost is recognized as an expense upon purchase of the goods rather than upon their use.

PRESENT VALUE: The value now of a future sum or sums discounted assuming compound interest. (Kieso and Weygandt, Intermediate Accounting, 7th ed., p. 264)

RECOGNIZE: To determine the amount, timing, classification, and other conditions precedent to the acceptance and entry of a transaction. Hence, to give expression on the books of account; said of transactions. ("Kohler's Dictionary for Accountants")

RECORD: To give expression to a transaction on (or in) the books of account; to enter. ("Kohler's Dictionary for Accountants")

REPAIRABLE: An inventory item that is expected to be repaired when broken or worn out.

REPLACEMENT COST: The cost to reproduce an inventory item by purchase or manufacture. In lower of cost or market computations, the term "market" means replacement cost, subject to ceiling and floor limitations.

SELLING EXPENSE (COST): Expenses incurred in selling or marketing, e.g., salaries, commissions, and promotion expenses. ("Kohler's Dictionary for Accountants")

SPECIFIC IDENTIFICATION: An inventory system in which the seller identifies which specific items are sold and which remain in ending inventory.

STANDARD COSTS: Predetermined expected unit costs, which are acceptable for financial reporting purposes if adjusted periodically to reflect actual results.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_3.pdf.

TITLE: The right to property; the means by which such right is established. ("Kohler's Dictionary for Accountants")

VALUATION (OR ACCOUNTING VALUATION): Valuation methods and bases are numerous and varied; and may be expressed quantitatively and in monetary terms. Application may be made to a single asset, a group of assets, or an entire enterprise, as determined by various bases and methods. ("Kohler's Dictionary for Accountants")

VALUATION ACCOUNT (ALLOWANCE OR RESERVE): An account that partly or wholly offsets one or more other accounts; for example, accumulated depreciation is a valuation account related to specific depreciable assets and allowance for bad debts is a valuation account related to accounts receivable. If a valuation account is deducted from the related asset or liability it is sometimes referred to as a contra-asset or contra-liability account. ("Kohler's Dictionary for Accountants")

VARIANCE: The difference for a year or less between the elements (direct material, direct labor, factory overhead) of standard cost and actual cost. The term applies to (a) a money difference or (b) changes in the character or purpose of amounts expended. ("Kohler's Dictionary for Accountants")

WEIGHTED-AVERAGE: A periodic inventory costing method where ending inventory and cost of goods sold are priced at the weighted-average cost of all items available for sale.

WRITE-OFF: An action to remove an amount from an entity's assets or financial resources. A write-off of a loan occurs when an agency official determines, after all appropriate collection tools have been used, that a debt is uncollectible. Active collection on an account ceases, and the account is removed from an entity's receivables. ("Treasury Financial Manual Supplement").

Costing Methodology (paragraphs 116-162)

APPENDIX A: Basis for Conclusions (paragraphs 163-270)

APPENDIX B: Glossary

****

EXECUTIVE SUMMARY

1. The managerial cost accounting concepts and standards contained in this statement are aimed at providing reliable and timely information on the full cost of federal programs, their activities, and outputs. The cost information can be used by the Congress and federal executives in making decisions about allocating federal resources, authorizing and modifying programs, and evaluating program performance. The cost information can also be used by program managers in making managerial decisions to improve operating economy and efficiency.

2. The concepts of managerial cost accounting contained in this statement describe the relationship among cost accounting, financial reporting, and budgeting. The five standards set forth the fundamental elements of managerial cost accounting: (1) accumulating and reporting costs of activities on a regular basis for management information purposes, (2) establishing responsibility segments to match costs with outputs, (3) determining full costs of government goods and services, (4) recognizing the costs of goods and services provided among federal

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

entities, and (5) using appropriate costing methodologies to accumulate and assign costs to outputs.

3. These standards are based on sound cost accounting concepts and are broad enough to allow maximum flexibility for agency managers to develop costing methods that are best suited to their operational environment. Also, the managerial cost accounting standards and practices will evolve and improve as agencies gain experience in using them. The following is a summary of the concepts and standards contained in this statement:

Managerial Cost Accounting Concepts

4. Managerial cost accounting should be a fundamental part of the financial management system and, to the extent practicable, should be integrated with other parts of the system. Managerial costing should use a basis of accounting, recognition, and measurement appropriate for the intended purpose. Cost information developed for different purposes should be drawn from a common data source, and output reports should be reconcilable to each other.

Managerial Cost Accounting Standards

Requirement for cost accounting

5. Each reporting entity should accumulate and report the costs of its activities on a regular basis for management information purposes. Costs may be accumulated either through the use of cost accounting systems or through the use of cost finding techniques.

Responsibility segments

6. Management of each reporting entity should define and establish responsibility segments. Managerial cost accounting should

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

be performed to measure and report the costs of each segment's outputs. Special cost studies, if necessary, should be performed to determine the costs of outputs.

Full cost

7. Reporting entities should report the full costs of outputs in general purpose financial reports. The full cost of an output produced by a responsibility segment is the sum of (1) the costs of resources consumed by the segment that directly or indirectly contribute to the output, and (2) the costs of identifiable supporting services provided by other responsibility segments within the reporting entity, and by other reporting entities.

Inter-entity costs

8. Each entity's full cost should incorporate the full cost of goods and services that it receives from other entities. The entity providing the goods or services has the responsibility to provide the receiving entity with information on the full cost of such goods or services either through billing or other advice.

9. Recognition of inter-entity costs that are not fully reimbursed is limited to material items that (1) are significant to the receiving entity, (2) form an integral or necessary part of the receiving entity's output, and (3) can be identified or matched to the receiving entity with reasonable precision. Broad and general support services provided by an entity to all or most other entities generally should not be recognized unless such services form a vital and integral part of the operations or output of the receiving entity.

Costing methodology

10. Costs of resources consumed by

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

responsibility segments should be accumulated by type of resource. Outputs produced by responsibility segments should be accumulated and, if practicable, measured in units. The full costs of resources that directly or indirectly contribute to the production of outputs should be assigned to outputs through costing methodologies or cost finding techniques that are most appropriate to the segment's operating environment and should be followed consistently.

11. The cost assignments should be performed using the following methods listed in the order of preference: (a) directly tracing costs wherever feasible and economically practicable, (b) assigning costs on a cause-and-effect basis, or (c) allocating costs on a reasonable and consistent basis.

12. These accounting standards need not be applied to items that are qualitatively and quantitatively immaterial. The Board recommends that the managerial accounting standards of this Statement become effective for fiscal periods beginning after September 30, 1996. Earlier implementation is encouraged.

****

INTRODUCTION

Background

13. Reliable information on the costs of federal programs and activities is crucial for effective management of government operations. In Statement of Federal Financial Accounting Concepts (SFFAC) No. 1, Objectives of Federal Financial Reporting, issued in 1993, it is stated that the objectives of federal financial reporting are to provide useful information to assist internal and external users in assessing the budget integrity, operating performance, stewardship, and systems and control

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

of the federal government.[Footnote 1]

[Footnote 1: Statement of Federal Financial Accounting Concepts No. 1, "Objectives of Federal Financial Reporting" (September 2, 1993), pars. 110 and 111, pages 34-35.]

14. Managerial cost accounting is especially important for fulfilling the objective of assessing operating performance. In relation to that objective, it is stated in SFFAC No. 1 that federal financial reporting should provide information that helps users to determine:

-- Costs of specific programs and activities and the composition of, and changes in, those costs;

-- Efforts and accomplishments associated with federal programs and their changes over time and in relation to costs; and

-- Efficiency and effectiveness of the government's management of its assets and liabilities.[Footnote 2]

[Footnote 2: Ibid., pars. 126-130, pages 39-40.]

15. It is further stated in SFFAC No. 1 that "The topics of costs and performance measurement are related because it is by associating cost with activities or cost objectives that accounting can make much of its contribution to reporting on performance."[Footnote 3] "Cost" is the monetary value of resources used or sacrificed or liabilities incurred to achieve an objective, such as to acquire or produce a good or to perform an activity or service. Costs incurred may benefit current and future periods. In financial accounting and reporting, the costs that apply to an entity's operations for the current accounting period are recognized as expenses of that period.

[Footnote 3: Ibid., par. 192, page 63.]

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

16. The Chief Financial Officers Act of 1990 includes among the functions of chief financial officers "the development and reporting of cost information" and "the systematic measurement of performance."[Footnote 4] In July 1993, Congress passed the Government Performance and Results Act (GPRA) which mandates performance measurement by federal agencies.[Footnote 5] In September 1993, in his report to the President on the National Performance Review (NPR), Vice President Al Gore recommended an action which required the Federal Accounting Standards Advisory Board to issue a set of cost accounting standards for all federal activities.[Footnote 6] Those standards will provide a method for identifying the unit cost of all government activities.

[Footnote 4: 104 Stat. 2938 (See particularly 31 U.S.C. sec 902).]

[Footnote 5: 107 Stat. 285 (See particularly, 31 U.S.C. sections 1101, 1105, 1115, 1116-1119, 9703, 9704).]

[Footnote 6: Vice President Al Gore, "Creating A Government That Works Better & Costs Less," Accompanying Report of the National Performance Review (September 1993), p. 59.]

17. In early 1994, the Federal Accounting Standards Advisory Board (the Board) convened an advisory group to help develop standards for managerial cost accounting in the federal government. The group included members from government, business, and academe. Their views and proposals have been considered by the Board, and their work contributed greatly in developing this document.

Users of Federal Cost Information

18. The cost of government is a concern to the public as well as to the federal government itself. Most government service efforts and accomplishments cannot be measured in financial

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

terms alone. Unlike private business, there is no "bottom line" or profit index to help measure public sector performance. However, government service efforts and accomplishments can be evaluated using both financial and non-financial measures, and "cost" is an important financial measure for government programs. Internal and external federal information users identified below will find these standards helpful in assessing operating performance, stewardship, systems, and control of the federal government.

19. Government managers are the primary users of cost information. They are responsible for carrying out program objectives with resources entrusted to them. Reliable and timely cost information helps them ensure that resources are spent to achieve expected results and outputs, and alerts them to waste and inefficiency.

20. Congress and federal executives, including the President, make policy decisions on program priorities and allocate resources among programs. These officials need cost information to compare alternative courses of action and to make program authorization decisions by assessing costs and benefits. They also need cost information to evaluate program performance.

21. Citizens, including news media and interest groups, are concerned with the costs and results of federal programs that affect their interests. They need program cost information to judge whether resources are allocated to programs rationally and if the programs operate efficiently and effectively.

Objectives

22. The managerial cost accounting concepts and standards presented here are intended for all the user groups identified above. These standards are aimed at achieving three general objectives:

-- Provide program managers [Footnote 7] with relevant and reliable information relating

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

costs to outputs and activities. Based on this information, program managers can respond to inquiries about the costs of the activities they manage. The cost information will assist them in improving operational economy and efficiency;

[Footnote 7: Statement of Federal Financial Accounting Concepts No.1, "Objectives of Financial Reporting," defined "Program managers" as individuals who manage federal programs, and stated that "Their concerns include operating plans, program operations, and budget execution." SFFAC No. 1, par. 85, page 29.]

-- Provide relevant and reliable cost information to assist the Congress and executives in making decisions about allocating federal resources, authorizing and modifying programs, and evaluating program performance; and

-- Ensure consistency between costs reported in general purpose financial reports and costs reported to program managers. This includes standardizing terminology for managerial cost accounting to improve communication among federal organizations and users of cost information.

Scope of Standards

23. This statement contains managerial cost concepts and five standards for the federal government. The five standards address the following topics:

(1) Requirement for cost accounting,
(2) Responsibility segments,
(3) Full cost,
(4) Inter-entity costs, and
(5) Costing methodology.

The essence of each standard is briefly stated in a box followed by detailed explanations. However, both the words in the boxes and the entire text of

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

explanations constitute the requirements of the standards.

24. These standards are based on sound cost accounting concepts and allow sufficient flexibility for agencies to develop managerial cost accounting practices that are suited to their specific operating environments. Also, it is expected that cost accounting standards and practices will evolve and improve as agencies gain experience in using them.

25. Other Statements of Federal Financial Accounting Standards (SFFAS) address recognition and measurement of assets and liabilities. For additional guidance, readers should consult: SFFAS No. 1, Accounting for Selected Assets and Liabilities; SFFAS No. 2, Accounting for Direct Loans and Loan Guarantees; and SFFAS No. 3, Accounting for Inventory and Related Property. The Board is working on and will soon complete other recognition and measurement projects related to revenues, liabilities, property, plant, and equipment, and other elements of financial statements.[Footnote 8]

[Footnote 8: See FASAB Exposure Drafts, "Accounting for Liabilities of the Federal Government" (November 7, 1994); "Accounting for Property, Plant, and Equipment" (February 28, 1995); and "Revenue and Other Financing Sources" (Pending).]

Terminology

26. Managerial cost accounting information, to be useful, must rely on consistent and uniform terminology for concepts, practices, and techniques. Consistent and uniform use of terminology can help avoid confusion and mis-communication among organizations and individuals.

27. As a start toward developing consistent managerial cost accounting terminology within the federal government, this statement includes a glossary of basic cost accounting terms.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

Materiality

28. Except as otherwise noted, the accounting and reporting provisions of these accounting standards need not be applied to items that are qualitatively and quantitatively immaterial.

29. The determination of whether an item is material depends on the degree to which omitting information about the item makes it probable that the judgment of a reasonable person relying on the information would have been changed or influenced by the omission.

Effective Date

30. The Board recommends that the accounting standards of this Statement become effective for fiscal periods beginning after September 30, 1996. Earlier implementation is encouraged.

Purposes of Using Cost Information

31. There are many different purposes for which cost information may be used by the federal government. The focus of this statement is on cost information needed to improve federal financial management and managerial decision making.

32. In managing federal government programs, cost information is essential in the following five areas: (1) budgeting and cost control, (2) performance measurement, (3) determining reimbursements and setting fees and prices, (4) program evaluations, and (5) making economic choice decisions. Each of these uses is discussed below.

Budgeting and Cost Control

33. Information on the costs of program activities can be used as a basis to estimate future costs in

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

preparing and reviewing budgets. Once budgets are approved and executed, cost information serves as a feedback to budgets. Using cost information, federal managers can control and reduce costs, and find and avoid waste. For example, with appropriate cost information, federal managers can:

-- Compare costs with known or assumed benefits of activities, identify value-added and non-value-added activities, and make decisions to reduce resources devoted to activities that are not cost-effective;

-- Compare and determine reasons for variances between actual and budgeted costs of an activity or a product;

-- Compare cost changes over time and identify their causes;

-- Identify and reduce excess capacity costs; and

-- Compare costs of similar activities and find causes for cost differences, if any.

Performance Measurement

34. Measuring performance is a means of improving program efficiency, effectiveness, and program results. One of the stated purposes of the GPRA of 1993 is to ". . .improve the confidence of the American people in the capability of the federal government, by systematically holding federal agencies accountable for achieving program results."

35. Measuring costs is an integral part of measuring performance in terms of efficiency and cost-effectiveness. Efficiency is measured by relating outputs to inputs. It is often expressed by the cost per unit of output. While effectiveness in itself is measured by the outcome or the degree to which a predetermined objective is met, it is commonly combined with cost

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

information to show "cost-effectiveness." Thus, the service efforts and accomplishments of a government entity can be evaluated with the following measures:

(1) Measures of service efforts which include the costs of resources used to provide the services and non-financial measures;

(2) Measures of accomplishments which are outputs (the quantity of services provided) and outcomes (the results of those services); and

(3) Measures that relate efforts to accomplishments, Such as cost per unit of output or cost-effectiveness.

36. Thus, as stated previously, performance measurement requires both financial and non-financial measures. Cost is a necessary element for performance measurement, but is not the only element.

Determining Reimbursements and Setting Fees And Prices

37. Cost information is an important basis in setting fees and reimbursements. Pricing and costing, however, are two different concepts. Setting prices is a policy matter, sometimes governed by statutory provisions and regulations, and other times by managerial or public policies. Thus, the price of a good or service does not necessarily equal the cost of the good or the service determined under a particular set of principles. Nevertheless, cost is an important consideration in setting government prices. With certain exceptions, OMB requires: [Footnote 9]

[Footnote 9: OMB Circular A-25, User Charges (Revised July 8, 1993).]

-- With respect to goods and services that the government provides in its sovereign capacity to a particular group of individuals as a special benefit, user charges should be

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

sufficient to recover the full cost of those goods and services; and

-- With respect to goods and services that the government provides under business-like conditions, user charges for those goods and services need not be limited to the recovery of full cost and may yield a net revenue.

38. Also, cost information is important in calculating reimbursements for products and services provided by one government agency to another. Even if fees or reimbursements do not recover the full costs due to policy or economic constraints, management needs to be aware of the difference between cost and price. With this information, program managers can properly inform the public, the Congress, and federal executives about the costs of providing the goods or services.

Program Evaluations

39. Costs of federal resources required by programs are an important factor in making policy decisions related to program authorization, modification, and discontinuation. These decisions are usually subject to policy constraints, and often require the consideration of social and economic costs and benefits affecting different sectors of the economy and society. Nevertheless, the costs of federal resources required are an important factor. Information on program costs can be used as a basis for cost-benefit considerations.

Economic Choice Decisions

40. Often, agencies and programs face decisions involving choices among alternative actions, such as whether to do a project in-house or contract it out; to accept or reject a proposal; or to continue or drop a product or service. Making these decisions requires cost comparisons among available alternatives.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

Managerial Cost Accounting Concepts

Managerial cost accounting should be a fundamental part of the financial management system and, to the extent practicable, should be integrated with other parts of the system. Managerial costing should use a basis of accounting, recognition, and measurement appropriate for the intended purpose. Cost information developed for different purposes should be drawn from a common data source, and output reports should be reconcilable to each other.

41. Managerial cost accounting should be an essential element of proper financial planning, control, and evaluation for any organization or activity that uses resources having monetary value. Managerial cost accounting is a basic part of the financial management system in that it supports and provides data to the budgetary and financial accounting functions and, by itself, provides useful information for both internal and external users.

Role of Managerial Cost Accounting in Financial Management

42. Managerial cost accounting is the process of accumulating, measuring, analyzing, interpreting, and reporting cost information useful to both internal and external groups concerned with the way in which the organization uses, accounts for, safeguards, and controls its resources to meet its objectives. Managerial cost accounting, therefore, is the servant of both budgetary and financial accounting and reporting because it assists those systems in providing information. Also, it provides useful information directly to management. These relationships are shown in Figure 1.

Figure 1: Financial Management Information Framework

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

(Omitted, see hard copy)

Common Data Source

43. The information flow within a financial management system begins with a basic information pool or common data source. This data source consists of all financial and programmatic information used by the budgetary, cost, and financial accounting processes. It includes all financial and much non-financial data, such as environmental data, that are necessary for budgeting and financial reporting.[Footnote 10] The common data source also includes evaluation and decision information developed as a result of prior reporting and feedback. Other types of data may be included based upon perceived needs and purposes related to the ultimate users of the information.

[Footnote 10: The makeup of core data and environmental data is discussed in Statement of Federal Financial Accounting Concepts No. 1, "Objectives of Federal Financial Reporting," Chapter 7, and, therefore, a detailed discussion is not provided here.]

44. The common data source may include many different kinds of data. It is far more than the information about financial transactions found in the standard general ledger, although that is a significant part of the data source. Few organizations or entities maintain all these data in any one system or location. Furthermore, the use of the term "data source" is not meant to imply the use of computerized systems for source information. Instead, the term is used in a broad way to include many sources of information.

45. Managerial cost accounting, financial accounting, and budgetary accounting draw information as needed from the common data source. The data obtained by each of these is processed to attain specific objectives by reporting useful

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

information.

Relationship to Financial Accounting

46. As shown in Figure 1 by their overlap, managerial cost accounting and financial accounting are closely related or integrated. To some degree, this is due to the historical development of cost accounting as a method for more detailed scorekeeping with the requirement to provide inventory values for external financial reporting purposes.[Footnote 11] In part, it is because cost information generally originates with transactions recorded for financial accounting purposes.

[Footnote 11: Coulthurst, Nigel and John Piper, "The State of Cost and Management Accounting," "Management Accounting," April 1986.]

47. While inventory valuation is still part of the fundamental relationship, managerial cost accounting serves financial accounting in several other ways. Fundamentally, managerial cost accounting should assist financial accounting in determining the results of operations during a fiscal period by providing relevant data that are accumulated to produce operating expenses. These data include the allocation of capitalized costs to periods of time or units of usage.

48. Traditionally, managerial cost accounting information pertaining to financial accounting has involved costs of past transactions and the assignment of transaction value to fiscal periods and outputs. These purposes and uses are closely aligned with the financial accounting activity and traditional external financial reporting. This past cost aspect has been acknowledged in Objectives of Federal Financial Reporting which states that "financial accounting is largely concerned with assigning the value of past transactions to appropriate time periods."[Footnote 12]

[Footnote 12: Statement of Federal Financial

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

Accounting Concepts No.1, "Objectives of Federal Financial Reporting," par. 168, page 55.]

Relationship to Budgetary Accounting

49. Managerial cost accounting should also provide budgetary accounting with cost information. However, the two are not as closely aligned as is the case with financial accounting (see Figure 1). Mostly, this is because costs are usually recorded, accumulated, and allocated by managerial cost accounting on an accrual basis of accounting which is different from the obligation or cash basis generally used in budgetary accounting.

50. Still, managerial cost accounting does provide cost information to budgetary accounting for use in preparing yearly and long-term budgets for required materials, supplies, equipment, human resources, and other resources needed to produce different levels of outputs. Managerial cost accounting also helps in making many budgetary decisions such as those concerning future capital expenditures and purchase/lease alternatives.

51. It is important to note that the Board's authority does not extend to recommending budgetary standards or budgetary concepts, and that is not the purpose of this statement.[Footnote 13] However, the Board is committed to providing relevant and reliable cost accounting information that supports budget planning, formulation, and execution.

[Footnote 13: Memorandum of Understanding establishing the FASAB, October 10, 1990.]

Cost Information for Management Purposes

52. Managerial cost accounting produces information directly for management use, sometimes employing data produced by the budgetary and financial accounting processes. Cost information is used for many different purposes which can be generally classified into five types: performance

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

measurement; cost reduction and control; determination of reimbursements and fee or price setting; program authorization, modification, and discontinuation decisions; and decisions to contract out work or make other changes in the methods of production.

53. To meet these needs, managerial cost accounting should use basic cost data and non-financial or programmatic data. For example, it tracks units of output produced and input used including the amount of labor in terms of employees or employee-hours. Sometimes, information from cost analysis is used to compare actual to predetermined or anticipated costs. An organization may use cost estimates, cost studies, and cost finding techniques.

54. While managerial cost accounting is concerned not only with past costs and future costs, one of its most important features is the use of present costs to assist management. This current cost aspect of managerial cost accounting is referred to in the Objectives of Federal Financial Reporting where is states that "accounting data may be further assigned, allocated, or associated with units of activity or production, segments of organizations, etc., within the same time period. These kinds of intraperiod allocations are developed most extensively in the branch of accounting called cost accounting. Neither the FASB nor the GASB has devoted much attention to this branch of accounting, but the FASAB, because of its unique mission, will need to do so."[Footnote 14] Managerial cost accounting information pertaining to present costs is most often used for controlling and reducing those costs, controlling work processes, and measuring current performance.

[Footnote 14: Statement of Federal Financial Accounting Concepts No. 1, "Objectives of Federal Financial Reporting," par. 174, page 56.]

Reporting Relationships

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

55. Proper financial management requires that the three accounting processes work closely together to provide useful reporting to both internal and external users. The internal-external dual focus of federal reporting has been established in the Objectives of Federal Financial Reporting. It states that "The FASAB and its sponsors believe that any description of federal financial reporting objectives should consider the needs of both internal and external users and the decisions they make." In addition, it says that "the FASAB...considers the information needs of both internal and external users. In part, this is because the distinction between internal and external users is in many ways less significant for the federal government than for other entities." It goes on to classify the users of financial information into four major groups: program managers, executives, the Congress, and citizens.[Footnote 15] These categories include both internal and external users.

[Footnote 15: Ibid., pars. 23, 25, page 9; and par. 75, page 26.]

56. Federal financial reporting encompasses general and special purpose reports to meet the needs of the four user groups. Information produced by managerial cost accounting appears in or influences both types of reports.[Footnote 16] As discussed above, managerial cost accounting should provide information for use by both financial accounting and budgetary accounting. That information is used by those processes in producing both general purpose and special purpose reports.

[Footnote 16: The types of general purpose and special purpose reports are discussed in Statement of Federal Financial Accounting Concepts No.1, "Objectives of Federal Financial Reporting," Chapter 7.]

57. Managerial cost accounting also results in reports of its own. Most often these are special purpose reports designed for internal users, typically program and line managers. However,

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

they may be for groups generally considered external users.

58. One of the most important aspects of reporting in which managerial cost accounting plays a large role is that of performance reporting. Measuring and reporting actual performance against established goals is essential to assess governmental accountability. Cost information is necessary in establishing strategic goals, measuring service efforts and accomplishments, and relating efforts to accomplishments. The importance of cost information in relation to performance measurement and performance reporting has been recognized in the Objectives of Federal Financial Reporting, which said "One reason for performing cost accounting is to assist in performance measurement" and it also stated that "The topics of cost and performance measurement are related because it is by associating cost with activities or 'cost objectives' that accounting can make much of its contribution to reporting on performance."[Footnote 17]

[Footnote 17: Ibid., par. 174, page 56; and par. 192, page 63.]

Basis of Accounting and Recognition/Measurement Methods

59. Costs may be measured, analyzed, and reported in many ways. A particular cost measurement has meaning only when considering its purpose. The measurement of costs can vary depending upon the circumstances and purpose for which the measurement is to be used. In Objectives of Federal Financial Reporting, it is stated that "the Board's own focus is on developing generally accepted accounting standards for reporting on the financial operations, financial position, and financial condition of the federal government and its component entities and other useful financial information. This implies a variety of measures of costs and other information that complements

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

the information available in the budget [emphasis added]."[Footnote 18]

[Footnote 18: Ibid., par. 191, page 62.]

60. In addition, it is stated that "In defining the proper measurement, assignment, and allocation of cost for a given purpose, selecting the appropriate accounting method and whether to use full costing should be carefully considered."[Footnote 19] Further, it added that "The accrual basis of accounting generally provides a better matching of costs to the production of goods and services, but its use and application for any given purpose must be carefully evaluated."[Footnote 20]

[Footnote 19: Ibid., par. 196, page 64.]

[Footnote 20: Ibid., par. 197, page 64.]

61. Therefore, managerial cost accounting should provide cost information using a basis of accounting and recognition/measurement standards that are appropriate for the intended use of the information. When managerial cost accounting is used to supply information for use by financial accounting and financial reporting, that information should be consistent with the basis of accounting and recognition/measurement standards required by federal accounting principles. Traditionally this has meant the use of accrual accounting and historical cost measurement, particularly in general purpose reports.

62. When managerial cost accounting is used to supply information for the preparation and review of budgets, cost data should be consistent with the basis of accounting and recognition/measurement used in financial reporting, but may be adjusted to meet the budgetary information needs.

63. Special purpose cost studies and analyses are sometimes performed for decision making. In those studies and analyses, management may need to

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

develop cost data beyond those currently reported in general purpose financial reports. For example, in making planning decisions, management may develop replacement costs and capital costs. However, the basis and methods used should be appropriate for the circumstances and consistent with the intended purposes.

Reconciliation of Information

64. Different bases of accounting will produce different costs for the same item, activity, or entity. This can confuse users of cost information. Therefore, reports that use different accounting bases or different recognition and measurement methods should be reconcilable, and should fully explain those bases and methods. Regardless of the type of report in which it is presented, cost information should ultimately be traceable back to the original common data source.

65. To be reconcilable, the amount of the differences in the information reported should be ascertainable and the reasons for the differences should be explainable. In some situations, informational differences may be clearly understandable without further explanation. However, other cases may require a narrative statement concerning the differences. In complicated situations, a schedule or table may be required to fully explain the differences.

66. Financial reporting has long recognized the necessity for reconciliation between information reported on different accounting bases. Reconciliations have been required in federal financial reports to show and explain significant differences between budget reports and financial statements prepared in accordance with generally accepted accounting principles.

****

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

REQUIREMENT FOR COST ACCOUNTING

Each reporting entity [Footnote 21] should accumulate and report the cost of its activities on a regular basis for management information purposes. Costs may be accumulated either through the use of cost accounting systems or through the use of cost finding techniques.

[Footnote 21: The term "reporting entity" as used in this docoment conveys the same meaning as defined in FASAB Statement of Recommended Accouynting Concepts No. 2, "Entity and Display" (May 1995).]

67. Cost information is essential to effective financial management and should play an important role in federal financial reporting. Managerial cost accounting processes are the means of providing cost information in an efficient and reliable manner on a continuing basis.

Need for Consistent Cost Accounting on a Regular Basis

68. To perform managerial cost accounting on a "regular basis" means that entities should establish procedures to accumulate and report costs continuously, routinely, and consistently for management information purposes. Consistent and regular cost accounting is needed to meet the second objective of federal financial reporting which states information should be provided to help the user determine the costs of providing specific programs and activities and the composition of, and changes in those costs. That objective also requires the reporting of performance information of federal programs and the changes over time in that performance in relation to the costs.

69. The requirement for managerial cost accounting on a regular and consistent basis supports recent legislative actions. The CFO Act of 1990 states that agency CFOs shall provide for the development and reporting of cost information

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

and the periodic measurement of performance. In addition, the GPRA of 1993 requires each agency, for each program, to establish performance indicators and measure or assess relevant outputs, service levels, and outcomes of each program as a basis for comparing actual results with established goals. The nature of these legislative mandates requires reporting entities to develop and report cost information on a consistent and regular basis.

70. The managerial cost accounting processes consist of collecting data from the common data source, processing that data, and reporting cost and output information in general purpose and special purpose reports. Appropriate procedures and practices should also be established to enable the collection, measurement, accumulation, analysis, interpretation, and communication of cost information. This can be accomplished through the use of a cost accounting system or the use of cost finding techniques and other cost studies and analyses. A cost accounting "system" is an organized grouping of methods and activities designed to consistently produce reliable cost information.

Basic Cost Accounting Processes

71. Regardless of whether a reporting entity uses a cost accounting system or cost finding techniques, the methods and procedures followed should be designed to perform at least a certain minimum level of cost accounting and provide a basic amount of cost information necessary to accomplish the many objectives associated with planning, decision making, control, and reporting. The more important of these minimum criteria for cost accounting are associated with the standards in the remainder of this statement. Others are also important.

-- Responsibility Segments - Cost information should be collected by responsibility segments which have been identified by management and outputs should be defined for

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

each responsibility segment.[Footnote 22]

[Footnote 22: See standard in this statement concerning responsibility segments.]

-- Full Costing - Each reporting entity should measure the full cost of outputs so that total operational costs and total unit costs of outputs can be determined. "Full cost" includes the cost of goods or services provided by other entities when the applicable criteria are met.[Footnote 23]

[Footnote 23: See standard concerning full costs and standard concerning inter-entity costing.]

-- Costing Methodology - The costing methodology used (e.g., activity-based costing, job order costing, standard costing, etc.) should be appropriate for management's needs and the operating environment.[Footnote 24]

[Footnote 24: See standard concerning costing methodology.]

-- Performance Measurement - Cost accounting should provide information needed to determine and report service efforts and accomplishments and information necessary to meet the requirements of the GPRA or interface with a system that provides such information. This includes the quantity of inputs and outputs and other non-financial information needed in the measurement of performance.

-- Reporting Frequency - Cost information should be reported in a timely manner and on a regular basis consistent with the needs of management and the requirements of both budgetary and financial reporting.

-- Standard General Ledger - Managerial cost accounting should be integrated with general financial accounting. Both depend on the standard general ledger for basic financial

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

transaction data.

-- Precision of Information - Cost information supplied to internal and external users should be reliable and useful in making evaluations or decisions. At the same time, unnecessary precision and refinement of data should be avoided.

-- Special Situations - The managerial cost accounting processes should be designed to accommodate any of management's special cost information needs that may arise due to unusual or special situations or circumstances. If such cost information is needed on a regular basis, appropriate procedures to provide it should be developed.

-- Documentation - All managerial cost accounting activities, processes, and procedures should be documented by a manual, handbook, or guidebook of applicable accounting operations. This reference should outline the applicable activities, provide instructions for procedures and practices to be followed, list the cost accounts and subsidiary accounts related to the standard general ledger, and contain examples of forms and other documents used.

Complexity of Cost Accounting Processes

72. While each entity's managerial cost accounting should meet the basics discussed above, this standard does not specify the degree of complexity or sophistication of any managerial cost accounting process. Each reporting entity should determine the appropriate detail for its cost accounting processes and procedures based on several factors. These include the:

-- nature of the entity's operations;

-- precision desired and needed in cost information;

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

-- practicality of data collection and processing;

-- availability of electronic data handling facilities;

-- cost of installing, operating, and maintaining the cost accounting processes; and

-- any specific information needs of management.

73. Some entities may find that they can purchase basic "off-the-shelf" cost accounting programs, systems, or processes, or adapt those of other federal agencies. All entities should consider using similar or compatible cost accounting processes throughout their component units to facilitate comparison and consolidation of cost information.

Cost Findings, Studies, and Analyses

74. A cost accounting system is a continuous and systematic cost accounting process which may be designed to accumulate and assign costs to a variety of objects routinely or as desired by the management. Such a system may be best for some reporting entities.

75. Some entities may not need a sophisticated system to perform detailed cost accumulation and assignment. They need to accumulate and report costs regularly as required by this standard, but they may determine and analyze costs through special cost studies and analyses. Also, some entities may use a combination of a system supplemented by cost studies.

76. Cost information may be developed and savings achieved in some cases by the use of special cost studies or cost analyses to develop information helpful in certain decision making situations. In addition, cost finding techniques may be used to determine the cost of products or services. Cost finding is a method for determining the cost of

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

producing goods or services using appropriate procedures. Cost finding techniques may also be useful for computing costs in cases where the information is not needed on a recurring basis.

RESPONSIBILITY SEGMENTS

Management of each reporting entity should define and establish responsibility segments. Managerial cost accounting should be performed to measure and report the costs of each segment's outputs. Special cost studies, if necessary, should also be performed to determine the costs of outputs.

77. The standard states that the management of each reporting entity should define and establish responsibility segments. This section explains the concept of responsibility segment, purposes of segmentation, and how responsibility segments can be structured.

Defining Responsibility Segments

78. A responsibility segment is a component of a reporting entity[Footnote 25] that is responsible for carrying out a mission, conducting a major line of activity, or producing one or a group of related products or services. In addition, responsibility segments usually possess the following characteristics:

[Footnote 25: The term "reporting entity" referred to in this document conveys the same meaning as defined in FASAB Statement of Recommended Accounting Concepts No. 2 Entity and Display (May 1995).]

(1) Their managers report to the entity's top management directly;

(2) Their resources and results of operations can be clearly distinguished from those of other segments of the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

entity.[Footnote 26]

[Footnote 26: These two characteristics make responsibility segments, as the term is used in this document, differ from cost centers. A cost center can be at any level of an organization and may not report to the top management directly. As will be explained later, a responsibility segment can contain cost centers in itself.]

79. A responsibility segment is a unit for which managerial cost accounting is performed. Entities may use a centralized accounting system or segment-based systems to provide cost information for each segment. For each segment, managerial cost accounting should:

(1) Define and accumulate outputs, and if feasible, quantify each type of output in units;

(2) Accumulate costs and quantitative units of resources consumed in producing the outputs; and

(3) Assign costs to outputs, and calculate the cost per unit of each type of output.

80. Some reporting entities may have only one responsibility segment, if they perform one single mission or one type of service. Other reporting entities may have several responsibility segments. Also, a sub-organization of the federal government may be a reporting entity in itself and, at the same time, it may also be a responsibility segment of a higher level reporting entity to which it belongs. The Forest Service, for example, may be a reporting entity because it may meet the reporting entity criteria. As such, it may establish responsibility segments for itself. At the same time, the Forest Service may be regarded as a responsibility segment of the Department of Agriculture, of which it is a component.

81. However, for a given reporting entity, its

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

management should establish one or more responsibility segments to perform managerial cost accounting functions.

Purposes of Segmentation

82. A basic purpose of dividing an entity into segments is to determine and report the costs of services and products that each segment produces and delivers. Many federal departments and agencies manage programs that produce a variety of goods and services. Accounting for entity-wide revenues and expenses in aggregate would serve financial reporting for the entity, but would not serve costing purposes. In order to determine the cost of each type of service or product, it is necessary to divide an entity into segments such that each segment is responsible for certain types of services or products. Each segment can then be used as a vehicle for accumulating costs incurred by the segment to match with its outputs. Each segment can use a cost methodology that is best suited to its operations.

83. Another important purpose of segmentation is to facilitate cost control and management. Cost information provided for each segment helps managers to examine costs of specific resources consumed and activities performed in each segment. Managers can analyze cost variances in both dollars and the units of resources consumed against budgets or standards. Since each segment performs a particular pattern of processes and activities to produce its output, managers can analyze those processes and activities to compare their costs with the value they contribute to the output.

84. For entities that consist of components engaging in diverse lines of activities, it is desirable to provide financial reports that display information for significant components individually and of the entity in its entirety.[Footnote 27] Some entities may find costs accumulated by segments useful in support of financial reporting by components.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

[Footnote 27: This point is discussed in FASAB Statement of Recommended Accounting Concepts No. 2, "Entity and Display," pars. 75-76, pages 25-26.]

85. For internal management, segmentation could also facilitate performance measurement. Since each segment is responsible for a mission, or a line of activity to produce a certain type of output, performance goals can be set for each segment based on its specific tasks and operating patterns. Information on costs, outputs, and outcomes related to each segment can be used to measure its performance against the goals. The results of the segment performance measurement could also support external reporting on performance measures for the entire reporting entity or its major programs.

Structuring Responsibility Segments

86. Reporting entity management should define and structure its responsibility segments. The designation of responsibility segments should be based on the following factors: (a) the entity's organization structure, (b) its lines of responsibilities and missions, (c) its outputs (goods or services it delivers), and (d) budget accounts and funding authorities. However, the predominant factor is the reporting entity's organization structure and its existing responsibility components, such as bureaus, administrations, offices, and divisions within a department.

87. The U.S. General Services Administration, for example, provides five distinct services: (1) managing public buildings, (2) distributing supplies, (3) providing travel and transportation services, (4) managing information resources (including communication and data processing services), and (5) disposal of real properties. Each of those service areas could be designated as a responsibility segment. The Department of Veterans Affairs (VA), among its other services, provides health care to veterans, pays veterans'

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

compensation and pension benefits, and provides home loans and home loan guarantees to veterans. Each of these program areas could constitute a responsibility segment.

88. Since responsibility segments are major parts of an entity, some segments may carry more than one program. Some programs may be jointly managed by two or more segments. Thus, each segment must accumulate costs for each type of output produced for various programs. To accomplish this, a network of cost centers can be established within a segment to accumulate costs. Managers of each cost center will be provided with information to control and manage costs within their area of responsibility. Depending on operational patterns and cost methods, cost centers can be structured along different dimensions, such as organizational units, operating processes, and activities.

FULL COST

Reporting entities should report the full costs of outputs in general purpose financial reports. The full cost of an output produced by a responsibility segment is the sum of (1) the costs of resources consumed by the segment that directly or indirectly contribute to the output, and (2) the costs of identifiable supporting services provided by other responsibility segments within the reporting entity, and by other reporting entities.

89. This standard states that reporting entities should measure and report the full costs of their outputs in general purpose financial reports. "Outputs" means products and services generated from the consumption of resources. The full cost of a responsibility segment's output is the total amount of resources used to produce the output. This includes direct and indirect costs that contribute to the output, regardless of funding sources. It also includes costs of supporting services provided by other responsibility segments

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

or entities. The standard does not require full cost reporting in federal entities' internal reports or special purpose cost studies. Entity management can decide on a case-by-case basis whether full cost is appropriate and should be used for internal reporting and special purpose cost studies.

Direct Costs

90. Direct costs are costs that can be specifically identified with an output. All direct costs should be included in the full cost of outputs. Typical direct costs in the production of an output include:

(a) Salaries and other benefits for employees who work directly on the output;

(b) Materials and supplies used in the work;

(c) Various costs associated with office space, equipment, facilities, and utilities that are used exclusively to produce the output; and

(d) Costs of goods or services received from other segments or entities that are used to produce the output (See discussions and explanations in the next section on "Inter-Entity Costs").

Indirect Costs

91. Indirect costs are costs of resources that are jointly or commonly used to produce two or more types of outputs but are not specifically identifiable with any of the outputs. Typical examples of indirect costs include costs of general administrative services, general research and technical support, security, rent, employee health and recreation facilities, and operating and maintenance costs for buildings, equipment, and utilities. There are two levels of indirect

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

costs:

(a) Indirect costs incurred within a responsibility segment. These indirect costs should be assigned to outputs on a cause-and-effect basis, if such an assignment is economically feasible, or through reasonable allocations. (See discussions on cost assignments in the "Costing Methodology" section.)

(b) Costs of support services that a responsibility segment receives from other segments or entities. The support costs should be first directly traced or assigned to various segments that receive the support services. They should then be assigned to outputs.

92. A reporting entity and its responsibility segments may incur general management and administrative support costs that cannot be traced, assigned, or allocated to segments and their outputs. These unassigned costs are part of the organization costs, and they should be reported on the entity's financial statements (such as the Statement of Net Costs) as costs not assigned to programs.[Footnote 28]

[Footnote 28: A similar explanation is provided in FASAB Statement of Recommended Accounting Concepts No. 2, Entity and Display, par. 95, page 33.]

Certain Cost Elements

93. Costs of Employees' Benefits

Employee benefits include:

(a) Health and life insurance benefits for current employees covered in part by the government's contribution to health and life insurance premiums;

(b) Pension benefits for employees, their survivors, and dependents, covered by defined

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

pension plans such as Civil Service Retirement System (CSRS), Federal Employees Retirement Plan (FERS), and Military Retirement System (MRS);

(c) Health and life insurance benefits for retired employees, their survivors and dependents, covered in part by the government's contribution to health and life insurance premiums, and referred to as "other retirement benefits" (ORB) in this document;

(d) Other postemployment benefits (OPEB) for terminated and inactive employees, which include severance payments, training and counseling, continued health care, and unemployment and workers compensation.

94. Most of the employee benefit programs are covered by trust funds administered by the Office of Personnel Management (OPM) and the Department of Defense (DoD). Contributions to the trust funds come from three sources: current and retired employees, employing agencies, and direct appropriations. The management expenses of the trust funds are paid with the funds' receipts.

95. Federal financial accounting standards require that the employing entity accrue the costs to the federal government of providing pension and ORB benefits to employees and recognize the costs as an expense when the benefits are earned.[Footnote 29] The employing entity should recognize those expenses regardless of whether the benefits are funded by the reporting entity or by direct appropriations to the trust funds. This principle should also be applied to health and life insurance benefits for current employees and comparable benefits for military personnel. The costs of employee benefits incurred by responsibility segments should be directly traced or assigned to outputs.

[Footnote 29: FASAB Exposure Draft, "Accounting for Liabilities of the Federal Government" (November 7, 1994), pars. 62-99, pages 26-46.]

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

96. OPEB costs include severance payments, counseling and training, health care, and workers compensation benefits paid to former or inactive employees. OPEB costs are often incurred as a result of such events as reductions in force or on-the-job injuries of employees. Federal financial accounting standards require that OPEB costs be reported as an expense for the period during which a future outflow or other sacrifice of resources is probable and measurable on the basis of events occurring on or before the accounting date.[Footnote 30]

[Footnote 30: Ibid., pars. 100-102, page 47.]

97. Since the recognition of OPEB costs is linked to the occurrence of an OPEB event rather then the production of output, in many instances, assigning OPEB costs recognized for a period to output of that period would distort the cost of output. In special purpose cost studies or cost findings, management may distribute OPEB costs over a number of years in the past to determine the costs of the outputs that the OPEB recipients helped to produce.

Costs of Public Assistance and Social Insurance Programs

98. Major costs of welfare, insurance, and grant programs are the costs of resources transferred from the federal government to individuals and state and local governments. Some of them are referred to as "transfer payments." The following are some typical public assistance and insurance programs:

-- Grants, such as aid to state and local governments;

-- Subsidies, such as agricultural commodity price support and stabilization programs;

-- Credit and insurance costs, such as the Family Education Loan Program and Savings

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

Association Insurance;

-- Welfare payments such as Aid to Families with Dependent Children (AFDC); and,

-- Social insurance, such as the Old Age, Survivors, and Disability Insurance Program.

99. The full cost of such a program includes: (a) the costs of federal resources that have been or will be transferred to individuals and state/local governments, and (b) the costs of operating the programs. These two types of costs should be recognized on a basis of accounting that is prescribed within the Federal Financial Accounting Standards. These two types of costs should be separately identified so that each can be used for different analytic purposes.

100. The costs resulting from transfer payments are determined by the level of grants, subsidies, entitlement benefits, credit subsidies, or loss payments made under insurance and guarantee agreements. They are also determined by the number of eligible persons who receive the transfer payments. The program cost of AFDC, for example, depends on the average payment per family, the number of eligible families, and the federal government's share in the payments (some payments are made by state and local governments). Information on this type of cost is useful for making policy decisions about levels of subsidies or benefits, eligibility of recipients, and how transfer payments are made. This cost information is also useful for measuring the cost-effectiveness of a transfer payment program.

101. Program operating costs, on the other hand, are costs of managing the program and delivering the payments. They include the costs of personnel, supplies, equipment, and offices. The costs are related to such activities as screening benefit recipients for eligibility, keeping their accounts, making payments and collections, answering inquiries, etc. Information on this

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

type of cost is useful in measuring the efficiency of program operations.

Costs related to Property, Plant and Equipment

102. Depreciation expense. General property, plant, and equipment are used in the production of goods and services. Their consumption is recognized as depreciation expense. The depreciation expense incurred by responsibility segments should be included in the full costs of the goods and services that the segments produce.

103. Recognizing property acquisition costs as expenses. The costs of acquiring or constructing federal mission and heritage property, plant, and equipment may be charged to expenses at the time the acquisition costs are incurred.[Footnote 31] Since the recognition of these expenses is linked to property acquisition rather than production of goods and services, those expenses should not be included in the full costs of goods and services. However, they are part of the costs of the entity or the program that makes the property acquisitions.

[Footnote 31: In FASAB Exposure Draft, "Accounting for Property, Plant, and Equipment," the Board proposed that the costs of acquiring or constructing "federal mission" and "heritage" property, plant, and equipment be recognized as expenses when the costs are incurred. See the ED, pars. 98-117, pages 29-34.]

Non-production costs

104. A responsibility segment may incur and recognize costs that are linked to events other than the production of goods and services. Two examples of these non-production costs were discussed earlier: (1) OPEB costs that are recognized as expenses when an OPEB event occurs, and (2) certain property acquisition costs that are recognized as expenses at the time of acquisition. Other non-production costs include reorganization costs, and nonrecurring cleanup costs resulting from facility abandonments that

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

are not accrued. Since these costs are recognized for a period in which a particular event occurs, assigning these costs to goods and service produced in that period would distort the production costs. In special purpose cost studies, management may have reasons to determine historical output costs by distributing some of these costs to outputs over a number of past periods. Such distribution may be appropriate when: (a) experience shows that the costs are recurring in a regular pattern, and (b) a nexus can be established between the costs and the production of outputs that may have benefited from those costs.

INTER-ENTITY COSTS

Each entity's full cost should incorporate the full cost of goods and services that it receives from other entities. The entity providing the goods or services has the responsibility to provide the receiving entity with information on the full cost of such goods or services either through billing or other advice.

Recognition of inter-entity costs that are not fully reimbursed is limited to material items that (1) are significant to the receiving entity, (2) form an integral or necessary part of the receiving entity's output, and (3) can be identified or matched to the receiving entity with reasonable precision. Broad and general support services provided by an entity to all or most other entities should not be recognized unless such services form a vital and integral part of the operations or output of the receiving entity.

105. As stated in the preceding standard, to fully account for the costs of the goods and services they produce, reporting entities should include the cost of goods and services received from other entities. Knowledge of these costs is helpful to top level management in controlling and assessing the operating environment. It is also helpful to

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

other users in evaluating overall program costs and performance and in making decisions about resource allocations and changes in programs.

Inter-Entity Activities

106. Within the federal government, some reporting entities rely on other federal entities to help them achieve their missions. Often this involves support services, but may include the provision of goods. Sometimes these arrangements may be stipulated by law, but others are established by mutual agreement of the entities involved. Such relationships can be classified into two types depending upon funding methods.

-- Provision of goods or services with reimbursement -- In this situation, one entity agrees to provide goods or services to another with reimbursement at an agreed-upon price. The reimbursement price may or may not be enough to recover full costs. Usually the agreement is voluntarily established through an inter-agency agreement. Revolving funds can also be included in this group, because they are usually established to recover costs through sale of their outputs to other government entities. They are usually meant to be self-sustaining through their sales, without receiving additional appropriations. However,

they do not always charge enough to cover full costs.

-- Provision of goods or services without reimbursement -- One entity provides goods or services to another entity free of charge. The agreement may be voluntary, legally mandated, or inherently established in the mission of the providing entity.

107. Recently, consideration has been given to

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

expanding the concept of inter-entity support within the federal government. Under this concept, entities could sell their outputs on a competitive basis. Entities would have the authority to purchase goods or services from any federal or private provider. This is seen as a way to improve government efficiency through competition since inefficient government providers would be forced to improve or stop providing these goods or services. This could result in consolidating support services in fewer governmental entities. Underlying this concept is the requirement that all costs be recognized in developing the price at which goods and services would be sold to other entities.

Accounting and Implementation Guidance

108. If an entity provides goods or services to another entity, regardless of whether full reimbursement is received, the providing entity should continue to recognize in its accounting records the full cost of those goods or services. The full costs of the goods or services provided should also be reported to the receiving entity by the providing entity.

109. The receiving entity should recognize in its accounting records the full cost of the goods or services it receives as an expense or, if appropriate, as an asset (such as work-in-process inventory). The information on costs of non-reimbursed or under-reimbursed goods or services should be available from the providing entity. However, if such cost information is not provided, or is partially provided, a reasonable estimate may be used by the receiving entity. The estimate should be of the cost of the goods or services received (the estimate may be based on the market value of the goods or services received if an estimate of the cost cannot be made). To the extent that reimbursement is less than full cost, the receiving entity should recognize the difference in its accounting records as a

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

financing source.[Footnote 32] Inter-entity expenses/assets and financing sources would be eliminated for any consolidated financial statements covering both entities.

[Footnote 32: See Statement of Recommended Federal Accounting Concepts No. 2, Entity and Display, par. 65, page 21. See also, FASAB Exposure Draft, Accounting for Liabilities of the Federal Government, pars. 62-99, pages 26-46, which addresses accounting for pensions and other retirement benefits (ORB). The payment of pension and ORB costs for an entity by another entity has often been likened to providing goods and services.

In the case of pensions, employees of the reporting entity provide services to that entity and part of the salary-related cost is paid by a different entity. The pension administering entity does not provide goods or services to the reporting entity (other than normal pension administration services), but rather pays their costs directly. The difference is subtle but important. However, the accounting is similar. This document is consistent with the section of the liabilities exposure draft dealing with accounting for pensions and other retirement benefits.]

110. Implementation of this standard on inter-entity costing should be accomplished in a practical and consistent manner by the various federal entities. Therefore, the Office of Management and Budget, with assistance from the FASAB staff, should identify the specific inter-entity costs for entities to begin recognizing. OMB should then issue guidance identifying these costs. These particular inter-entity costs should be specified in accordance with this standard including the recognition criteria presented below. The OMB should consider information and advice from Treasury, GAO, and other agencies in developing the implementation guidance. It is anticipated that the largest and most important inter-entity costs will be identified first. As entities gain experience in the application of the standard, recognition of other inter-entity costs may be specified in future guidance or required by future standards.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

Recognition Criteria

111. Ideally, all inter-entity costs should be recognized. This is especially important when those costs constitute inputs to government goods or services provided to non-federal entities for a fee or user charge. The fees and user charges should recover the full costs of those goods and services.[Footnote 33] Thus, the cost of inter-entity goods or services needs to be recognized by the receiving entity in order to determine fees or user charges for goods and services sold outside the federal government. Such recognition, however, should be made in accordance with the implementation guidance issued by OMB as discussed above.

[Footnote 33: OMB Circular A-25 addresses user charges by federal entities.]

112. However, the situation is often different with goods or services transferred within the federal government that do not involve eventual sales to entities outside the federal government. The federal government in its entirety is an economic entity. Therefore, it is reasonable to expect some flow of goods or services between reporting entities as those entities assist each other in fulfilling their missions and operating objectives. There are some cases in which the cost of non-reimbursed or under-reimbursed goods or services received from other entities need not be recognized as part of the cost of the receiving entity. The following general criteria are provided to help in determining the types of -- inter-entity costs that should or should not be recognized.

-- Materiality -- As with other accounting standards, the provisions of this standard need not be applied to immaterial items. However, in the context of deciding which inter-entity transactions are to be recognized, materiality, as used here, is directed to the individual inter-entity

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

transaction rather than to all inter-entity transactions as a whole. Under this concept, a much more limited recognition is intended than would be achieved by reference to the general materiality concept.

In this context, then, materiality should be considered in terms of the importance of the inter-entity transaction to the receiving entity. The importance of the transactions, and thereby their recognition, should be judged in light of the following factors:

* Significance to the entity -- The cost of the good or service is large enough that management should be aware of the cost when making decisions.

* Directness of relationship to the entity's operations -- The good or service provided is an integral part of and necessary to the output produced by the entity.

* Identifiability -- The cost of the good or service provided to the entity can be matched to the entity with reasonable precision.

The determination of whether the cost is material requires the exercise of considerable judgment, based on the specific facts and circumstances of each transaction.

-- Broad, general support -- Some entities provide broad, general support to many, if not all, reporting entities in the federal government. Most often this type of support involves the establishment of policies and/or the provision of general guidance. The costs of such broad services should not be recognized as an expense (or asset) by the receiving entities when there is no reimbursement of costs. Thus the standard does not apply when support is of a general nature provided to all or most entities of the federal government.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

An example of this situation can be found in the Office of Management and Budget which establishes policy and provides general guidance to all parts of the executive branch of government. The costs of OMB should not be spread over all reporting entities because the services provided are (1) general and broad in scope, (2) provided to almost all reporting entities in the executive branch, and (3) not specifically or directly tied to the receiving entity's outputs.

On the other hand, some services provided, under certain circumstances, should still be recognized even though they may be considered broad and general in nature if such services are integral to the operations of the receiving entity. Such services include check writing by the Department of Treasury or legal activities performed by the Department of Justice. For example, when the issuance of checks is integral to the operations of an entity (e.g., the Internal Revenue Service and the Social Security Administration), the receiving entity should include the full cost of issuing checks in the full cost of its outputs. However, if the issuance of checks is insignificant and incidental to the operations of an entity, the entity should not normally recognize that cost.

113. The decision as to whether the cost of non-reimbursed or under-reimbursed goods and services should be recognized requires the use of judgement. None of the criteria listed above are, by themselves, fully or exclusively determinative. They should be considered in combination. Ultimately, inclusion or exclusion of the cost should be decided based on the specific facts and circumstances of each case, with consideration of the degree to which inclusion or exclusion would change or influence the actions and decisions of a reasonable person relying on the information provided.

Accounting Example

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

114. The following tables provide an example of the accounting entries to be made when the receiving entity (Agency R) recognizes an expense for services received from a providing entity (Agency P) on a non-reimbursable basis. In the example, the full costs of these services to Agency P are $100,000.

115. Agency R recognizes an "Expense of services provided by Agency P" equal to the full cost of the services received. It also recognizes a financing source, "Services provided by Agency P," equal to the amount not reimbursed, which in this case is the full $100,000. Agency P recognizes an "Expense of services provided to Agency R" equal to the full cost of the services provided with a credit to "Appropriations used."

Table 1: Agency R's Accounting Entries *

	Debit	Credit
Expense of services provided by Agency P:	$100,000	
Services provided by Agency P:		$100,000

* This example shows the cost recognized as an expense. However, as discussed in the text, it may be an asset.

Table 2: Agency P's Accounting Entries

	Debit	Credit
Expense of services provided to Agency R:	$100,000	
Appropriated capital	$100,000	
Fund balance with Treasury		$100,000
Appropriated capital used		$100,000

COSTING METHODOLOGY

Costs of resources consumed by responsibility segments should be accumulated by type of resource. Outputs produced by responsibility segments should be accumulated and, if practicable, measured in units. The full costs of resources that directly or indirectly contribute to the production of outputs should be assigned to outputs through costing methodologies or cost finding techniques that are most appropriate to the segment's operating environment and should be followed consistently.

The cost assignments should be performed by the following methods listed in the order of preference: (a) directly tracing costs wherever feasible and economically practicable, (b) assigning costs on a cause-and-effect basis, or (c) allocating costs on a reasonable and consistent basis.

116. This standard addresses two aspects of costing: cost accumulation and cost assignment. Each of them is explained and discussed below.

Cost Accumulation

117. Cost accumulation is the process of collecting cost data in an organized way. The standard requires that costs be accumulated by responsibility segments. The accumulation is for costs incurred within each responsibility segment, and does not involve the assignment or allocation of costs incurred by other supporting segments, which will be discussed in the latter part of this section.

118. In the section of this document relating to "Responsibility segments," it was explained that: "A responsibility segment is a component of a reporting entity, that is responsible for carrying out a mission, conducting a major line of

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

activity, or producing one or a group of related products or services." The accumulation of costs by responsibility segments does not mean that each responsibility segment must have its own accounting system. The reporting entity may have a centralized accounting system, but the system should be capable of identifying costs with responsibility segments.

119. This standard also requires that the accumulated costs be classified by type of resource, such as costs of employees, materials, capital, utilities, rent, etc. When appropriate and cost effective, information on quantitative units related to various cost categories should be maintained. For example, staff-days may be reported for staff salaries and benefits, and gallons of gasoline consumed for gasoline costs. The quantitative units are useful for cost assignments, and are indispensable for measuring efficiency in using resources.

Cost Assignment

120. The term "cost assignment" refers to the process that identifies accumulated costs with reporting periods and cost objects. The assignment of costs to time periods is to recognize costs either as expenses or assets for each reporting period. It is governed by accounting standards on recognition of assets and expenses, and will not be addressed in this document. This section addresses cost assignment to cost objects. The word "assignment" used in this document includes various methods of attributing costs, such as direct tracing, cause-and-effect basis, and cost allocations.

121. The term "cost object" refers to an activity or item whose cost is to be measured.[Footnote 34] In a broad sense, a cost object can be an organizational division, program, activity, task, product, service, or customer. However, the purpose of cost accounting by a responsibility segment is to measure the costs of its outputs. Thus, the final cost objects of a responsibility

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

segment are its outputs: the services or products that the segment produces and delivers, the missions or tasks that the segment performs, or the customers or markets that the responsibility segment serves. There may be intermediate cost objects that are used in the course of the cost assignment process.

[Footnote 34: Some literature, the CASB pronouncements for example, use the term "cost objective" for the same meaning.]

122. Some responsibility segments of an entity may provide supporting services or deliver intermediate products to other segments within the same entity. The costs of the supporting services and intermediate products should be assigned to the segments that receive the services and products. This is referred to as the intra-entity cost assignments. Also, in accordance with the inter-entity cost standard discussed in the preceding section, an entity should recognize inter-entity costs for goods and services received from other federal entities. The inter-entity costs should also be assigned to the responsibility segments that use the inter-entity services and products.

123. Thus, with respect to each responsibility segment, the costs that are to be assigned to outputs include: (a) direct and indirect costs incurred within the responsibility segment, (b) costs of other responsibility segments that are assigned to the segment, and (c) inter-entity costs recognized by the receiving entity and assigned to the segment. If a responsibility segment produces one kind of output only, costs of resources used to produce the output are assigned to the output.

124. This standard is intended to establish a principle, rather than a methodology, for cost assignment. Also cost assignments may be performed in cost findings and studies or may be performed within a system on a regular basis. In principle, costs should be assigned to outputs in

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

one of the methods listed below in the order of preference:

(a) Directly tracing costs wherever economically feasible;

(b) Assigning costs on a cause-and-effect basis; and

(c) Allocating costs on a reasonable and consistent basis.

125. These principles apply to all levels of cost assignments including: (1) assigning inter-entity costs to segments, (2) assigning the costs of support services and intermediate products among segments of an entity (the intra-entity cost assignments), and (3) assigning direct and indirect costs to outputs.

Directly tracing costs to outputs

126. Direct tracing applies to resources that are directly used in the production of an output. Examples of such resources include materials that are used in the production, employees who directly worked on the output, facilities and equipment used exclusively in the production of the output, and goods or services received from other entities that are directly used in the production of the output.

127. The method of direct cost tracing usually relies on the observation, counting, and/or recording of the consumption of resource units, such as staff hours or days that are spent on a project or assignment, or gallons of fuel consumed in a transport mission. Direct tracing also applies to specific resources that are dedicated to particular outputs.

128. Direct cost tracing often minimizes distortion and ensures accuracy in cost assignments. However, it can be a relatively costly process. It should be applied only to items that account for a substantial portion of

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

the cost of an output and only when it is economically feasible. For example, it is usually unnecessary to trace the cost of office supplies (pens, papers, computer disks, etc.) to various activities or outputs. The cost of so doing usually outweighs the benefit of the increased accuracy in assigning the resources.

Assigning costs on a cause-and-effect basis

129. For the costs that are not directly traced to outputs, it is preferable that they be assigned to them on a cause-and-effect basis. As mentioned earlier, the ultimate cost objects of a responsibility segment are its outputs. For costs that are not traced to the ultimate objects (outputs), intermediate objects can be established as links between resource costs and outputs. The links reflect a cause-and-effect relationship between resource costs and outputs. Costs that have a similar cause-and-effect relationship to outputs can be grouped into cost pools. (This similar relationship is referred to in some literature as the "cost pool homogeneity concept.")

130. Activities or work elements that contribute to or support the production of outputs are commonly used as intermediate objects. This is based on the premise that on one hand, outputs require the performance of certain activities, and on the other hand the activities cause costs. Thus, an activity is considered a linkage between the cause and the effect. (See also, discussions on Activity-Based Costing later in this section.) In its policy statement, the Cost Accounting Standards Board expressed a similar view:

> "The preferred presentation of the relationship between the pooled cost and the benefiting cost objectives is a measure of the activity (input) of the function or functions represented by the pool of cost. This relationship can be measured in

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

> circumstances where there is direct and definitive relationship between the function or functions and the benefiting cost objectives."[Footnote 35]

[Footnote 35: Cost Accounting Standards Board, Restatement of Objectives, Policies and Concepts, par. 2915.]

131. For example, a computer technology department provides technical support to other departments of an organization. The costs of the department may be assigned to other departments on a cause-and-effect basis through two steps. In the first step, the costs are assigned to the activities of the department, such as hardware installation and maintenance, software design and installation, or programming adjustments. In the second step, the costs of these activities are further assigned to other departments based on their consumption of the technical services.

132. Sometimes, an intermediate product, rather than an activity, can be used as a link between the costs and outputs. For example, a hospital laboratory's costs can first be assigned to various medical tests it runs. The costs of the tests can then be assigned to the operating units of the hospital that ordered the tests.

Allocating costs

133. Sometimes, it might not be economically feasible to directly trace or assign costs on a cause-and-effect basis. These may include general management and support costs, depreciation, rent, maintenance, security, and utilities associated with facilities that are commonly used by various segments.

134. These supporting costs can be allocated to segments and outputs on a prorated basis. The cost allocations may involve two steps. The first step allocates the costs of support services to segments, and the second step allocates those costs to the outputs of each segment. The cost

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

allocations are usually based on a relevant common denominator such as the number of employees, square footage of office space, or the amount of direct costs incurred in segments.

135. Suppose the total cost of a personnel department for a fiscal year is $500,000, and it is allocated to two segments based on the number of employees of the two segments: segment A has 300 employees, and segment B has 200 employees. On the prorated basis, segment A should be allocated 60 percent, or $300,000 of the personnel cost, and segment B should be allocated 40 percent, or $200,000 of the personnel department cost. The allocation is shown below:

Table 3: The Allocation of the Personnel Dept. Costs

Segment	Employees	Percent	Allocated amount
A	300	60	$300,000
B	200	40	$200,000
Total	500	100	$500,000

136. For cost allocation purposes, indirect costs may be grouped into pools, and each pool is subject to one allocation base. Costs grouped into one pool should have similar characteristics. The allocation base should be used consistently to allow cost comparison from one period to another.

137. Cost allocation is a relatively simple method of assigning indirect costs to cost objects. Users of the cost information should be aware that distortions in product costing often result from arbitrary cost allocations. In most cases, there is little correlation between an indirect cost and the allocation base, and the allocation is arbitrary. To assist cost analyses and cost findings, cost accounting should segregate costs that are traced or assigned to outputs from costs that are allocated to outputs.

Assigning common costs

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

138. Facility and personnel resources may be shared by two or more activities either at the same time or in different times during a fiscal year. For example, a military aircraft maintained for war readiness may be used in peacetime to transport cargo. As another example, a plant may be used to process two or more products.

139. The cost assignment principles discussed in this section should apply to assigning costs to activities or outputs that share the use of resources. Costs that can be traced to each of the activities (or outputs) should be assigned to them directly. These include direct operating costs of each of the activities. For the military aircraft used in peacetime to transport cargo, for example, the costs of fuel and supplies, additional personnel who worked on the cargo, and other costs incidental to the transportation should be directly assigned to the transportation services.

140. To determine the full cost of each of the activities or outputs that share resources, indirect common costs should be assigned to those activities. The term "common costs" refers to the costs of maintaining and operating facilities and other resources that cannot be directly traced to any one of the activities or outputs that share the resources.[Footnote 36 Common costs should be assigned to activities either on a cause-and-effect basis, if feasible, or through reasonable allocations.

[Footnote 36: This definition is adapted from Statement No. 1 on Management Accounting: Management Accounting Glossary, published by the National Association of Accountants (Montvale, New Jersey: 1991), page 15.]

141. Sometimes management may find it useful to designate primary and secondary activities that share resources. Primary activity is the primary purpose or mission for which the resources are made available. Secondary activities are those

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

activities that are performed only if they will not interfere with the primary activity. Management can then determine two types of costs: (1) the costs that are necessary for the primary activity and are unavoidable even without the secondary activities, and (2) the costs that are caused by the secondary activities and are incremental to the costs of the primary activity. This type of cost information can be produced through cost findings, and may help management in making resource allocation and capacity utilization decisions.

Cost-benefit considerations

142. Throughout the discussions of this section, it is stated that a cost accumulation and assignment method would be used when it is economically feasible. A method is economically feasible if the benefits resulting from implementing the method outweigh its costs. It is not advantageous to use a costing method if it requires a large amount of resources and yet produces information of little value to users.

143. As a general rule, directly tracing costs and assigning costs on a cause-and-effect basis are more expensive than cost allocations, because they require detailed analyses and record-keeping for costs and activities. However, they are preferable because they produce more reliable cost information than cost allocations.

Selecting a Costing Methodology

144. This standard does not require the use of a particular type of costing system or costing methodology. Federal entities are engaged in a broad range of diverse operations. A costing system appropriate for one type of operation may not be appropriate for other operations. At many federal agencies, cost accounting practices are either relatively new or experimental. It is too early to tell which cost systems are best for specific types of operations. As experience and research in cost accounting progress, reporting

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

entities and responsibility segments may find a preferred costing methodology for their operations.

145. Agency and program management is in the best position to select a type of costing system that would meet its needs. In making the selection, management should evaluate alternative costing methods and select those that provide the best results under its operating environment.

146. The standard requires that a costing methodology, once adopted, be used consistently. Consistent use provides cost information that can be compared from year to year. However, this requirement does not preclude necessary improvements and refinements to the system or methodology, so long as the effect of any change is documented and explained. On the contrary, improvements are encouraged.

147. Several costing methodologies have been successful in the private sector and in some government entities. Four are briefly described below for agency consideration. It should be noted in particular that activity-based costing has gained broad acceptance by manufacturing and service industries as an effective managerial tool. Federal entities are encouraged to study its potential within their own operations. In the following paragraphs, activity-based costing will be introduced with other well known costing methodologies, namely job order costing and process costing. Standard costing is also mentioned as an important cost management tool. It is important to note that those costing methodologies are not mutually exclusive. Both activity-based costing and standard costing can be applied to job order or process costing systems.

Activity-based costing (ABC)

148. ABC focuses on the activities of a production cycle, based on the premises that (a) an output requires activities to produce, and (b) activities

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

consume resources. ABC systems use cost drivers to assign costs through activities to outputs. The ABC cost assignment is a two-stage procedure. The first stage assigns the costs of resources to activities and the second stage assigns activity costs to outputs. The procedure is illustrated in the following figure.[Footnote 37]

[Footnote 37: The figure and the accompanying discussions are based on Robin Cooper, Robert S. Kaplan, Lawrence S. Maisel, Eileen Morrissey, and Ronald M. Oehm, Implementing Activity-Based Cost Management (Montvale, NJ: Institute of Management Accountants, 1992), pages 9-1.]

Figure 2: The Activity-Based
Two Stage Costing Procedure

RESOURCES ...(first stage)....ACTIVITIES

ACTIVITIES...(second stage)...OUTPUTS

149. Implementing an ABC system requires four major steps: (1) identify activities performed in a responsibility segment to produce outputs, (2) assign or map resources to the activities, (3) identify outputs for which the activities are performed, and (4) assign activity costs to the outputs. Each of the steps is briefly explained below.

(1) Identify activities. This step requires an in-depth analysis of the operating processes of each responsibility segment. Each process may consist of one or more activities required by outputs. Activities may be classified into unit-level, batch-level, product sustaining, and facility sustaining activities.{Footnote 39] Management may combine related small activities into larger activities to avoid excessive costing efforts.

[Footnote 39: Cooper, Kaplan, et. al., page 20.]

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

(2) Assign resource costs to activities. This step assigns resource costs to the activities identified in step 1. The resource costs include direct and indirect costs usually recorded in general ledger accounts. Depending on feasibility and cost-benefit considerations, resource costs may be assigned to activities in three ways: (a) direct tracing; (b) estimation based on surveys, interviews, or statistical sampling; or (c) allocations.

(3) Identify outputs. This step identifies all of the outputs for which activities are performed and resources are consumed by a responsibility segment. The outputs can be products, services, or customers (persons or entities to whom a federal agency is required to provide goods or services). Omitting any output would result in overcharging costs to other outputs.

(4) Assign activity costs to outputs. In this step, activity costs are assigned to outputs using activity drivers. Activity drivers assign activity costs to outputs based on individual outputs' consumption or demand for activities. For example, a driver may be the number of times an activity is performed in producing a specific type of output (the transaction driver), or the length of time an activity is performed (the duration driver).

150. ABC can be used in conjunction with job order costing or process costing. For example, making direct loans to the public involves a series of processes, such as loan origination, credit review for individual applicants, preparing loan documents, valuation of collateral, making loan disbursements, computing fees and periodic payments, keeping records, and making collections. These are the "first category" activities that directly affect individual loans. ABC can be applied to this category of activities.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

151. The direct loan operations also involve "second category" activities, such as those performed by loan officers to review and assess a portfolio of loans and make policy changes that affect an entire portfolio. If ABC is not used, the costs of the loan officers may be allocated to direct loans based on the number of loans disbursed, or based on the staff hours spent on processing all the loans. However, such an allocation tends to be arbitrary, because some loans require more of their time than others. Under ABC, the costs of loan officers would first be assigned to their portfolio review and workout activities that they perform, then the activity costs would be assigned to the groups of loans for which the activities are performed.

152. A major advantage of using ABC is that it avoids or minimizes distortions in product costing that result from arbitrary allocations of indirect costs. By tracing costs through activities, ABC provides more accurate service or product costs. Experience in the private sector shows that by providing accurate cost measures, ABC has helped improve product costing, strategic pricing, and profit planning.

153. Also important is that ABC encourages management to evaluate the efficiency and cost-effectiveness of activities. Some ABC systems rank activities by the degree to which they add value to the organization or its outputs. Managers use such value rankings to focus their cost reduction programs. ABC encourages management to identify and examine (a) what activities are really needed (value-added activities) in order to accomplish a mission, deliver a service, or meet customer demand, (b) how activities can be modified to achieve cost savings or product improvements, and (c) what activities do not actually add value to services or products (non-value-added activities). ABC integrates with cycle time analysis and value-added analysis.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

Job order costing

154. Job order costing is a costing methodology that accumulates and assigns costs to discrete jobs. The word "jobs" refers to products, projects, assignments, or a group of similar outputs.

155. Each job has a number or code to accumulate costs. Resources spent are identified with the job code. Costs are traced to individual jobs to the extent economically feasible. Costs that cannot be directly traced are assigned to jobs either on a cause-and-effect basis or allocation basis.

156. Job order costing is appropriate for responsibility segments that produce special order products, or perform projects and assignments that differ in duration, complexity, or input requirements. Typical situations in the federal government in which job order costing would be appropriate are legal cases, audit assignments, research projects, and repair work for ships, aircraft, or vehicles.

Process costing

157. Process costing is a method that accumulates costs by individual processing divisions (organization divisions that perform production processes). These processing divisions are involved in a continuous production flow, with each division contributing towards the completion of the end products. The output of a processing division either becomes the input of the next processing division or becomes a part of the end product.

158. Each division accumulates costs, assigns the costs to its outputs, and calculates the unit cost of its output. For each period, divisions prepare a cost and production report, showing the costs, the completed units, and the work-in-process volume. When a certain number of completed units are transferred from a division to the next

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

division, the costs of those units are also transferred and are eventually incorporated into the costs of the end product. Thus, the cost flow follows the physical flow of the production. The unit cost of the end product is the sum of the unit costs of all the divisions.

159. Process costing is appropriate for production of goods or services with the following characteristics: (a) the production involves a regular pattern of process, (b) its output consists of homogeneous units, and (c) all units are produced through the same process procedures. In the private sector, process costing is used by such industries as flour mills, steel foundries, oil refineries, and chemical processing plants. In government, it may be used by some activities that involve repetitive process procedures to deliver a large volume of similar goods or services. An example would be making entitlement benefit payments, which involves a series of consecutive processes for reviewing applications to establish their eligibility, computing the amount of benefits, and issuing checks.

Standard costing

160. Standard costs are carefully predetermined or expected costs that can be applied to activities, services, or products on a per unit basis. Horngren describes standard costing as follows:

"A set of standards outlines how a task should be accomplished in nonfinancial terms (minutes, board feet) and how much it should cost. As work is being done, actual costs incurred are compared with standard costs for various tasks or activities to reveal variances. This feedback helps discover better ways of adhering to standards, of altering standards, and of accomplishing objectives."[Footnote 39]

[Footnote 39: Horngren, Charles T. and George Foster, Cost Accounting, A Managerial Emphasis, 7th ed. (Prentice Hall, Englewood Cliffs: New Jersey, 1991),

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

page 222.]

161. Many organizations frequently review and update the standards to assure that they encourage improvements in efficiency and are within an attainable range.

162. Standard costing helps managers to formulate budgets, control costs, and measure performance. It can be used in conjunction with job order costing, process costing, and activity-based costing. It can be applied to specific outputs or activities, and it can also be applied to a responsibility segment in aggregate by comparing total actual costs with total standard costs based on outputs produced within a certain time period. Typical situations in the federal government in which standard costing would be appropriate are operations that produce services or products on a consistently repetitive basis. Agencies are encouraged to use standard costing in those situations.

****

APPENDIX A:
BASIS FOR CONCLUSIONS

The Nature of Concepts and Standards

163. The difference between accounting concepts and standards is significant. Statements of concepts are more general than statements of standards. Standards are intended to be specific guidance and authoritative in nature. Concepts generally do not contain specific recommendations that would, when issued by the Board's sponsors, become authoritative requirements for federal agencies. Concepts, instead, provide general guidance both to the Board and others. They are also intended to help preparers and users of financial information better understand federal accounting and financial reporting. While the differences can be easily stated, in reality the line between concepts and standards is often broad

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

and presents many gray areas for interpretation.

164. When the Board began the project on managerial cost accounting, it anticipated the issuance of a recommended Statement of Concepts. Given the meager use of cost accounting within many federal agencies, a Statement of Concepts would provide both the Board and preparers of federal financial reports with overall guidance in the area and an indication of the future direction the Board might take in developing standards. However, as the Board and staff began working on the project, it became clear that action was needed to recommend standards for the development of cost information.

165. Cost accounting standards were needed because users of financial information, especially taxpayers and members of Congress, began putting more emphasis on the cost of government programs, products, and activities. The efforts to reduce government spending, control the deficit, and improve government functions necessitated information about the true costs of government. In addition, passage of the CFO Act and the GPRA required agencies to provide cost information as a part of improving their financial management and reporting. Furthermore, the NPR issued a recommendation that the Board move rapidly to recommend cost accounting standards.

166. The Board established the Cost Accounting Task Force to provide advise and guidance on the cost accounting project. On the task force were many individuals knowledgeable about cost accounting in the private sector as well as the limited federal cost accounting activities. The task force also recommended the establishment of cost accounting standards.

167. The Board issued the exposure draft as a recommended statement of standards. The Board knew, however, that since cost accounting is relatively new in the federal environment, the final statement necessarily would contain some conceptual material. Although the exposure draft

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

did not present any direct questions concerning whether parts of the draft should be viewed as concepts, the issue did arise in public hearings held in November 1994, and January 1995. In addition, a few respondents who mailed in their comments addressed the point.

168. Most of those commenting on the issue stated that they viewed the exposure draft as being somewhat conceptual in nature. Many of those thought that this was appropriate and supported the document and the conceptual material it presented. A few respondents were concerned about the ability to audit some of the standards because of the conceptual nature of the document. Several suggested that the final statement be segregated into concepts and standards and both be issued in one statement.

169. The Board decided that some parts of the final statement would contain information that should be presented as concepts while other parts would be better presented as standards. Therefore, the final statement should be a "hybrid" issuance containing both concepts and standards. The title of the document was changed to "Managerial Cost Accounting Concepts and Standards for the Federal Government." (The Board decided that the material presented in the exposure draft as the first standard that addressed the relationship among managerial cost accounting, financial reporting, and budgeting should be presented as concepts. The other materials were more in the nature of standards.)

Relationship Among Cost Accounting, Financial Reporting, and Budgeting

170. The Board considers it important for financial preparers and users of financial reports to understand the relationship of cost accounting to the more traditional areas of general financial accounting, financial reporting, and budgeting. It views cost accounting as a basic and integral part of an entity's financial management system.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

Therefore, the Board included a standard on this relationship within the exposure draft.

171. The standard addressed the role of managerial cost accounting in financial management and explained how it provides cost information relevant to budgeting, financial reporting, management control, and many decision making processes. The standard discussed the use of a common data source for cost accounting, financial accounting, and budgeting. It explained how the costs may be determined using different bases of accounting and different recognition and measurement methods depending upon the intended use of the information. It also emphasized the need for reconciliation of cost data which may be presented differently in various financial reports. The standard stated that all cost information, regardless of how presented, should be traceable back to the original common data source.

172. Most exposure draft respondents who provided comments on this standard stated that the level of detail presented was about right given the desire of the Board to address cost accounting at a high level. Most respondents agreed with the need to draw cost accounting data from a common data source that is also the source of financial and budgetary data. Some respondents were concerned that the use of the term "data source" was too closely allied with automated or computerized operations and that the term may be misinterpreted. The Board, however, believes that the term is adequately explained. In fact, the exposure draft clearly stated that this term was not meant to imply the use of computerized systems for source information.

173. Data reconciliation for reports containing cost information developed on different bases of accounting or using different recognition or measurement methods received overwhelming support from respondents to the exposure draft. They said that the ability to reconcile differing cost information is necessary to ensure data integrity,

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

avoid confusion on the part of financial statement users, and support stewardship responsibilities.

174. Many who commented on whether the exposure draft should be viewed as a statement of concepts or a statement of standards implied that this particular standard on relationships of cost accounting to other financial management functions was basically conceptual in nature. The Board agreed and concluded that this section is more in the nature of an explanation of how cost accounting provides useful information and how it fits in with the overall financial management system as opposed to a standard which places a requirement on an entity. The Board decided that this material would be better presented in the final statement as recommended concepts.

Requirement for Cost Accounting

175. The cost accounting task force recommended that a standard be included in the exposure draft requiring each reporting entity to establish cost accounting systems and procedures for its activities. They believed this was necessary to ensure the generation of required cost information.

176. The Board agreed to include the standard in the exposure draft. The standard defined "system" in a broad way as simply an organized grouping of methods and activities designed to consistently produce reliable cost information. The explanations and discussions section of the exposure draft contained information on several factors that would help managers decide how complex and sophisticated their cost accounting system should be. It noted that the system could be constrained by the (1) nature of the entity's operations, (2) precision needed in cost information, (3) practicality of data collection and processing, (4) availability of electronic data handling, (5) expected cost of the system itself, and (6) any specific management information needs.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

177. The exposure draft also listed ten minimum criteria that should be met by all managerial cost accounting systems. Four of these were related directly to the other standards in the exposure draft (responsibility segments, full costing, costing methodology, and unused capacity costs). The six remaining criteria were concerned with ensuring that the cost data produced was reliable, consistent, and useful. These criteria were (1) ensuring the ability to assist in measurement of performance, (2) reporting information on a timely and consistent basis, (3) integrating cost accounting with the standard general ledger, (4) determining a reasonable and useful level of data precision, (5) accommodating special information needs of management, and (6) documenting the system through a manual or handbook. The standard also allowed for the use of cost finding techniques and special cost studies or analyses.

178. A large number of respondents to the exposure draft supported the requirement for cost accounting systems. They stated that such a requirement is necessary to ensure that appropriate cost data are recorded. They also said that having a requirement for cost systems will help agencies to more easily meet the requirements of the CFO Act and the GPRA. Some qualified their support by stating that the standard should allow an exemption for small entities since establishment of a full cost accounting system may not be cost-beneficial to them. The Board decided that such an exemption would be inappropriate since the standards should apply to all federal activities. Furthermore, it should be far easier for small entities to perform managerial cost accounting in most cases.

179. Those who were negative toward the standard provided several reasons. Several expressed concern about whether accounting standard-setting bodies should require or determine how accounting data are produced. They noted that other accounting standard-setting organizations have stated only what information is required and how that information is displayed in financial

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

statements, not how the information is developed.

180. The Board believes that it should not be constrained by what other standard-setters do. Other standard-setters so far have concerned themselves mainly with entities' external reporting. This is understandable because their mission is to assure that the financial position and results of operations are presented in a fair, reliable, and consistent manner to financial statement users who are external to the reporting entity.

181. FASAB is different in that it has determined that some of the users of federal government financial reports are internal to the government. Given the nature and size of the federal government, internal users often do not have the same type of access to cost information that may be available in commercial enterprises. In addition, the Board views cost accounting information as vital to both internal and external users. The Board has previously determined in its Objectives of Financial Reporting that cost information should be reported to meet the needs of Congress, federal executives, and others.

182. Some respondents to the exposure draft were concerned that the requirement for a cost accounting system, along with the system criteria, would not allow management enough flexibility. They seemed to consider the requirement for a system to mean that cost accounting activities had to be automated with computers and that software had to be developed and employed in a "full-blown" system, as one put it. They believe that such an elaborate system may not be needed in some cases where informal procedures or methods would suffice.

183. The Board does not intend to prescribe an elaborate managerial cost accounting system for every federal organization. It believed that the standard proposed in the ED was sufficiently broad to allow managerial flexibility in the system design. However, the Board does recognize that

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

the term "system" may connotate to some a requirement for computerization and sophisticated methodologies.

184. Others stated that establishing the requirement for cost systems should be the responsibility of OMB or JFMIP. Some of the respondents were concerned about the degree to which the standard may overlap with JFMIP's responsibility to set requirements for cost accounting systems. The NPR recommends setting requirements for cost accounting systems as a responsibility of JFMIP, while asking the Board to provide the cost accounting standards.[|fOOTNOTE 40]

[Footnote 40: Office of the Vice President, Improving Financial Management, Accompanying Report of the National Performance Review (September 1993), page 24.]

185. The Board proposed the requirement for systems to ensure that cost information is produced and reported in a reliable and consistent manner, and emphasized that this was the intent. The point is not whether the information is produced through the use of a system or through other techniques. The Board believes that, in many cases, cost accounting systems will be established as a natural consequence of requiring cost information. Many government agencies are very large and complex organizations, and it is unrealistic to think that they can develop cost data without relying on a system to do so. Other small agencies or reporting entities may not need a system to develop cost data in a regular, consistent, and reliable manner.

186. The Board, therefore, changed the standard to emphasize producing cost accounting information in a reliable and consistent manner. This can be done through the use of cost accounting systems or cost finding techniques. In either case, the main intent of the original standard is preserved. In addition, the concerns expressed over whether the Board or some other organization should establish

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

the requirement for cost "systems" are solved.

Responsibility Segments

187. As stated in the ED, a responsibility segment is a component of a reporting entity that is responsible for carrying out a mission, conducting a major line of activity, or producing one or a group of related products or services.

188. The proposal for using responsibility segments in the ED was based on the view that most federal departments and agencies are engaged in more than one line of activity, or producing more than one type of service or product. Furthermore, the activities that an agency performs may differ from each other significantly in required resources and operations. The ED used the Department of Veterans Affairs (VA) as an example. Among its activities, VA administers hospitals and nursing homes to provide health care to veterans, and it also administers direct home loan and loan guarantee programs. These lines of activities are significantly different in operation patterns. The Board believes that for entities that are engaged in diverse activities, identifying responsibility segments is necessary for identifying resources consumed by a distinct line of activity with the outputs of that activity.

189. A majority of respondents supported the requirement for responsibility segments and agreed with the advantages of the requirement. They expressed the view that segmentation provides a basic framework to trace and assign costs to outputs. They also believed that segmentation provides management with the flexibility of choosing a costing methodology that is best suited for a line of activity. The respondents also stated that information generated by responsibility segments can be used to measure performance and to assess accountability.

190. Several respondents, however, presented arguments against using responsibility segments. One such argument was that responsibility segments

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

would constitute an unnecessary layer that conflicts with financial reporting and budgeting systems. The Board disagrees with this view. A responsibility segment is not, and should not be, an additional layer to the organization and the budget structure. It is an accounting mechanism to capture data generated in operations by various components of an organization in its existing structure. Organization and budget structures can be changed for better management but not for the sake of accounting. Accounting may influence but cannot dictate such changes.

191. The Board believes that accounting by segment will help provide information useful to program managers and other users of financial reports. Entity-wide financial reports provide information on the overall financial position and operating results of an entity in aggregate. Such reports, although useful for many purposes, are not sufficient for cost management. A fundamental undertaking of managerial cost accounting is to match costs with activities and outputs. The purpose of segmentation is to segregate entity-wide data by major lines of activities and their outputs. Information related to each segment should tell managers and other users of financial reports about the segment's specific outputs, the activities performed, and resources consumed to produce the outputs.

192. Furthermore, segment-based reporting need not be in conflict with entity-wide financial reporting. They can use a common source of data, such as accounting data collected by the standard general ledger or the budget execution reports. To perform segment-based accounting and reporting, the general accounting or budget execution data can be traced and assigned to segments. The Statement of Federal Financial Accounting Concepts No. 2, Entity and Display, discusses a reporting approach similar to the segment-based accounting and reporting:

"With some organizations, and even suborganizations, the activities of one or

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

more programs or other components are as important to the readers of financial statements as are activities of the entity as a whole. This would be particularly true for a department composed of many bureaus, administrations, agencies, services, etc., and particularly if their programs are dissimilar. In those instances, consideration should be given to the preferability of reporting the assets, liabilities, revenues, expenses, etc., of both the significant components individually and of the entity in its entirety."[Footnote 41]

[Footnote 41: FASAB Statement of Recommended Accounting Concepts 2, Entity and Display, par. 75, page 25.]

193. Another argument against requiring responsibility segments was that the requirement is overly prescriptive and would constrain agency management from selecting among various cost collection methods. The Board believes the standard gives management adequate flexibility in structuring cost accounting. As the standard states, it is for the management of each entity to decide how segments should be defined, and how similar products and services can be grouped into one segment.

194. Furthermore, segments are the largest components of an entity. Management has the flexibility to use any cost collection method within each segment. Within a segment, management may define sub-units, functions, projects, business processes, activities, or a combination of them as cost centers to accumulate costs. The costs accumulated at lower levels can then be aggregated to the segment level.

195. In fact, a segment may contain multiple levels of responsibility or cost centers. For example, if veterans health care is defined as one of the DVA's responsibility segments, this segment may define its hospitals, clinics, and nursing

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

homes as responsibility centers. Each hospital, clinic, and nursing home may further define their functional units, activities, or business processes as cost centers.

196. Some respondents correctly pointed out that requiring broad responsibility segments, rather than prescribing traditional cost centers, provides opportunity for entities to use activity-based costing or any other costing methods that they may find appropriate.

197. Several respondents who supported the use of responsibility segments interpreted the wording of the proposed standard as requiring that each segment perform managerial cost accounting. They pointed out that for some entities, it is more effective and economical to perform centralized managerial cost accounting. Such centralized accounting is capable of accumulating costs by segments and assigning costs among them. The respondents requested that the wording be revised to provide this flexibility.

198. The Board agrees with this request. The Board believes that entity management should have the discretion to decide whether managerial cost accounting is performed at the entity or segment level, so long as the segment cost information is provided to managers and other users. Thus, the standard recommended in this statement does not require that responsibility segments perform managerial cost accounting.

Full Cost

199. As stated in the ED, the full cost of an output produced by a responsibility segment is the sum of direct and indirect costs that contribute to the output, including the costs of supporting services provided by other segments and entities.

200. The outputs of a responsibility segment are considered as cost objects.[Footnote 42] However, in most circumstances, the full costs of intermediate objects, such as activities,

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

processes, projects, programs, or organization units, must also be measured in order to derive the full costs of their outputs. (See ED Par. 173) The full cost information related to outputs as well as those intermediate objects are useful in measuring efficiency and cost-effectiveness.

[Footnote 42: "Cost object" is defined as an activity, output, or item whose cost is to be measured. In a broad sense, a cost object can be an organizational division, a function, task, product, service, or a customer. See Glossary.]

Usefulness of full cost information

201. Program evaluation and authorization. Most respondents supported the full cost standard. They recognized that it is particularly important to determine and report the full cost of a program. Information on full costs of programs can be used in program evaluations. Such evaluations typically relate the full costs of programs to their outputs and outcomes. Decision-makers in the Congress and the federal government at all levels as well as the public should be provided with information on the full costs of programs and their outputs. The full cost information, when used with information on program outputs and outcomes, can aid the Congress and federal executives in making decisions on program authorization and modifications.

202. Cost awareness. Most respondents also agreed that the standard has the advantage of promoting cost awareness. Entity and segment managers should be aware of the costs that are incurred or assigned to their operations. Without the awareness, managing and controlling costs are impossible. The full cost information has not been available and will not likely to be without an accounting standard requiring it.

203. Setting fees and prices for government goods and services. Many respondents agreed that full cost should be considered as a primary basis for setting fees and reimbursements for government

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

goods and services. As pointed out in the ED, it is a federal policy that, with certain exceptions, user charges (prices or fees) should be sufficient to recover the full cost of goods, services, and resources provided by the federal government as sovereign.[Footnote 43] The policy further states that when the government sells goods and services under business-like conditions rather than in a sovereign capacity, user charges should be based on market prices and may yield a net revenue in excess of the full cost. The objectives of the policy are to: (1) ensure that government goods and services are provided on a self-sustaining basis, (2) promote efficient allocation of national resources, and (3) allow fair competition with comparable goods and services provided by the private sector.

[Footnote 43: OMB Circular No. A-25, User Charges.]

204. To implement the policy, full cost information is necessary. Only with reliable full cost information can management ensure that user charges fully recover the costs.[Footnote 44] Even in some exceptional cases in which user charges are exempted or restricted by law, agencies that provide the goods and services would nevertheless need the full cost information to assess the extent to which costs are not recovered.

[Footnote 44: The standard of determining full cost discussed in this document, however, should not be construed as a standard for setting fees, prices, and reimbursements. Federal entities should comply with laws and regulations related to pricing policies in general and for specific types of goods and services. Those laws and regulations (including OMB Circular A-25) may prescribe costing requirements other than the full cost standard discussed in this document. Full cost defined by this standard can serve as a point of reference for managerial decisions. However, it is not intended to supersede any costing concept that management is required or permitted by law to use in pricing goods and services.]

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

205. Making cost comparisons. Respondents agreed that the full cost of outputs provides a valid basis for cost comparisons. One of them emphasized the importance of calculating the unit cost of output on the full cost basis. The Board agrees with his view. If an output can be measured in units, its unit cost should be calculated on the full cost basis.

206. The unit cost of a service or product, calculated on a full cost basis, can be compared with a similar service or product produced by other entities either in the federal government or in the private sector. The comparison would not be valid if it is not conducted on a full cost basis.

207. One of the available cost management tools is trend analysis. In trend analysis, unit costs of a service or product over a number of consecutive periods are examined to find a trend of increases or decreases. This analysis can be valid only when the unit costs of all periods are measured on a consistent basis, such as the full cost basis. When the full cost basis is used, the analyst can further examine the components of the unit cost, such as direct labor and material costs, overhead costs, and costs of services received from other segments or entities. Through examining the various components of the full unit cost, program managers can pinpoint specific areas that contributed to cost increases or decreases.

208. If activity-based costing is used, the cost components would be associated with activities. The trend analysis for activity-based cost components can provide information related to the efficiency of the activities. Managers can also analyze the extent that the individual activities add value to program outputs and objectives.

Limitations of Full Cost Information

209. Several respondents cautioned the Board against "uncritical advocacy" of full costs. They pointed out that full cost is not relevant to all decision-making situations. They explained that

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

some decisions require other cost concepts such as variable, differential, or incremental costs. Thus, some of them said that the Board should not singularly emphasize full cost.

210. The Board is aware of the notion that different cost concepts should be used for different purposes so that the use of a cost concept is relevant to a particular decision-making purpose. For this reason, the Board discussed the limitations and usefulness of full cost in the ED at length. (See ED pars 133 through 146.) Quoting from Anthony and Young, the ED pointed out that full costs are not appropriate for alternative choice decisions such as the decision to (1) add or drop a product or service, (2) perform work in-house or contract out for it, and (3) accept or reject a special request. For these decisions, the appropriate information is differential costs.[Footnote 45]

[Footnote 45: Robert N. Anthony and David W. Young, Management Control in Nonprofit Organizations, 5th ed. (Burr Ridge, Illinois: Richard D. Irwin Co., 1994) page 235.]

211. However, the full cost standard is an accounting standard, rather than a cost analysis or decision-making standard. It requires that full cost information be compiled and reported through cost accounting. In no way does it limit cost analysts and decision-makers to the use of full cost alone in all situations. The Board believes that when the full cost information, instead of any portion of it, is made available, analysts and decision-makers will have a comprehensive data source to develop the cost concepts that they need in their analyses.

212. Some respondents pointed out that full cost requires a complex process of cost assignments and allocations. The Board believes that the assignment of indirect costs is a necessary procedure to obtain full cost. It can be performed through an appropriate costing methodology. As discussed in the costing

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

methodology section of the ED, some modern costing methodologies are available to make rational and reliable cost assignments. However, the Board must caution that the full cost information, like any other accounting information, can only be as good as how it is prepared. For example, it can be unreliable or inaccurate, if arbitrary or irrational cost allocations are used excessively. Thus, the Board recommended a costing methodology standard. Program managers should critically review costing methodologies and techniques used to derive the cost information.

Inclusion or Exclusion of Certain Costs

213. A number of respondents were opposed to the inclusion of accrued employee benefit costs and costs of services provided by other entities that are not reimbursed. (The subject of inter-entity costs will be discussed in the next section.) They argued that these costs are not funded with their budgetary resources and are beyond their control. A large portion of employee benefit costs, including accrued retirement benefit costs, are funded through appropriations to trust funds managed by OPM and DoD. The Board believes that as a principle, full cost should include the costs of all resources applied to a program, activity, and its outputs, regardless of funding sources. For financial reporting, the Board has stated its position that the full costs of employee pension and other retirement benefits determined on an actuarial basis, including the amounts that are funded to the trust funds directly, should be recognized as an expense in the employer entity's financial reports.[Footnote 46] The Board does not find a good rationale to depart from this principle in managerial costing.

[Footnote 46: FASAB Exposure Draft, Accounting for Liabilities of the Federal Government (Nov. 1994), pars. 80-99, pages 32-46.]

214. The ED states that some costs should be recognized as a period expense rather than the costs of goods and services (output costs).

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

Examples include the costs of "other post employment benefits" (OPEB), reorganization costs, and acquisition costs of Federal "mission" and "heritage" property, plant, and equipment which are recognized as expenses at the time of acquisition.[Footnote 47] These costs will be recognized as expenses for the period in which the related events take place, and are referred to as "period expenses." The ED explained that since these expenses do not contribute to the outputs of the period in which they are incurred, they should not be included in the output costs.

[Footnote 47: "Federal mission PP&E" and "heritage assets" are explained in FASAB Exposure Draft, Accounting for Property, Plant, and Equipment (February 28, 1995), pars. 98-115, pages 29-33.]

215. The OPEB costs, for example, may be recognized as expenses for a period in which a reduction in force or an employee injury takes place.[Footnote 48] It is not appropriate to attribute the entire OPEB costs to the output costs of that period. Several respondents expressed the view that OPEB costs should be included in full cost. There is no doubt that OPEB costs, as well as other period expenses, are part of the full cost of an entity or a program. They may also be part of the full costs of outputs over many years in which the employees contributed to the production of the outputs. However, they are not the production costs for the period during which they are incurred. Thus, the Board concluded that in cost studies, management may distribute some of the period expenses, such as OPEB costs, to outputs over a number of past periods if (a) experience shows that the OPEB costs are recurring in a regular pattern , and (b) a nexus can be established between the OPEB costs and the outputs produced in those past periods. The Board finds no reason to change this position.

[Footnote 48: FASAB Exposure Draft, Accounting for Liabilities of the Federal Government (Nov. 7, 1994), pars. 100-102, pages 47-48.]

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

216. Some respondents contended that full cost should include unused capacity costs. As will be explained in a later section on unused capacity costs, the Board has decided not to recommend a standard on measuring unused capacity costs. Thus, to assure valid cost comparisons, full costs should not exclude unused capacity costs.

Controllable and Uncontrollable Costs

217. Some respondents believed that the managers of a responsibility segment should be held accountable only for costs that they can control, and their performance should not be evaluated for costs beyond their control. They found that the full cost reporting would obscure the distinction between controllable and uncontrollable costs. For performance measurement or other purposes, some entities may want to make a distinction between controllable and uncontrollable costs with respect to an individual responsibility segment or a cost center. The full cost information need not interfere with this distinction. This standard does not require the use of full cost for internal reports. If some entities choose full cost for internal reporting, the internal reports can provide a distinction between controllable and uncontrollable costs with respect to individual segments.

218. Ultimately, most costs are controllable at a certain level of the entity. If some of them are not controllable at a lower level of the organization, they may very well be controllable at a higher level. Each segment should concern itself with the costs that are assigned to it on a cause-and-effect basis. These costs are often incurred because of a segment's demand and use of services from other segments or entities. Although the service-receiving segment has no control over the efficiency in producing the service, it can influence the costs by changing the demand for the service. For an entity's top management, full cost reporting provides it with an overview of how the entity's various costs, including the general and administrative costs,

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

are incurred and assigned to the entity's segments. The full cost reporting also makes the entity's top management aware of the costs of services that it receives from other entities. The management can closely review those costs and determine whether actions are needed to control them.

Centralized Accounting

219. The proposed standard in the ED states that "Responsibility segments should be capable of measuring the full costs of their outputs." Several respondents stated that the full costs of segments, programs, and their outputs can be more effectively measured by entities through centralized accounting, rather than by individual segments. They further stated that it would not be cost-beneficial for segments to measure and report the full costs of their activities and outputs on a regular basis (such as monthly basis). The Board agrees that many entities may find it more economical and effective to measure full costs through centralized accounting. Moreover, the Board believes that it should be for entity management to decide as to how frequently the full cost information should be made available in its internal reports. Thus, the wording of the standard has been changed. The full cost requirement is now limited to external reporting via general purpose financial reports.

Costs of Outcomes

220. A respondent suggested that in addition to the full cost of outputs, the standard should also require reporting the full cost of program outcomes. As discussed in the ED, the Board believes that performance measurement of a program requires three major elements: the full cost of the program, its outputs, and its outcomes. (See ED pars 37 and 38) The full cost of a program and its outputs, once measured according to this standard can be related to the outcome of the program to measure its cost effectiveness.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

221. This standard does not require a direct measurement of the cost of outcomes because in most instances, program outcomes need to be measured with methodologies beyond those discussed in this document. GPRA defined "outcome measure" as an "assessment of the results of a program activity compared to its intended purpose."[Footnote 49] Many programs' policy objectives and intended results are socio-economic or scientific in nature, or involve national defense. The assessment of the program results require expert knowledge in those areas. Thus, unlike costs and outputs, outcomes are not always measured in quantitative or monetary terms.

[Footnote 49: The Government Performance and Results Act of 1993, PL 103-62, sec 4.]

222. Moreover, unlike costs and outputs that are measured for each accounting and reporting period, such as a quarter or a year, outcome measurement may be long-term in nature. For example, the Senate Report on GPRA states that "Outcome measurement cannot be done until a program or project reaches a point of maturity (usually at least several years of full operation for programs continuing indefinitely) or at completion." Although all programs cost money, some of them may produce positive results, while others may produce no results or negative results.

223. Because of the complexities in measuring outcomes, the costing principles and methodologies discussed in this document cannot be used to measure the cost of outcomes. The Board believes that the full cost of a program and its outcome should be measured independently, using methodologies appropriate to costs and to outcomes. Once each of them is measured, they can then be related to review the cost-effectiveness of the program.

Inter-Entity Costs

224. It is not unusual in the federal government for one agency to provide goods or services to

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

another agency. Sometimes this may be required by law, and often it is a very efficient method of conducting business for the agencies involved and for the government as a whole. In many cases, the agency receiving such goods or services will reimburse the providing agency in accordance with some agreed-upon price. Often, however, there is no charge, or there is a charge that is not sufficient to cover the providing agency's full cost. When such "free" or lower-than-cost items are used in the production of the receiving agency's outputs, the result can be an understatement of the full cost of final outputs by the receiving agency.

Survey of Non-Reimbursed Costs

225. The Board recognized that these non-reimbursed or under-reimbursed goods and services could distort the determination of a reporting entity's full cost of outputs, but it was uncertain of the extent to which this occurs. To identify examples of non-reimbursed inter-entity costs, the Board conducted a limited survey of federal agencies. Of the 22 agencies responding to the survey request, 13 indicated that they provide some type of service or good that is not reimbursed. These covered a wide range of activities, but most of the costs involved were for salaries and salary-related benefits of those employees performing the work. In most cases, the costs were funded through direct appropriations to the providing agencies; however, those agencies could not specifically identify the total amounts involved. Several provided estimates, which ranged from $360 thousand dollars per year to about $180 million per year. Several examples of non-reimbursed inter-entity activities identified in the survey are listed below by providing entity:

-- Department of Agriculture -- Provides market data, pesticide data, food specification information, water supply forecasts, and

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

other agricultural information. Thirty-six federal agencies regularly receive all or some of this information.

-- Department of Commerce -- Provides accounting and grant administration services, computer access and reports, and consultation services to several agencies.

-- Department of State -- Provides space and facilities for other agencies in its buildings in the U.S. and overseas.

-- General Services Administration -- In some cases, it provides policy and regulatory development services, property management services, and contract award and administration to other agencies without reimbursement.

-- National Science Foundation -- Administers a research grant program on engineering and computer science for the Department of Defense.

226. The Board noted that the survey was restricted to non-reimbursed costs between different agencies. As such, the results did not necessarily represent all of the kinds and amounts of transactions and costs between different reporting entities. The survey was also limited to those non-reimbursed costs which the agencies could easily identify in order to respond quickly to the questionnaire. Nevertheless, there were indications that some non-reimbursed costs may be significant in amount.

Usefulness of Recognition

227. Some respondents to the exposure draft stated that recognition of inter-entity[Footnote 50] costs would have limited usefulness for managers since they cannot control the cost of items provided by other agencies. In some circumstances, they cannot control the amounts of

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

inter-entity goods or services that must be used in the production of their outputs.

[Footnote 50: Full cost, as discussed in the full cost standard, contemplates both intra-entity costs and inter-entity costs applicable to a responsibility segment. This standard elaborates on inter-entity costs. Intra-entity costing is accomplished through the costing methodology selected for use within the reporting entity since these costs are passed among responsibility segments.]

228. The Board realizes that recognition of non-reimbursed or under-reimbursed inter-entity costs will not always have the same degree of usefulness for all levels of management. However, as stated in the standard on full costs, to fully account for the costs of the goods and services they produce, reporting entities will need to include the cost of goods and services received from other entities. Cost reduction and control, performance evaluation, and process improvement depend on knowledge of the full costs of producing outputs, including production costs incurred by other federal entities. These costs are most important for use by the entity's top-level management (and to a lesser degree by line managers) in controlling and assessing the operating environment and in making decisions about how best to acquire those goods and services. Knowledge of full cost, including the extent of inter-entity costs, is also important to external users, especially the Congress and taxpayers, in making decisions concerning various programs and allocating resources throughout the government.

229. In addition, the Board believes that, without the recognition of non-reimbursed and under-reimbursed inter-entity costs, the receiving entity has little incentive to control the use of these resources. While they may appear to be "free" to the receiving entity, the costs are absorbed somewhere in the government. If the receiving entity were charged for these costs, top-level management would then have more

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

incentive to economize and control the use of these resources as well as make better decisions concerning how and where to acquire them. This would help reduce overall costs to the taxpayer and provide the other benefits associated with full-costing by responsibility segment.

230. The recognition of all inter-entity costs is also important when an entity produces goods or services that are sold outside of the federal government. For the entity to recover the government's full cost on the sale, knowledge of the total cost, including costs incurred by other federal entities, is vital to the establishment of an appropriate price.

The Use of Estimates

231. The standard places the responsibility on the providing entity to supply the receiving entity with information on the full costs of non-reimbursed or under-reimbursed inter-entity goods and services. This is appropriate since only the providing entity is likely to have such information. Implementation of the standard on full costing should make this requirement fairly easy for the providing entity to fulfill. If, for some reason, the providing entity cannot or does not supply the cost information, the receiving entity has no way to recognize the costs other than through estimation.

232. The Board anticipated this possibility, and requires the receiving entity to use an estimate of the cost of those goods and services if the actual cost information is not provided. The estimate must be reasonable and should be aimed at determining realistic costs incurred by the providing entity. However, if such a cost estimate cannot be made, the receiving entity may base the estimate on the market value of the goods or services.

233. Some respondents to the exposure draft stated

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

that the use of estimates would be too problematic and unreliable and that the receiving entity would not have enough information to make the estimate. Some were concerned that the use of estimates would cause arguments between reporting entities over the cost. Others were concerned that some entities do not have experienced personnel to make such estimates. A few were concerned about the audit implications of using an estimate.

234. Some respondents expressed concern over the possible use of market values in making the estimate. Some of these respondents stated that government-type goods and services are not often produced outside government and, therefore, such market values may not exist. Others stated that market value does not always bear a direct relationship to true cost or that market values change too rapidly to be of any use.

235. The Board realizes the problems associated with the use of estimates. However, implementation of the other managerial cost accounting standards in this statement by the providing entities should considerably lessen the need for receiving entities to make estimates of inter-entity costs. The Board also believes that, if the inter-entity costs meet the recognition criteria established by the standard, and cost information is not received, then use of a reasonable estimate of cost is preferable to no recognition at all.

236. Estimates are often used in accounting and financial reporting. The recognition of cost based on estimation is not new and can be reliable so long as the estimate is reasonable and based on a rational and systematic method. The Board also realizes that the use of estimation necessarily implies the use of professional judgement. This does not negate the value of the estimate to users of the financial information and should not present a problem in relation to audit requirements.

237. The Board realizes that market values may

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

not always be available for many kinds of inter-entity goods and services. Nevertheless, if such values are available, they can be a good basis for estimating cost if no other basis can be established. Although market values may not be directly related to costs of production and they may fluctuate, they may also be viewed as a fairly reliable guide to the costs an entity might have to incur to obtain inter-entity goods and services from a non-governmental source. As with the determination of all estimates, use of market values as an estimation basis requires the use of judgement and professional care.

238. The Board also realizes that there may be some implementation problems such as disagreements with providing entities over an estimated cost or with the lack of trained personnel to make estimates. These problems are of a practical nature and can be resolved by management. In that regard, they are not unlike other problems faced when implementing any new or changed accounting standard such as making changes to systems and methods and training personnel on the new requirements. Both providing and receiving entities should work closely with each other to resolve any costing problems just as they would to solve any non-accounting related situations.

Recognition Criteria

239. It is clear to the Board that the recognition of each and every non-reimbursed or under-reimbursed inter-entity cost is not possible. The federal government is a very large and complex entity and it is normal to expect some flow of goods and services between its activities as a natural and reasonable method of completing missions and objectives. The Board decided that only certain non-reimbursed or under-reimbursed inter-entity costs should be addressed. The standard, therefore, includes criteria for recognition which will limit the application of the standard to only those items deemed most

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

significant and important.

240. The criteria address the materiality of the non-reimbursed inter-entity cost, whether it is a part of broad and general support for all entities, and whether it is needed to help determine a price to non-governmental entities. The materiality criterion considers materiality in the context of the importance of the item to the receiving entity. Under this criterion, whether an item of inter-entity cost is recognized depends upon three points. The first of these is significance to the receiving entity, i.e. whether the item is important enough that management should be aware of its cost in decision making circumstances. The second is the degree to which the goods or services are an integral and necessary part of the receiving entity's output. The third is the degree to which the good or service can be matched to the specific receiving entity with reasonable precision.

241. The criterion of broad and general support recognizes that some entities provide support to all or most other federal entities, generally as a matter of their mission. The costs of broad and general services should not be recognized by the receiving entity when no reimbursement has been made. However, if the service is an integral and necessary part of the receiving entity's operations and outputs, those costs should be recognized.

242. The criteria also recognize that there are certain cases in which inter-entity costs need to be recognized because there could be an effect upon a resulting price to a non-governmental entity. If a federal entity sells outputs to a non-federal entity, it is usually required to recover the full cost of those goods or services. While cost is not the sole determinant of final price, knowledge of the actual full cost of production to the government as a whole is necessary to ensure that the price is appropriately established at a level that will recover all costs.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

243. Most of the respondents to the exposure draft agreed with the recognition criteria. However, a few were concerned about how the criteria might be interpreted and whether the standards were too general in nature. The Board realizes that considerable judgement is required to apply these criteria and notes that the specific facts and circumstances in each case must be considered. This concern, along with other implementation concerns, led the Board to make certain decisions about implementation discussed below under "Implementation Issues."

Consolidation

244. The standard requires that, when non-reimbursed or under-reimbursed inter-entity costs are recognized, the receiving entity should recognize the full costs of the goods or services received as an expense (or asset) and, to the extent that reimbursement is less than full cost, the difference is to be recognized as a financing source. At the same time, of course, the providing entity would continue to recognize the full costs of goods and services provided, and any off-setting reimbursements, in its accounting records. Several respondents to the exposure draft were concerned about the possibility of "double-counting" of costs and others raised concerns about the ability to eliminate these transactions in consolidations.

245. Both the providing entity and the receiving entity are separate reporting entities. Each should recognize in its accounting records and financial reports the true costs of operations and any revenues received. The providing entity incurs a cost in providing the goods or services even though they are sent to another entity. It may also receive a partial payment or reimbursement. These transactions and events should be reflected in its accounting. The receiving entity, as a separate reporting entity, should also recognize its total cost of

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

production. The full cost of non-reimbursed or under-reimbursed goods or services ultimately contributing to its outputs should be reflected in the costs of production. To the extent that reimbursement is not made for those costs, the receiving entity is utilizing a separate source of financing, namely the providing entity. Again, this fact is reflected in the accounting. The result is that costs recognized but not actually paid are off-set by the imputed financing source. While the entity's financial position is not affected, the real costs of production are reflected.

246. The only possibility for "double-counting" of costs occurs when consolidated financial reports are prepared for a reporting entity that includes both the providing entity and the receiving entity. In preparing such statements, the standard calls for elimination of the inter-entity transactions. In effect, this is no different from the elimination of transactions for which full reimbursement has been made. The only additional transaction to be eliminated is the recognition of the imputed financing source by the receiving entity. The recognition of costs by both the providing entity and the receiving entity and any actual reimbursements would be eliminated anyway if payment for the inter-entity costs were made.

247. The Board realizes that identification and tracking of transactions that must be eliminated for consolidated reports can become complex and difficult. However, this is a practical implementation problem that management should be able to overcome through the use of transaction coding or some other identification method. It likely will require changes in methods and systems currently in use and may require additional training of personnel. The Board has decided upon a method to ease implementation problems as discussed below.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

Implementation Issues

248. As discussed above, the Board realizes that there may be problems in implementing the standard on inter-entity costing. Recognition of non-reimbursed or under-reimbursed inter-entity costs is a new concept to federal entities and involves

a new way of thinking about costs. There is concern that application of the standard may be inconsistent among federal entities. In addition, there could be problems, particularly at first, in developing estimates of costs; in revising accounting systems and procedures to accommodate these requirements; and in training personnel to accomplish the task. Furthermore, the Board recognizes the concern that some have about the elimination of inter-entity cost transactions for consolidated reporting since the accounting procedures may be complicated.

249. As a result of these problems and concerns, the Board has expressed the need to take a measured, step-by-step, practical approach to implementation of this standard. Therefore, the Board has decided that, in implementing the standard, it recommends that OMB, with assistance from the FASAB staff, should identify the specific inter-entity costs for entities to begin recognizing and OMB should then issue guidance identifying those costs. OMB should consider the requirements of the standard including the recognition criteria in developing the guidance and it should also consider suggestions and information provided by Treasury, GAO, and other agencies. The Board anticipates the largest and most important inter-entity costs will be identified first, followed by others as entities gain experience in the application of the standard. This approach is seen as a practical way to ensure uniformity in the application and implementation of the standard and to provide time and experience in overcoming any other practical problems which may arise. Also, the Board may recommend specific inter-entity costs for recognition in possible future recommended

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

standards.

Costing Methodology

250. The ED discussed cost accumulation and assignment principles. The ED states that costs should be accumulated by responsibility segments, and the accumulated costs should be classified by type of resource such as costs of employees, material, capital, utilities, rent, etc. The ED states that "The accumulation of costs by responsibility segments does not mean that each responsibility segment must have its own accounting system. The reporting entity may have a centralized accounting system, but the system should be capable of identifying costs with responsibility segments." (See ED par. 170)

251. The ED discussed three cost assignment principles: (a) directly tracing costs wherever feasible and economically practical, (b) assigning costs on a cause-and-effect basis, or (c) allocating costs on a reasonable and consistent basis. These principles apply to costs of services provided by a segment to other segments, as well as assigning costs to ultimate outputs of a segment.

252. The ED then provided brief descriptions of available costing methodologies: activity-base costing (ABC), job order costing, process costing, and standard costing. The ED pointed out that these costing methodologies are not mutually exclusive. For example, standard costing can be used within ABC. ABC and standard costing combined can then be used with either job order costing or process costing.

253. Most respondents believed that the requirement for cost accumulation by responsibility segment is appropriate. Some of them stated that costs are accumulated at levels lower than segments such as cost centers, processes, or activities within a segment. Such accumulation is consistent with the standard so long as the costs will be aggregated at the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

segment level. Some of the respondents stated that the requirement is currently feasible because their systems are designed to accumulate expenses by segments and by resource types. Others, however, stated that they must upgrade their general accounting systems in order to meet the standard requirement.

254. All the respondents agreed with the cost assignment principles. One respondent, while supporting the principles, stated that the principles should be explicitly ranked by preference. The Board intended to express an preference among the principles. It stated in the proposed standard that direct cost tracing should be used "wherever it is feasible and economically practical." The Board further stated in the ED that "for the costs that are not directly traced to outputs, it is preferable that they be assigned to them on a cause-and-effect basis." (See ED par. 182) However, for cost-benefit considerations, assigning costs by allocations cannot be avoided. The Board emphasized that cost allocations should be performed on a rational basis. It also cautioned that allocations can be arbitrary and thus may result in distortions. (See ED par. 190) To make the intent of preference more explicit, the Board has added words to the standard to indicate that the principles are listed by preference.

255. All the respondents approved the descriptions
of available costing methodologies. Some of them stated that the materials included are clear and provide adequate guidance. The respondents agreed with the Board's position that because federal activities are highly diverse, it is not practical to require a particular costing method for a particular type of activity at this time. However, it is appropriate to require that each entity select a costing methodology that is best suited to its operations and use that methodology consistently.

256. The Board encouraged government entities to

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

study the potential use of ABC in their operations (ED par. 200). This was well received by the respondents. Eighteen respondents supported ABC. Most of them said that ABC can be effective when combined with any of the other costing methodologies. Seven respondents from federal agencies stated that they believed ABC is appropriate for their activities and were considering using it. In addition, two respondents stated that the use of standard costing should also be encouraged. The Board continues to believe that as federal agencies are going through stages in the development of their managerial costing, more sophisticated and refined costing methods, such as ABC and standard costing, should be considered and used to minimize arbitrary cost allocations and to improve full cost information.

257. The Board considered whether the costing methodology section should be recommended as a concept or a standard. It concluded that it should be a standard. The Board believes that cost accumulation and assignment principles contained in this section are definitive and should be followed by federal entities. Only by adhering to the principles and by continuous refinement of costing methodologies, can reliable full cost information be achieved.

Unused Capacity Costs

258. The ED proposed a standard, which, if adopted, would have required that entities measure the cost of unused operating capacity and report it as a separate expense. For this purpose, some entities, such as DoD, must separate operating capacity from "readiness capacities" which are reserved for war and emergency mobilization rather than normal operations. The operating capacity can be measured in terms of "practical capacity" which is the maximum units of output that the available capacity can produce taking the normal

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

stoppage and interruptions into consideration. Unused capacity is the excess of practical capacity over actual outputs.

259. A number of respondents appreciated the importance of the proposed requirement. They stated that capacity cost information would be very useful in improving the cost and capacity management of federal agencies. Several respondents from the private sector urged that the proposal be adopted immediately.

260. Most respondents from federal agencies, however, stated that capacity measurements involve very complex issues and are not feasible to implement at this time. If the proposed requirement were adopted, agencies would encounter two major types of difficulties. First, they lack guidance on defining and measuring various types of capacity. For example, respondents from DoD stated that it is difficult to develop criteria that can be used to differentiate defense operating capacity costs from mobilization capacity costs. Civilian agencies engaging in administrative, policy making, and regulatory activities also indicated difficulties in defining their practical capacities. Second, respondents of many agencies stated that they do not have the accounting capability to provide reliable capacity measures. Without such capability, unused capacity costs could be improperly estimated and the resulting information could be misleading.

261. Many respondents were also opposed to the proposed standard on the basis of cost-benefit considerations. They estimated that accounting for capacity costs would require substantial time and efforts to implement. This would require the use of their limited accounting personnel and equipment. Respondents from some agencies do not perceive that they have an over-capacity problem. Thus, it is very uncertain whether capacity accounting results, if produced, could be used to improve their operations.

262. After considering the responses to the ED,

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

the Board is convinced that it is premature to recommend capacity accounting either as a standard or as a concept. The Board is aware that federal agencies have limited personnel and other resources for accounting. They must devote those limited resources to improving general financial reporting and to establishing the more fundamental elements of managerial cost accounting. Thus, it would not be cost beneficial to implement capacity costing at this time.

263. Managing capacity costs is a part of cost management. Although this document does not recommend a standard for measuring capacity costs, the full cost information required by the full cost standard will help management in identifying capacity utilization problems. Some respondents stated that the capacity accounting concepts would be useful to capital intensive, industrial-type activities and activities that deliver repetitive services that are measurable in units. The Board is aware that there are on-going research efforts on the subject in the private accounting communities. Thus, the Board may reconsider capacity accounting in the future.

Effective Date

264. The Board holds the view that managerial cost accounting has been needed across the federal government for a long time. Since the standards are quite general and address only the highest levels of cost accounting, the Board felt that they should be implemented quickly. The earlier managerial cost accounting is started, the earlier the benefits will be seen in managing and controlling federal programs and activities. The Board also believes that an effective date far into the future would not serve to quickly change the government's tendency to neglect cost accounting. Therefore, in the exposure draft, the effective date was set for fiscal periods beginning after September 30, 1995 (i.e., beginning in fiscal year 1996).

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

265. A majority of respondents to the exposure draft commented that this date was too early and said that they foresee problems with implementation at September 30, 1995. Many reasons were given for a delay in implementation. Chief among these were (1) difficulty in obtaining funding to make necessary changes in financial systems before September 30, 1995, (2) a lack of trained accounting personnel and equipment, and (3) a need for time to develop or modify appropriate cost accounting methodologies and systems and develop management awareness and support. Respondents suggested implementation dates ranging from one to five years after the fiscal year 1996 date given in the exposure draft.

266. The Board recognized the validity of the concerns of many respondents over funding, training, and development of costing activities. However, it also recognized that federal agencies must be able to develop cost information very soon to meet the requirements of the GPRA. It also noted that reporting entities do not have to possess sophisticated cost accounting systems to meet the requirements in these standards. Federal agencies can take a gradual approach to the development of cost systems, if necessary, while developing basic cost information through other means in the short term.

267. Nevertheless, the Board agreed that the implementation date in the exposure draft may be a problem for many federal agencies since cost accounting is relatively new to most of them and the recommended implementation date is very near. The Board decided, therefore, to delay the implementation date by one additional year and make the standards effective for periods beginning after September 30, 1996, with earlier implementation encouraged.

268. Early on in the development of the managerial
cost accounting project, the task force determined that many problems can result in cost accounting from the use of similar terms to mean different

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

things. It concluded that the use of consistent cost accounting terminology is necessary to avoid confusion and mis-communication. Therefore, it recommended that the Board attach a glossary to the exposure draft which would define many of the cost accounting terms used.

269. The Board agreed with this recommendation. It also decided that the establishment of uniform cost accounting terminology within the federal government is so important that the glossary should contain not only definitions for terms used in the statement, but also definitions for other important cost accounting terms even if those terms are not used directly in the text of the statement. This glossary would serve as the beginning of a uniform and consistent cost accounting terminology for use within the federal government.

270. Comments were received from only one respondent to the exposure draft concerning the glossary. That respondent did not suggest changing any of the definitions provided in the glossary, but only suggested some additions. The Board decided that the glossary is sufficient for the time being and should be retained in the final statement as an appendix. However, it also decided that it may issue additions to the glossary at a later date as more federal agencies gain experience in the development of cost information, and as the need for additional standard definitions becomes apparent.

****

APPENDIX B: GLOSSARY

Activity - The actual work task or step performed in producing and delivering products and services. An aggregation of actions performed within an organization that is useful for purposes of activity-based costing.

Activity Analysis - The identification and description

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

of activities in an organization. Activity analysis involves determining what activities are done within a department, how many people perform the activities, how much time they spend performing the activities, what resources are required to perform the activities, what operational data best reflect the performance of the activities, and what customer value the activity has for the organization. Activity analysis is accomplished with interviews, questionnaires, observation, and review of physical records of work. It is the foundation for agency process value analysis, which is key to overall review of program delivery.

Activity-Based Costing - A cost accounting method that measures the cost and performance of process related activities and cost objects. It assigns cost to cost objects, such as products or customers, based on their use of activities. It recognizes the causal relationship of cost drivers to activities.

Actual Cost - An amount determined on the basis of cost incurred including standard cost properly adjusted for applicable variance.

Avoidable Cost - A cost associated with an activity that would not be incurred if the activity were not performed.

Common Cost - The cost of resources employed jointly in the production of two or more outputs and the cost cannot be directly traced to any one of those outputs.

Common Data Source - All of the financial and programmatic information available for the budgetary, cost, and financial accounting processes. It includes all financial and much non-financial data, such as environmental data, that are necessary for budgeting and financial reporting as well as evaluation and decision information developed as a result of prior reporting and feedback.

Controllable Cost - A cost that can be influenced by the action of the responsible manager. The term always refers to a specified manager since all costs are controllable by someone.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

Cost - The monetary value of resources used or sacrificed or liabilities incurred to achieve an objective, such as to acquire or produce a good or to perform an activity or service.

Cost Accounting Practice - Any disclosed or established accounting method or technique which is used for measurement of cost, assignment of cost to accounting periods, and assignment of cost to cost objects.

Cost Allocation - A method of assigning costs to activities, outputs, or other cost objects. The allocation base used to assign a cost to objects is not necessarily the cause of the cost. For example, assigning the cost of power to machine activities by machine hours is an allocation because machine hours are an indirect measure of power consumption.

Cost Assignment - A process that identifies costs with activities, outputs, or other cost objects. In a broad sense, costs can be assigned to processes, activities, organizational divisions, products, and services. There are three methods of cost assignment: (a) directly tracing costs wherever economically feasible, (b) cause-and-effect, and (c) allocating costs on a reasonable and consistent basis.

Cost Driver - Any factor that causes a change in the cost of an activity or output. For example, the quality of parts received by an activity, or the degree of complexity of tax returns to be reviewed by the IRS.

Cost Finding - Cost finding techniques produce cost data by analytical or sampling methods. Cost finding techniques are appropriate for certain kinds of costs, such as indirect costs, items with costs below set thresholds within programs, or for some programs in their entirety. Cost finding techniques support the overall managerial cost accounting process and can represent non-recurring analysis of specific costs.

Cost Object (also referred to as Cost Objective) - An activity, output, or item whose cost is to be measured.

In a broad sense, a cost object can be an organizational division, a function, task, product,

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

service, or a customer.

Differential Cost - The cost difference expected if one course of action is adopted instead of others.

Direct Cost - The cost of resources directly consumed by an activity. Direct costs are assigned to activities by direct tracing of units of resources consumed by individual activities. A cost that is specifically identified with a single cost object.

Estimated Cost - The process of projecting a future result in terms of cost, based on information available at the time. Estimated costs, rather than actual costs, are sometimes the basis for credits to work-in-process accounts and debits to finished goods inventory.

Expense - Outflow or other using up of resources or incurring liabilities (or a combination of both), the benefits from which apply to an entity's operations for the current accounting period, but do not extend to future periods.

Fixed Cost - A cost that does not vary in the short term with the volume of activity. Fixed cost information is useful for cost savings by adjusting existing capacity, or by eliminating idle facilities. Also called Non-Variable Cost or Constant Cost.

Full-Absorption Costing - A method of costing that assigns (absorbs) all labor, material, and service/manufacturing facilities and support costs to products or other cost objects. The costs assigned include those that do and do not vary with the level of activity performed.

Full Cost - The sum of all costs required by a cost object including the costs of activities performed by other entities regardless of funding sources.

Incremental Cost - The increase or decrease in total costs that would result from a decision to increase or decrease output level, to add a service or task, or to change any portion of operations. This information helps in making decisions such as to contract work out,

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

undertake a project, or increase, decrease, modify, or eliminate an activity or product.

Indirect Cost - A cost that cannot be identified specifically with or traced to a given cost object in an economically feasible way.

Inter-Entity - A term meaning between or among different federal reporting entities. It commonly refers to activities or costs between two or more agencies, departments, or bureaus.

Job Order Costing - A method of cost accounting that accumulates costs for individual jobs or lots. A job may be a service or manufactured item, such as the repair of equipment or the treatment of a patient in a hospital.

Managerial Cost Accounting System - The organization and procedures, whether automated or not, and whether part of the general ledger or stand-alone, that accumulates and reports consistent and reliable cost information and performance data from various agency feeder systems. The accumulated and reported data enable management and other interested parties to measure and make decisions about the agency's/segment's ability to improve operations, safeguard assets, control its resources, and determine if mission objectives are being met.

Opportunity Cost - The value of the alternatives foregone by adopting a particular strategy or employing resources in a specific manner. Also called Alternative Cost or Economic Cost.

Outcome - The results of a program activity compared to its intended purposes. Program results may be evaluated in terms of service or product quantity and quality, customer satisfaction, and effectiveness.

Outputs - Any product or service generated from the consumption of resources. It can include information or paper work generated by the completion of the tasks of an activity.

Performance Measurement - A means of evaluating

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

efficiency, effectiveness, and results. A balanced performance measurement scorecard includes financial and nonfinancial measures focusing on quality, cycle time, and cost. Performance measurement should include program accomplishments in terms of outputs (quantity of products or services provided, e.g., how many items efficiently produced?) and outcomes (results of providing outputs, e.g., are outputs effectively meeting intended agency mission objectives?). See Statement of Federal Financial Accounting Concepts No. 1, Objectives of Federal Financial Reporting, page 65.

Process - The organized method of converting inputs (people, equipment, methods, materials, and environment), to outputs (products or services). The natural aggregation of work activities and tasks performed for program delivery.

Process Costing - A method of cost accounting that first collects costs by processes and then allocates the total costs of each process equally to each unit of output flowing through it during an accounting period.

Process Value Analysis - Tools and techniques for studying processes through customer value analysis. Its objective is to identify opportunities for lasting improvement in the performance of an organization. It provides an in-depth review of work activities and tasks, through activity analysis, which aggregate to form processes for agency program delivery. In addition to activity-based costing, quality and cycle time factors are studied for a complete analysis of performance measurement. Each activity within the process is analyzed, including whether or not the activity adds value for the customer.

Product - Any discrete, traceable, or measurable good or service provided to a customer. Often goods are referred to as tangible products, and services are referred to as intangible products. A good or service is the product of a process resulting from the consumption of resources.

Responsibility Center - An organizational unit headed by a manager or a group of managers who are responsible for its activities. Responsibility centers can be

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

measured as revenue centers (accountable for revenue/sales only), cost centers (accountable for costs/expenses only), profit centers (accountable for revenues and costs), or investment centers (accountable for investments, revenues, and costs).

Responsibility Segment - A significant organizational, operational, functional, or process component which has the following characteristics: (a) its manager reports to the entity's top management; (b) it is responsible for carrying out a mission, performing a line of activities or services, or producing one or a group of products; and (c) for financial reporting and cost management purposes, its resources and results of operations can be clearly distinguished, physically and operationally, from those of other segments of the entity.

Service - An intangible product or task rendered directly to a customer.

Standard Costing - A costing method that attaches costs to cost objects based on reasonable estimates or cost studies and by means of budgeted rates rather than according to actual costs incurred. The anticipated cost of producing a unit of output. A predetermined cost to be assigned to products produced. Standard cost implies a norm, or what costs should be. Standard costing may be based on either absorption or direct costing principles, and may apply either to all or some cost elements.

Support Costs - Costs of activities not directly associated with production. Typical examples are the costs of automation support, communications, postage, process engineering, and purchasing.

Traceability - The ability to assign a cost directly to a specific activity or cost object by identifying or observing specific resources consumed by the activity or cost object.

Uncontrollable Cost - The cost over which a responsible manager has no influence.

Unit Cost - The cost of a selected unit of a good or

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

service. Examples include dollar cost per ton, machine hour, labor hour, or department hour.

Value-Added Activity - An activity that is judged to contribute to customer value or satisfy an organizational need. The attribute "value-added" reflects a belief that the activity cannot be eliminated without reducing the quantity, responsiveness, or quality of output required by a customer or organization. Value-added activities should physically change the product or service in a manner that meets customer expectations.

Variable Cost - A cost that varies with changes in the level of an activity, when other factors are held constant. The cost of material handling to an activity, for example, varies according to the number of material deliveries and pickups to and from that activity.

Variance - The amount, rate, extent, or degree of change, or the divergence from a desired characteristic or state.

THE FEDERAL ACCOUNTING STANDARDS ADVISORY BOARD

The Federal Accounting Standards Advisory Board (FASAB or "the Board" was established in October 1990 by the Secretary of the Treasury, the Director of the Office of Management and Budget (OMB), and the Comptroller General. The nine-member Board was created to consider and recommend accounting principles for the federal government.

The Board communicates its recommendations by publishing recommended accounting standards after considering the financial and budgetary information needs of congressional oversight groups, executive agencies, and other users of federal financial information. The Board also considers comments from the public on its proposed recommendations, which are

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_4.pdf.

published for comment as "exposure drafts." The Board's sponsors then decide whether to adopt the recommendations. If they do, the standard is published by OMB and GAO and then becomes effective.

The following documents related to the establishment and mission of the Board are available from the FASAB:

--Memorandum of Understanding among the General Accounting Office, the Department of the Treasury, and the Office of Management and Budget, on Federal Government Accounting Standards and a Federal Accounting Standards Advisory Board

--Mission Statement: Federal Accounting Standards Advisory Board

****

The Board expresses its appreciation to Managerial Cost Accounting Task Force members listed below for their contribution to developing the Exposure Draft of the Statement.

**********From Inside Front Cover**********

APPLICABILITY, MATERIALITY, AND TERMINOLOGY

These standards apply to general purpose financial reports of U.S. Government reporting entities. These standards need not be applied to immaterial items. Statement of Federal Financial Accounting Concepts No. 2 (SFFAC No. 2), "Entity and Display", lists criteria for defining Government reporting entities. Paragraph 78 of "Entity and Display" notes that some of a reporting entity's components may be required by law or policy to issue financial statements in accordance with accounting standards other than those recommended by the FASAB and issued by the OMB and the GAO, e.g., accounting standards issued by the Financial Accounting Standards Board or by a regulatory agency. Those components should continue to apply the standards used in these reports. The reporting entities of which the components are a part, however, need to be sensitive to differences that may arise from different accounting standards. If these differences are material, the standards recommended by the FASAB and issued by the OMB and the GAO should be applied. In such cases, the components would need to provide any additional disclosures or different measurements required by the accounting standards issued by the OMB and the GAO that would not be required by the other standards.

The word "disclosure" in FASAB's recommended standards indicates reporting information in notes or narrative that is regarded as an integral part of the basic financial statements, while "supplemental" indicates reporting information in schedules or narrative regarded as "required

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

supplementary information" as that term is used in accounting and auditing standards. Government auditing standards require little auditing assurance for required supplementary information. "Other accompanying information" refers to unaudited information that accompanies the audited financial statements. "Required supplementary stewardship information" is a new category of information FASAB proposes in its exposure draft, "Supplementary Stewardship Reporting", with the expectation that OMB and GAO will in collaboration agree upon audit procedures that would be appropriate to apply to this information. These terms are intended to indicate the Board's expectations regarding the minimum auditor's responsibility for the information, not its specific location within general purpose financial reports.

****
EXECUTIVE SUMMARY
****

a This Statement establishes accounting standards for liabilities of the federal government not covered in Statement of Federal Financial Accounting Standards Number 1, "Accounting for Selected Assets and Liabilities", and in Statement of Federal Financial Accounting Standards Number 2, "Accounting for Direct Loans and Loan Guarantees." This Statement defines "liability" as a probable future outflow or other sacrifice of resources as a result of past transactions or events. [FN 1:Liabilities recognized according to the standards in this Statement include both liabilities covered by budgetary resources and liabilities not covered by budgetary resources. Liabilities covered by budgetary resources are liabilities incurred that will be covered by available budgetary resources encompassing not only new budget authority but also other resources available to cover liabilities for specified purposes in a given year. Liabilities not covered by budgetary resources include liabilities incurred for which revenues or other sources of funds necessary to

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

pay the liabilities have not been made available through congressional appropriations or current earnings of the reporting entity. Notwithstanding an expectation that the appropriations will be made, whether they in fact will be made is completely at the discretion of the Congress. (Adapted from OMB Bulletin No. 94-01, "Form and Content of Agency Financial Statements.")]

b The Statements of Federal Financial Accounting Standards (SFFAS) and Concepts (SFFAC) referred to in this document are statements recommended by the Federal Accounting Standards Advisory Board (FASAB), approved by the Secretary of the Treasury, the Director of the Office of Management and Budget, and the Comptroller General (the Principals) and issued by the Office of Management and Budget (OMB) and the General Accounting Office (GAO).

c This Statement defines the recognition points for liabilities associated with different types of events and transactions (***Figure 1 IS AVAILABLE IN HARD COPY ONLY***).[FN 2: Recognition means reporting a dollar amount on the face of the basic financial statements.]

-- A liability arising from reciprocal or "exchange" transactions (i.e., transactions in which each party to the transaction sacrifices value and receives value in return) should be recognized when one party receives goods or services in return for a promise to provide money or other resources in the future (e.g., a federal employee performs services in exchange for compensation).

-- A liability arising from nonreciprocal transfers or "nonexchange" transactions (i.e., transactions in which one party to the transaction receives value without directly giving or promising value in return, such as grant and certain entitlement programs) should be recognized for any unpaid amounts due as of the reporting date. The liability includes amounts due from the federal entity to pay for benefits,

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

goods, or services [FN 3: Goods or services may be provided under the terms of the program in the form of, for example, contractors providing a service for the government on the behalf of the disaster relief beneficiaries.] provided under the terms of the program, as of the federal entity's reporting date, whether or not such amounts have been reported to the federal entity (e.g., estimated Medicaid payments due to health providers for service that has been rendered and that will be financed by the federal entity but have not yet been reported to the federal entity).

-- Government-related events are nontransaction-based events that involve interaction between federal entities and their environment. The event may be beyond the control of the entity. A liability is recognized for a future outflow of resources that results from a government-related event when the event occurs if the future outflow of resources is probable and measurable (see paragraphs 33 and 34 for the definitions of probable and measurable, respectively) or as soon thereafter as it becomes probable and measurable. Events, such as a federal entity accidentally causing damage to private property, would create a liability when the event occurred, to the extent that existing law and policy made it probable that the federal government would pay for the damage and to the extent that the amount of the payment could be estimated reliably. Government-related events also include hazardous waste spills on federal property caused by federal operations or accidents and catastrophes that affect government-owned property.

--Government-acknowledged events are events that are of financial consequence to the federal government because it chooses to respond to the event. A liability is recognized for a future outflow of resources that results from a government-acknowledged event when and to the extent that the federal government formally acknowledges financial responsibility for the event and a nonexchange or exchange transaction has occurred. The liability for a nonexchange

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

transaction should be recognized for any unpaid amounts due as of the reporting date and the liability for the an exchange transaction should be recognized when goods or services have been provided. The liability includes amounts due from the federal entity to pay for benefits, goods, or services provided under the terms of the program, as of the federal entity's reporting date, whether or not such amounts have been reported to the federal entity (Examples of government-acknowledged events include toxic waste damage caused by nonfederal entities and damage from natural disasters).

d In addition to discussing the general liability recognition principle, the Statement includes several specific federal liability accounting standards which are summarized below.

-- Contingencies - A contingency is an existing condition, situation, or set of circumstances involving uncertainty as to possible gain or loss to an entity that will ultimately be resolved when one or more future events occur or fail to occur. Contingent future outflows or other sacrifices of resources as a result of past transactions or events may be recognized, may be disclosed [FN 4: "Disclosure" in this document refers to reporting information in notes regarded as an integral part of the basic financial statements.], or may not be reported at all, depending on the circumstances.[FN 5: In the case of government-acknowledged events giving rise to nonexchange or exchange transactions, there must be a formal acceptance of financial responsibility by the federal government, as when the Congress has appropriated or authorized (i.e., through authorization legislation) resources. Furthermore, exchange transactions that arise from government-acknowledged events would be recognized as a liability when goods or services are provided. For nonexchange transactions, a liability would then be recognized at the point the unpaid amount is due. Therefore, government-acknowledged events do not meet the criteria necessary to be recognized as a contingent

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

liability.] Contingencies should be recognized as a liability when a past transaction or event has occurred, a future outflow or other sacrifice of resources is probable, and the related future outflow or sacrifice of resources is measurable. A contingent liability should be disclosed if any of the conditions for liability recognition are not met and there is a reasonable possibility that a loss or an additional loss may have been incurred. Disclosure should include the nature of the contingency and an estimate of the possible liability, an estimate of the range of the possible liability, or a statement that such an estimate cannot be made.

-- Capital leases - In a lease transaction, the lessee should report a liability when one or more of four specified capital lease criteria are met (see detailed criteria on paragraph 43). The amount to be recorded by the lessee as a liability[FN 6: "The cost of general property, plant, and equipment acquired under a capital lease shall be equal to the amount recognized as a liability for the capital lease at its inception." (See SFFAS No. 6, "Property, Plant, and Equipment".)] under a capital lease is the present value of the rental and other minimum lease payments during the lease term, excluding that portion of the payments representing executory cost to be paid by the lessor.

-- Federal debt - Federal debt transactions are recognized as a liability when there is an exchange between the involved parties. Fixed-value securities are securities that have a known maturity or redemption value at the time of issue. These securities should be valued at their original face (par) values net of any unamortized discount or premium. Amortization of the discount or the premium should normally follow the interest method; in certain cases, the straight line method is permitted (see paragraph 50). Variable-value securities should be originally valued and periodically revalued at their current value on the basis of the regulations or offering language. The related interest cost of the federal debt

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

includes the accrued (prorated) share of the nominal interest incurred during the accounting period, the amortization amounts of discount or premium for each accounting period, and the amount of change in the current value for the accounting period for variable-value securities.

-- Pensions, other retirement benefits, and other postemployment benefits - The liability and associated expense for pensions and other retirement benefits (including health care) should be recognized at the time the employee's services are rendered. The expense for postemployment benefits should be recognized when a future outflow or other sacrifice of resources is probable and measurable based on events occurring on or before the reporting date. Any part of that cost unpaid at the end of the period is a liability. The aggregate entry age normal actuarial cost method should be used to calculate the expense and the liability for the pension and other retirement benefits for the administrative entity financial statements, as well as the expense for the employer entity financial statements. The employer entity should recognize an expense and a liability for postemployment benefits when a future outflow or other sacrifice of resources is probable and measurable on the basis of events that have occurred as of the reporting date.

-- Insurance and guarantee programs - All federal insurance and guarantee programs [FN 7: Social insurance is considered to be a separate program type not included within insurance and guarantee programs. See social insurance discussion in FASAB ED, "Supplementary Stewardship Reporting."] (except social insurance and loan guarantee programs [FN 8: Accounting for federal loan guarantee programs should follow the Statement of Federal Financial Accounting Standards Number 2, "Accounting for Direct Loans and Loan Guarantees" (August 23, 1993).]) should recognize a liability for unpaid claims incurred resulting from insured events that have already occurred. Insurance and guarantee programs

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

should recognize as an expense all claims incurred during the period, including, when appropriate, those not yet reported. The change in a contingent liability during the reporting period should also be recognized as a component of expense. Life insurance programs should recognize a liability for future policy benefits in addition to the liability for unpaid claims incurred. All federal insurance and guarantee programs (except life insurance and loan guarantee programs) should also report as required supplementary stewardship information (RSSI) the expected losses that are based on risk inherent in the insurance and guarantee coverage in force.

INTRODUCTION

****

PURPOSE

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

1 The purpose of this Statement is to establish accounting standards to recognize and measure liabilities in general purpose federal financial reports, which are issued for both internal and external users. Appendixes provide background, rationale, and examples of how to apply this standard to liabilities associated with federal programs' transactions and events.

SCOPE

2 This Statement articulates a general principle that should guide preparers of general purpose federal financial reports. It also provides more detailed guidance regarding liabilities resulting from deferred compensation, insurance and guarantees (except social insurance), certain entitlements, and certain other transactions. The Statement addresses liabilities not covered in Statement of Federal Financial Accounting Standards (SFFAS) Number 1, "Accounting for Selected Assets and Liabilities", and in Statement of Federal Financial Accounting Standards Number 2, "Accounting for Direct Loans and Loan Guarantees."

3 The concept of a liability in this document is consistent with those in Statements Number 1 and 2. The definition amends the stated definition of a liability in SFFAS Number 1. This Statement establishes accounting for liabilities not covered in SFFAS No. 1 and 2. Statement Number 1 addresses only those selected liabilities that routinely recur in normal operations and are due within a fiscal year. The liabilities covered in Statement Number 1 are accounts payable, interest payable, and other current liabilities, such as accrued salaries, accrued entitlement benefits payable, and unearned revenue. [FN 9: Adapted from Statement of Federal Financial Accounting Standards (SFFAS) Number 1, "Accounting for Selected Assets and Liabilities" (March 30, 1993), p. 25.]

4 Statement Number 2 addresses liabilities specifically arising from direct loans and loan

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

guarantees. Loan guarantees are "any guarantee, insurance, or other pledge with respect to the payment of all or part of the principal or interest on any debt obligation of a nonfederal borrower to a nonfederal lender, but they do not include the insurance of deposits, shares, or other withdrawable accounts in financial institutions."[FN 10: OMB Circular No. A-11 as cited in Statement of Federal Financial Accounting Standards Number 2, "Accounting for Direct Loans and Loan Guarantees" (August 23, 1993), p. 46.]

5 The general conceptual definition of "liability" underlying this Statement is similar in some respects to that articulated by the Financial Accounting Standards Board (FASB) but the FASAB made certain modifications to the private sector concept to apply it within the federal context. Also, as is explained in the Basis for Conclusions, the specific standards dealing with pensions, other retirement benefits, and postemployment benefits differ from those the FASB has published.

6 This Statement requires certain disclosures about existing liabilities. The Statement, however, does not fully address information about stewardship responsibilities, including social insurance,[FN 11: Stewardship responsibilities are further discussed in "Supplementary Stewardship Reporting."] related to future financial reporting periods. Such information may be reported in a supplementary stewardship report, pursuant to standards now being developed (see FASAB's ED, "Supplementary Stewardship Reporting"). Information about projected future outflows is vital to making informed decisions about public policies, including the level of benefits promised under current law and the level of revenues/premiums required to liquidate the liability (if any).

7 The recognition of social insurance programs[FN 12: Social insurance programs are income transfer programs financed by compulsory earmarked taxes and in certain cases also include

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

general revenues of the federal government.] presented the Board with significant theoretical and practical problems. The exposure process for the draft liability standard brought forth strongly held positions about social insurance. Upon reconsideration of the issues the Board concluded that, regardless of the technical merits of the arguments concerning the nature of social insurance programs, it was questionable whether adequate information concerning social insurance could be presented by means of a single, point-in-time number on a Balance Sheet. The Board modified the draft standard so it would require several measures of social insurance to be presented. The Board decided that, given the sensitivity and magnitude of social insurance, the new proposal should receive additional exposure to allow users to review it and comment. The Board felt that the concepts and alternatives had not yet been presented to the user community in sufficient detail. Hence, the discussion of social insurance has been withdrawn from the liability standard and presented in the "Supplementary Stewardship Reporting" Exposure Draft. (For more details see the Basis for Conclusions).

OBJECTIVES OF FEDERAL FINANCIAL REPORTING

8 When developing accounting standards for the federal government, the significant environmental differences between the federal government and the private sector must be kept in mind. Statement of Federal Financial Accounting Concepts Number 1, "Objectives of Federal Financial Reporting", discusses the federal accounting and financial reporting environment. It notes the following:

-- The federal government is unique, when compared with any other entity in the country, because it is the vehicle through which the citizens of the United States exercise their sovereign power. The federal government has the power through law, regulation, and taxation to exercise ultimate control over many facets of the national economy and society. All other entities

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

within the nation, both public and private, operate within the context of laws, oversight, and accountability established by the national government. The federal government is accountable only to its citizens. It is politically accountable to the electorate, but no higher agency has the power to demand an accounting from the government.

9 The objectives of federal financial reporting were designed to guide the Board in developing accounting standards to enhance the financial information reported by the federal government. The four objectives are discussed under the headings (1) budgetary integrity, (2) operating performance, (3) stewardship, and (4) systems and control. These objectives were used as a basis to develop the Liability Statement. The Board believes that the operating performance objective has special relevance to decisions about recognition and measurement of liabilities in general purpose federal financial reports. That objective reads as follows:

"Federal financial reporting should assist report users in evaluating the service efforts, cost, and accomplishments of the reporting entity; the manner in which these efforts and accomplishments have been financed; and the management of the entity's assets and liabilities."[FN 13: Statement of Federal Financial Accounting Concepts Number 1, 'Objectives of Federal Financial Reporting" (Sept. 2, 1993).]

10 At the same time, the Board recognizes that the third objective, dealing with stewardship, is equally important.

"Federal financial reporting should assist report users in assessing the impact on the country of the government's operations and investments for the period and how, as a result, the government's and the nation's financial conditions have changed and may change in the future.

Federal financial reporting should provide

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

information that helps the reader to determine:

-- whether the government's financial position improved or deteriorated over the period;

-- whether future budgetary resources will likely be sufficient to sustain public services and to meet obligations as they come due; and

-- whether government operations have contributed to the nation's current and future well-being.

Examples of information relevant to this objective include:

-- the amount of assets, liabilities, and net assets (or net position);

-- an analysis of government debt, its growth, and debt service requirements;

-- changes in the amount and service potential of capital assets; and
the amount of contingent liabilities and unrecognized obligations [FN 14: The term "obligation" is used in its everyday or generic sense, not as it is used in federal budgetary accounting.] (such as the probable cost of deposit insurance)."

Accordingly, information about projected future responsibilities and resources is as important as information about assets, liabilities, revenues, and expenses.

ENTITY AND DISPLAY

11 SFFAC Number 2, "Entity and Display" is a concept statement that provides a framework for defining the meaningful reporting units for general purpose federal financial reports with consideration of the relationships among the budgetary, organizational, and programmatic units. The Concept Statement also describes in general terms the nature of general purpose federal

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

financial reports, including their names and formats. Agreement on the concepts of entity and display is necessary to establish standards for presenting general purpose federal financial reports.

12 The "Entity and Display" and Liability Statements are interrelated in several ways. Decisions on each affected the other. For example, the "Entity and Display" Concept Statement suggests what reporting units should report liabilities and, in general terms, how these liabilities should be displayed. The provisions of the Concept Statement that contemplate presentation of information about future stewardship responsibilities as well as information about events and transactions that have occurred are related to the selection of events and transactions to be recognized.[FN 15: See Statement of Federal Financial Accounting Concepts (SFFAC) Number 2, "Entity and Display" (April 20, 1995).]

EFFECTIVE DATE

13 The accounting standards presented in this Statement become effective for fiscal periods beginning after September 30, 1996. Earlier implementation is encouraged.

STRUCTURE OF THIS DOCUMENT

14 This document has three sections, two appendixes, and a glossary. The first section, the executive summary, precedes this section. This introduction constitutes the second section. The remaining section and appendixes are described below.

Liability Standards

15 This section presents a definition and criteria for recognizing a liability and related disclosure requirements. It also provides specific standards for contingencies, capital leases, federal debt, pensions, other

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

postemployment and retirement benefits, and insurance (other than social insurance) and guarantees.

Appendix A: Basis For Conclusions

16 This appendix summarizes considerations that members of the Board deemed significant in reaching the conclusions in the Statement.

Appendix B: Liability Recognition and Measurement Matrix

17 The Liability Recognition and Measurement Matrix illustrates the measurement attributes and recognition points for several transactions and events (***THIS MATRIX IS AVAILABLE IN HARD COPY ONLY***).

Glossary

18 The glossary defines various terms used in this Statement.

****

LIABILITY STANDARDS

****

DEFINITION AND GENERAL PRINCIPLE FOR RECOGNITION OF A LIABILITY

19 A liability for federal accounting purposes is a probable future outflow or other sacrifice of resources as a result of past transactions or events. General purpose federal financial reports should recognize [FN 16: Recognition means reporting a dollar amount on the face of the basic financial statements.] probable and measurable future outflows or other sacrifices of resources arising from (1) past exchange transactions, (2) government-related events, (3) government-acknowledged events, or (4) nonexchange transactions that, according to current law and applicable policy, are unpaid amounts due as of the reporting date.[FN 17: This document uses the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

term "nonexchange transaction" in a way similar to FASB's "nonreciprocal transfer." That is, it implies a one-way flow of resources, services, or promises between two parties. "Transaction" in the phrase "nonexchange transaction" does not include reclassification, closing, and similar "internal" entries to the accounting records, though some accountants use the term in that broader sense. "Probable" means more likely than not. "Measurable" means reasonably estimable.]

Events and Transactions

20 The existence of a past event (which includes transactions) is essential for liability recognition. An event is a happening of financial consequence to an entity.[FN 18: "Consequence" is defined as something of importance or significance.] An event may be an internal event that occurs within an entity, such as transforming raw materials into a product. An event may also be an external event that involves interaction between an entity and its environment, such as a transaction with another entity, an act of nature, a theft, vandalism, an injury caused by negligence, or an accident.

21 As the term is used in this Statement, a transaction involves the transfer of something of value. Transactions may be either exchange transactions or nonexchange transactions. The distinction between exchange and nonexchange transactions is important in determining the point of liability recognition in federal accounting.

22 An exchange transaction arises when each party to the transaction sacrifices value and receives value in return. There is a two-way flow of resources or of promises to provide resources. In an exchange transaction, a liability is recognized when one party receives goods or services in return for a promise to provide money or other resources in the future.[FN 19: Executory contracts where goods and services have not been received are not generally recognized as liabilities in financial accounting, although they

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

are generally recognized as obligations in governmental budgetary accounting.]

23 An example of an exchange transaction occurs when a federal employee performs services in exchange for compensation. The compensation includes current salary and future retirement benefits. An exchange transaction occurs because both parties (the employee and the employer) receive and sacrifice value. The expense is recognized in the period that the exchange occurs. The compensation liability includes unpaid salary amounts earned and the cost of future retirement benefits related to current period services.

24 A nonexchange transaction arises when one party to a transaction receives value without directly giving or promising value in return. There is a one-way flow of resources or promises. For federal nonexchange transactions, a liability should be recognized for any unpaid amounts due as of the reporting date. This includes amounts due from the federal entity to pay for benefits, goods, or services [FN 20: Goods or services may be provided under the terms of the program in the form of, for example, contractors providing a service for the government on the behalf of the disaster relief beneficiaries.] provided under the terms of the program, as of the federal entity's reporting date, whether or not such amounts have been reported to the federal entity (for example, estimated Medicaid payments due to health providers for service that has been rendered and that will be financed by the federal entity but have not yet been reported to the federal entity).

25 Many grant and certain entitlement programs are nonexchange transactions. When the federal government creates an entitlement program or gives a grant to state or local governments, the provision of the payments is determined by federal law rather than through an exchange transaction.

26 An event is defined as a happening of financial consequence to an entity. For federal

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

financial reporting, some events may be other than transaction based and these events may be classified in one of two categories: (1) government-related events or (2) government-acknowledged events.

27 Government-related events are nontransaction-based events that involve interaction between the federal government and its environment. The event may be beyond the control of the federal entity. In general, a liability is recognized in connection with government-related events on the same basis as those that arise in exchange transactions. Events, such as a federal entity accidentally causing damage to private property, would create a liability when the event occurred, to the extent that existing law and policy made it probable that the federal government would pay for the damages and to the extent that the amount of the payment could be estimated reliably. [FN 21: The vast majority of claims against the United States Government stemming from tortious government conduct are adjudicated under the Federal Tort Claims Act (FTCA), which provides for both administrative and judicial resolution. Administrative awards under the established threshold are paid from agency appropriations. Administrative awards in excess of the established threshold are paid from the judgment appropriation. Court judgments and compromise settlements by the Department of Justice are paid from the judgment appropriation regardless of amount. This Act means that, for certain types of events it is not necessary for the government to acknowledge financial responsibility separately for each individual event as is the case for events described in paragraph 30.]

28 Government-related events include:

(1) cleanup from federal operations resulting in hazardous waste that the federal government is required by statutes and/or regulations, that are in effect as of the Balance Sheet date, to clean up (i.e., remove, contain, or dispose of);[FN 22: See SFFAS No. 6, "Accounting

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

for Property, Plant, and Equipment" for a detailed discussion of cleanup cost.]

(2) accidental damage to nonfederal property caused by federal operations; and

(3) other damage to federal property caused by such factors as federal operations or natural forces.[FN 23: The subjects of valuing assets and of measuring asset impairments--thus measuring the loss to be recognized--are beyond the scope of this Statement. See SFFAS No. 6, Accounting for Property, Plant, and Equipment for a discussion on the impairment or loss of federal property.]

29 Government-related events resulting in a liability should be recognized in the period the event occurs if the future outflow or other sacrifice of resources is probable and the liability can be measured, or as soon thereafter as it becomes probable and measurable.

30 Government-acknowledged events are those nontransaction-based events that are of financial consequence to the federal government because it chooses to respond to the event. The federal government has broad responsibility to provide for the public's general welfare. The federal government has established programs to fulfill many of the general needs of the public and often assumes responsibilities for which it has no prior legal obligation.

31 Consequently, costs from many events, such as toxic waste damage caused by nonfederal entities and natural disasters, may ultimately become the responsibility of the federal government. But these costs do not meet the definition of a "liability" until, and to the extent that, the government formally acknowledges financial responsibility for the cost from the event and an exchange or nonexchange transaction has occurred. In other words, the federal entity should recognize the liability and expense when both of the following two criteria have been met (1) the Congress has appropriated or authorized (i.e.,

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

through authorization legislation) resources and (2) an exchange occurs (e.g., when a contractor performs repairs) or nonexchange amounts are unpaid as of the reporting date (e.g., direct payments to disaster victims), whichever applies.

32 The following example illustrates the liability recognition of government-acknowledged events. A tornado damages a U.S. town and the Congress appropriates funds in response to the disaster. This event is of financial consequence to the federal government because the federal government chooses to provide disaster relief to the town. Transactions resulting from this appropriation, including disaster loans, outright grants to individuals, and work performed by contractors paid by the federal entities, are recognized as exchange or nonexchange transactions. In the case of exchange transactions, amounts payable for goods and services provided to federal entities are recognized when the goods are delivered or the work is done. In the case of nonexchange transactions, a liability should be recognized for any unpaid amounts due as of the reporting date. The liability includes amounts due from the federal entity to pay for benefits, goods, or services provided under the terms of the program, as of the federal entity's reporting date, whether or not such amounts have been reported to the federal entity.

Probable Future Outflow or Other Sacrifice of Resources

33 "Probable" refers to that which can reasonably be expected or is believed to be more likely than not on the basis of available evidence or logic. The probability of a future outflow or other sacrifice of resources is assessed on the basis of current facts and circumstances. These current facts and circumstances include the law that provides general authority for federal entity operations and specific budget authority to fund programs. If budget authority has not yet been

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

provided, a future outflow or other sacrifice of resources might still meet the probability test if (1) it directly relates to ongoing entity operations and (2) it is the type for which budget authority is routinely provided. Therefore, the definition applies both to liabilities covered by budgetary resources and to liabilities not covered by budgetary resources.[FN 24: See Statement of Federal Financial Accounting Standards Number 1, "Accounting for Selected Assets and Liabilities", (March 30, 1993), app. A, p. 25.]

Measurability

34 "Measurability" means that an item has a relevant attribute that can be quantified in monetary units with sufficient reliability to be reasonably estimable. Liabilities reported in the financial report are measured by different attributes specified by various accounting standards. Several different measurement attributes are used for different items in present practice (e.g., fair market value, current cost, present value, expected value, settlement value, and historical cost).

CONTINGENCIES

35 A contingency is an existing condition, situation, or set of circumstances involving uncertainty as to possible gain or loss to an entity. The uncertainty will ultimately be resolved when one or more future events occur or fail to occur. Resolution of the uncertainty may confirm a gain (i.e., acquisition of an asset or reduction of a liability) or a loss (i.e., loss or impairment of an asset or the incurrence of a liability).[FN 25: Contingencies are different from "subsequent events" as used in the accounting/audit literature. Subsequent events are events or transactions that occur subsequent to the Balance Sheet date, but prior to the issuance of the financial statements and auditor's report, that have a material effect on the financial statements and therefore require adjustment or disclosure in the statements.]

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

36 This Statement does not deal with gain contingencies or measurement of contingencies that involve impairment of nonfinancial assets. When a loss contingency (i.e., contingent liability) exists, the likelihood that the future event or events will confirm the loss or the incurrence of a liability can range from probable to remote. The probability classifications are as follows:

-- Probable: The future confirming event or events are more likely than not to occur.

-- Reasonably possible: The chance of the future confirming event or events occurring is more than remote but less than probable.

-- Remote: The chance of the future event or events occurring is slight.

37 The following are some examples of loss contingencies:

-- collectibility of receivables,
-- pending or threatened litigation, and
-- possible claims and assessments.

Criteria for Recognition
of a Contingent Liability

38 A contingent liability should be recognized when all of these three conditions are met: [FN 26: The unit of analysis for estimating liabilities can vary according to the reporting entity and the nature of the transaction or event. The liability recognized may be the estimation of an individual transaction or event; or a group of transactions and events. For example, SFFAS Number 2, "applies to direct loans and loan guarantees on a group basis, such as a cohort or a risk category of loans and loan guarantees. Present value accounting does not apply to direct loans or loan guarantees on an individual basis, except for a direct loan or loan guarantee that constitutes a cohort or a risk category."

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

Statement of Federal Financial Accounting Standards Number 2, "Accounting for Direct Loans and Loan Guarantees" p.9. See the standard on Insurance and Guarantees in this document for a description of incurred but not reported (IBNR) claims.]

-- A past event or exchange transaction has occurred (e.g., a federal entity has breached a contract with a nonfederal entity).[FN 27: In the case of government-acknowledged events giving rise to nonexchange or exchange transactions, there must be a formal acceptance of financial responsibility by the federal government, as when the Congress has appropriated or authorized (i.e., through authorization legislation) resources. Furthermore, exchange transactions that arise from government-acknowledged events would be recognized as a liability when goods or services are provided. For nonexchange transactions, a liability would then be recognized at the point the unpaid amount is due. Therefore, government-acknowledged events do not meet the criteria necessary to be recognized as a contingent liability.]

-- A future outflow or other sacrifice of resources is probable (e.g., the nonfederal entity has filed a legal claim against a federal entity for breach of contract and the federal entity's management believes the claim is more likely than not to be settled in favor of the claimant).

-- The future outflow or sacrifice of resources is measurable (e.g., the federal entity's management determines an estimated settlement amount).

39 The estimated liability may be a specific amount or a range of amounts. If some amount within the range is a better estimate than any other amount within the range, that amount is recognized. If no amount within the range is a better estimate than any other amount, the minimum amount in the range is recognized and the range and a description of the nature of the contingency

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

should be disclosed.

Criteria for Disclosure of a Contingent Liability

40 A contingent liability should be disclosed if any of the conditions for liability recognition are not met and there is at least a reasonable possibility that a loss or an additional loss may have been incurred. "Disclosure" in this context refers to reporting information in notes regarded as an integral part of the basic financial statements.

41 Disclosure should include the nature of the contingency and an estimate of the possible liability, an estimate of the range of the possible liability, or a statement that such an estimate cannot be made.

42 In some cases, contingencies may be identified but the degree of uncertainty is so great that no reporting (i.e., recognition or disclosure) is necessary in the general purpose federal financial reports. Specifically, contingencies classified as remote need not be reported in general purpose federal financial reports, though law may require such disclosures in special purpose reports. If information about remote contingencies or related to remote contingencies is included in general purpose federal financial reports (e.g., the total face amount of insurance and guarantees in force), it should be labeled in such a way to avoid the misleading inference that there is more than a remote chance of a loss of that amount.

CAPITAL LEASES

43 Capital leases are leases that transfer substantially all the benefits and risks of ownership to the lessee. If, at its inception, a lease meets one or more of the following four criteria, the lease should be classified as a capital lease by the lessee:

-- The lease transfers ownership of the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

property to the lessee by the end of the lease term.

-- The lease contains an option to purchase the leased property at a bargain price.

-- The lease term is equal to or greater than 75 percent of the estimated economic life of the leased property.

-- The present value of rental and other minimum lease payments, excluding that portion of the payments representing executory cost, equals or exceeds 90 percent of the fair value of the leased property.

The last two criteria are not applicable when the beginning of the lease term falls within the last 25 percent of the total estimated economic life of the leased property. If a lease does not meet at least one of the above criteria it should be classified as an operating lease.

44 The amount to be recorded by the lessee as a liability under a capital lease is the present value of the rental and other minimum lease payments during the lease term, excluding that portion of the payments representing executory cost to be paid by the lessor.[FN 28: "The cost of general property, plant, and equipment acquired under a capital lease shall be equal to the amount recognized as a liability for the capital lease at its inception." See SFFAS No. 6, Accounting for Property, Plant, and Equipment.] However, if the amount so determined exceeds the fair value of the leased property at the inception of the lease, the amount recorded as the liability should be the fair value. If the portion of the minimum lease payments representing executory cost is not determinable from the lease provisions, the amount should be estimated.

45 The discount rate to be used in determining the present value of the minimum lease payments ordinarily would be the lessee's incremental borrowing rate unless (1) it is practicable for the lessee to learn the implicit rate computed by

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

the lessor and (2) the implicit rate computed by the lessor is less than the lessee's incremental borrowing rate. If both these conditions are met, the lessee shall use the implicit rate. The lessee's incremental borrowing rate shall be the Treasury borrowing rate for securities of similar maturity to the term of the lease.

46 During the lease term, each minimum lease payment should be allocated between a reduction of the obligation and interest expense so as to produce a constant periodic rate of interest on the remaining balance of the liability.[FN 29: OMB Circular No. A-11, "Preparation and Submission of Annual Budget Estimates," explains the measurement of budget authority, outlays, and debt for the budget in the case of lease-purchases and other capital leases. Circular A-94, "Guidelines and Discount Rates for Benefit-Cost Analysis of Federal Programs," provides the requirements under which a lease-purchase or other capital lease has to be justified and the analytical methods that need to be followed.]

FEDERAL DEBT AND RELATED INTEREST COST

47 This standard applies to all securities or other debt instruments issued by the U.S. Treasury or other federal agencies. It encompasses debt issued to the public and debt issued to federal accounts by other federal accounts.[FN 30: This includes but is not limited to debt issued by the U.S. Treasury to trust funds, agency borrowings from Treasury, and trust fund borrowings from other trust funds.]

48 Accounting for the federal debt should identify the amount of the outstanding debt liability of the federal government at any given time and the related interest cost for each accounting period. This entails valuing securities initially at their sales price or proceeds, ultimately at the amount paid to the holder at maturity, and in the intervening period

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

in a way that fairly expresses the federal government's liability.

Accounting for Federal Debt Securities[FN 31: Figure 2 (available in Hard Copy only) lists various categories and examples of federal debt securities.]

49 Federal debt securities fall into two major categories for accounting purposes: fixed value securities and variable value securities.

Fixed Value Securities

50 Fixed value securities have a known maturity or redemption value at the time of issue. These securities should be valued at their original face (par) value net of any unamortized discount or premium. Securities sold at face (par) have no discount or premium and should be valued at face (par). Securities sold at a discount will increase in value between sale and maturity; securities sold at a premium will decrease in value. Amortization of the discount or premium may follow the straight line method or the interest method.[FN 32: For an explanation and an example of the interest method of amortization, see Appendix B of SFFAS No. 1.] Either method is acceptable in the cases of

-- short-term securities that have a maturity of 1 year or less, and

-- longer-term securities for which the amount of amortization under the straight-line method would not be materially different from the amount of amortization under the interest method.

51 In all other cases, the interest method for amortizing any discount or premium should be used.

Variable Value Securities

52 Variable value securities have unknown redemption or maturity values at the time of issue. Values of these securities can vary on the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

basis of regulation or specific language in the offering. These securities should be originally valued and periodically revalued at their current value, on the basis of the regulations or offering language.

Related Interest Cost

53 The related interest cost of the federal debt include:

-- the accrued (prorated) share of the nominal interest incurred during the accounting period,

-- the amortization amounts of discount or premium for each accounting period (based on the same amortization method used to account for the related debt liability) for fixed value securities, and

-- the amount of change in the current value for the accounting period for variable value securities.

Retirement Prior to Maturity

54 For those securities that are retired prior to the maturity date due to a call feature of the security, or because they are eligible for redemption by the holder on demand, the difference between the reacquisition price and the net carrying value of the extinguished debt should be recognized currently in the period of the extinguishment as losses or gains.

Old Currencies Issued by the Federal Government[FN 33: Old currencies include National and Federal Reserve Bank Notes, Old Demand Notes, Old Series currency, and silver certificates classified as public debt pursuant to 31 U.S.C. 5119.]

55 Pursuant to federal law, old currencies issued by the federal government and not yet redeemed or written off are identified as a federal debt liability at face value and do not

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

bear any interest.

**********FIGURE 2: VARIOUS CATEGORIES AND EXAMPLES OF FEDERAL DEBT SECURITIES APPEARED HERE IN THE HARD COPY TEXT **********
[FN 34: These tables are intended to illustrate current practice only and are not to be considered authoritative.]

PENSIONS, OTHER RETIREMENT BENEFITS, AND OTHER POSTEMPLOYMENT BENEFITS

56 Employee benefits of federal civilian and military personnel and veterans[FN 35: Veterans' compensation included in this category is a measurable program benefit that directly relates to a veteran's prior military service and is not the type of benefit included in general fund benefit programs. For example, compensatory income payments for injuries sustained in the line of duty (i.e., VA disability compensation benefits) are employee benefits, while entitlement benefits (i.e., VA pension) are accounted for as general fund benefits. (Also see Appendix A: Basis for Conclusions.)] include pensions and postemployment and retirement benefits other than pensions. Pension plans[FN 36: This standard addresses "defined benefit plans," which define the future benefits that will be paid in terms of such factors as age, years of service, or compensation. The amount of benefit depends on a number of future events incorporated in the plan's benefit formula.] provide benefits upon retirement and may also provide benefits for death, disability, or other termination of employment before retirement. Pension plans may also include benefits to survivors and dependents, and they may contain early retirement or other special features. The actuarially determined liability and expense of the plan, including all its provisions, is part of the pension plan's liability and expense estimate.

57 In addition to or in lieu of pension

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

benefits, a liability for postemployment and other retirement benefits may be incurred outside the pension plan. Postemployment benefits other than pensions (OPEB) include all types of benefits provided to former or inactive (but not retired) employees, their beneficiaries, and covered dependents.[FN 37: Special termination benefits (such as specially authorized separation incentive programs) are considered other postemployment benefits and should be recognized as such.] Inactive employees are those who are not currently rendering services to their employers and who have not been terminated, but who are not eligible for an immediate annuity, including those temporarily laid off or disabled. OPEB include salary continuation, severance benefits, counseling and training, continuation of health care or other benefits, and unemployment and workers' compensation benefits paid by the employer entity.[FN 38: The terms "employer entity" and "administrative entity" are used in this document to distinguish between entities that employ federal workers and thereby generate the employee costs, including pension cost, and those that are responsible for managing and/or accounting for the pension or the other employee plan. For example, entities that receive "salaries and expense" appropriations are employer entities, while the Office of Personnel Management is an administrative entity because it administers the civilian retirement benefit plans.]

58 Retirement benefits other than pensions (ORB) are all forms of benefits to retirees or their beneficiaries provided outside the pension plan. Examples include health and life insurance. Retirement health care benefits are the primary ORB expense. They present unique measurement problems.

59 Pension benefits, OPEB, and ORB are exchange transactions because the employee performs service in part to receive the deferred compensation provided by the plans (such as future pension and medical care benefits). For pension and other retirement benefits, the expense is recognized at

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

the time the employees' services are rendered. For OPEB, the expense is recognized at the time the accountable event occurs. Any part of that cost unpaid at the end of the period is a liability.

60 This Statement is intended to specify the accounting objectives. With regard to pensions and ORB, if estimates, averages, or such devices can reduce the cost of applying this Statement, their use is appropriate provided the results do not materially differ from a detailed application of the standard.

Pensions

61 Pension benefits include all retirement, disability, and survivor benefits financed through a pension plan, including unfunded pension plans. Federal civilian and military employees are covered primarily under the following three defined benefit retirement plans: Civil Service Retirement System (CSRS), Federal Employees Retirement System (FERS), and Military Retirement System (MRS). To the extent that federal employees are covered by social insurance programs (such as Social Security), the taxes they pay to the program and the benefits they will eventually receive are to be accounted for on the same basis used to account for other program participants. However, the payments to social insurance plans that agencies must make are operating costs. Similarly, to the extent that federal employees are covered by defined contribution plans (i.e., the Thrift Savings Plan, which is like a 401(k) plan), federal payments to the plan are expenses, but the plan itself is not covered under this standard.

62 This Statement establishes standards of accounting for pension expense and related pension liability for federal government employers and administrative agencies.

Accounting for the Pension Plan

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

63 This section covers federal pension plans. The entity that administers the plan (i.e., the "administrative entity") should account for and report the plan in accordance with this standard.[FN 39: In addition to the requirements of this standard, which deals with general purpose financial reports, federal plans report annually pursuant to P.L. 95-595, which calls for statements of net assets available for benefits, a statement of accumulated benefits, and other statements.] A subsequent section covers federal employer entities.

64 Attribution Methods--The "aggregate entry age normal" actuarial cost method should be used to calculate the pension expense, the liability for the administrative entity financial statements, and the expense for the employer entity financial statements. The aggregate entry age normal method is one under which the actuarial present value of projected benefits is allocated on a level basis over the earnings or the service of the group between entry age and assumed exit ages; and it should be applied to pensions on the basis of a level percentage of earnings. The portion of this actuarial present value allocated to a valuation year is called the "normal cost." The portion not provided for at a valuation date by the actuarial present value of future normal cost is called the "actuarial accrued liability."[FN 40: Adapted from Actuarial Standards of Practice No.4, "Measuring Pension Obligations" (Jan. 1990), p. 31.] The plan, however, may use other actuarial cost methods if it explains why aggregate entry age normal is not used and if the results are not materially different.

65 Assumptions--For financial reports prepared for the three primary federal plans (CSRS, FERS, and MRS), the best available actuarial estimates of assumptions should be used to calculate the pension expense and liability. The selection of all actuarial assumptions should be guided by Actuarial Standards of Practice No. 4, "Measuring Pension Obligations," as revised from time to time by the Actuarial Standards Board.[FN 41: The

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

Actuarial Standards Board is a board within the American Academy of Actuaries that sets professional standards of actuarial practice.] Accordingly, actuarial assumptions should be on the basis of the actual experience of the covered group, to the extent that credible experience data are available, but should emphasize expected long-term future trends rather than give undue weight to recent past experience. Although emphasis should be given to the combined effect of all assumptions, the reasonableness of each actuarial assumption should be considered independently on the basis of its own merits and its consistency with each other assumption.

66 In addition to complying with the guidance in the preceding paragraph, the interest rate assumption should be based on an estimated long-term investment yield for the plan, giving consideration to the nature and the mix of current and expected plan investments and the basis used to determine the actuarial value of assets; or if the plan is not being funded, other long-term assumptions (for example, the long-term federal government borrowing rate). The underlying inflation rate and the other economic assumptions should be consistent. The rate used to discount the pension obligation should be equal to the long-term expected return on plan assets.

67 The administrative entity should disclose the assumptions used. Administrative entities are encouraged to consult with one another to achieve the maximum consistency among assumptions used for financial reports. Smaller federal administrative entities may employ the assumptions used by any of the three primary plans where appropriate or their own assumptions. If they use assumptions that differ from all of the primary plans, a footnote should explain how and why the assumptions differ from one of those plans.

68 Assets should be reported separately from the pension liability rather than reporting only a net liability. Assets of federal pension plans should be carried at their acquisition cost, adjusted for

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

amortization, if appropriate. For investments in market-based and marketable securities, the market value of the investment should be disclosed.[FN 42: See SFFAS Number 1, "Accounting for Selected Assets and Liabilities."]

69 Past Service Cost, Prior Service Cost, and Actuarial Gains and Losses--Past service costs result from retroactive benefits granted when a new plan is initiated. Prior service costs result from retroactive benefits granted in a plan amendment. A plan amendment may also reduce benefits attributed to prior service. This results in a gain to the extent that previously recognized benefits are reduced. As explained in the next paragraph, the accounting for such gains should be consistent with accounting for retroactive benefit increases. Actuarial gains and losses are changes in the balance of the pension liability that result from (1) deviations between actual experience and the actuarial assumptions used or (2) changes in actuarial assumptions.

70 The administrative entity should recognize all past and prior service costs (or gains) immediately, without amortization. Similarly, the administrative entity should recognize all actuarial gains and losses immediately, without amortization.

71 Accounting by the Administrative Entity-- The administrative entity should account for and report the pension liability in its financial report, using the aggregate entry age normal actuarial method. The liability is the actuarial

present value of all future benefits, based on projected salaries and total projected service, less the actuarial present value of future normal cost contributions that would be made for and by the employees under the plan. Projected salaries should reflect an estimate of the future compensation levels of the individual employees involved, including future changes attributed to the general price level, productivity, seniority,

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

promotion, and other factors.

72 The administrative entity should report a pension expense for the net of the following components:

-- normal cost;

-- interest on the pension liability during the period;

-- prior (and past) service cost from plan amendments (or the initiation of a new plan) during the period, if any; and

-- actuarial gains or losses during the period, if any.

The individual components should be disclosed.

73 The administrative entity should report revenue for the sum of amounts received from the employer entity representing contributions from:

-- the employer entity and

-- its employees.[FN 43: The administrative entity may also receive financing from the General Fund to cover prior service or other cost for which contributions from employer entities are not provided.]

The employer entity's contribution represents intragovernmental revenue.[FN 44: Intragovernmental revenue should be eliminated for government-wide consolidated financial statements.]

An illustration of the accounting for the administrative entity (and the employer entity) is explained in the following section entitled "Accounting Illustration."

Employer Entity Accounting

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

74 The federal employer entity should recognize a pension expense in its financial report that equals the service cost[FN 45: "Service cost" is defined as the actuarial present value of benefits attributed by the pension plan's benefit formula to services rendered by employees during an accounting period. The term is synonymous with "normal cost."] for its employees for the accounting period, less the amount contributed by the employees, if any. The measurement of the service cost should require the use of the plan's actuarial cost method and assumptions, and therefore the factor to be applied by the employer entities must be provided by the plan and/or the administrative entity.

75 The employer entity's pension expense should be balanced by: (a) a decrease to its "fund balance with Treasury" for the amount of its contribution to the pension plan, if any; and if this does not equal the full expense, by (b) an increase to an account representing an intragovernmental imputed financing source entitled, for example, "imputed financing - expenses paid by other agencies." The latter represents the amount being financed directly through the pension plan's administrative entity.

76 In special instances when an employer entity is also the administrative entity, that is, when there is no separate pension plan (e.g., the Coast Guard), the employer entity should report the liability and recognize the pension expense for all components of cost. The liability and the expense should be accounted for as described in the preceding section for the administrative entity without reference to transactions with external employer entities.

Accounting Illustration

77 Tables 1-4 provide an example in which the employer entity recognizes an "employer's pension expense" in an amount equal to the service cost attributable to its employees during the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

accounting period, less the employees' own contributions. The expense in this example is more than the contribution that the employer entity is required by law to pay. The difference between the employer's pension expense and the employer's contribution is credited to the employer entity as a financing source ("imputed financing-expenses paid by other entities"). The employer entity transfers its contribution and that of its employees to the administrative entity.

78 The administrative entity recognizes revenue for: (1) contributions from the employer entity, (2) contributions from the employees, and (3) interest on the plan's investments. The administrative entity recognizes expense for the net of the pension cost components.

Assumptions are as follows:

-- Total normal cost of employees for the accounting period is $160,000.

-- The employer's pension expense is $100,000. The employer entity would calculate its pension expense on the basis of information received from the plan and/or the administrative entity. Its pension expense is equal to its share of the service cost of its employees' pensions.

-- According to current law, the employer entity is authorized in its appropriation to pay $60,000 for employee pensions.

-- The employees contribute $60,000 to the pension fund.

-- No general fund appropriations made directly to the administrative agency are involved in these transactions, as they could be under actual operations.

Entry #1 -- Employer entity's entry to record pension expense:

DR. Employer's Pension Expense	$100,000
CR. Appropriations Used	$60,000
CR. Imputed Financing - Expenses Paid by Other Entities	40,000

****

Table 1
Employer Entity's Other Financing Sources as They Should Appear on Its Statement of Changes in Net Position

FINANCING SOURCES:[FN 46: SFFAC No. 2, "Entity and Display" presents a change in the way revenue and other financing sources are reported. This illustration reflects the new concepts.]

Appropriations Used.....$60,000
Imputed financing $40,000

Note: Imputed financing covers the difference between (1) the employer entity's contribution transferred to the administrative entity pursuant to law (exclusive of the employees' contributions) and (2) the employer's pension expense calculated on the basis of information received from the administrative entity--as shown immediately below.

Employer Entity's Cost as It Should Appear on the Statement of Net Cost

COST :

Employer's pension cost....$ 100,000

Note: This is the employer entity's service cost of employee pensions. The employer entity would calculate this amount using factors provided by the plan and/or the administrative entity. Also to be transferred to the administrative entity is the amount withheld from employees' wages, as called for under the terms of the plan. The employees' contribution is not an expense of the employer entity.
****

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

**Note: The above table and those that follow in the sections on pensions and ORB are presented for illustrative purposes only; the responsibility for defining the form and content of a financial statement prepared pursuant to the Chief Financial Officers Act, as amended, is the responsibility of the Office of Management and Budget.

Entry #2 -- Administrative entity's entry to record revenue received from employer entity:

DR. Fund Balance with Treasury $120,000
CR. Retirement Program Revenue - Contribution Received from Employer Entity $60,000
CR. Retirement Program Revenue - Contribution Received from Employees $60,000

Entry #3 -- Administrative entity's entry to record revenue from interest on investments in Treasury securities:

DR. Fund Balance with Treasury $XXX,XXX
CR. Interest Revenue $XXX,XXX

****

Table 2

Administrative Entity's Revenue as It Should Appear on the Statement of Net Cost

LESS OTHER EARNED REVENUES:

Contributions received from employer entities	$ 60,000
Contributions received from employees	60,000
Interest on investments	XX,XXX
Total other earned revenues	$ XXX,XXX

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

Note: Contributions are amounts transferred to the administrative entity from the employer entity representing its contribution--and that of its employees--for the employees' pensions.
****

Entry # 4 -- Administrative entity's entry to record its pension expense:

DR. Pension Expense $XXX,XXX
CR. Pension Liability $XXX,XXX

****
Table 3

Administrative Entity's Pension Expense

Normal cost $160,000
Interest on pension liability XXX
Prior serv. costs (gains) (if any) XXX
Actuarial gains(losses) (if any) XXX

Total pension expense .....$ XXX,XXX

**Note: The $160,000 represents 100 percent of the normal cost--as calculated by plan actuaries--for the one employer entity in this example. According to law, $60,000 of this amount is to be contributed by the employer entity and $60,000 is to be contributed by the employees themselves. The remaining $40,000 is a liability of the pension plan (covered by future financing sources). The pension expense is reported on the Statement of Net Cost in accordance with paragraph 72.
****

incurred (as calculated in table 3)	XXX,XXX
Less: payments made to beneficiaries	XXX,XXX
Ending liability balance	$ XX,XXX,XXX

Note: The liability balance should be reported on the administrative entity's Balance Sheet.
****

Other Retirement Benefits (ORB)

79 ORB include all retirement benefits other than pension plan benefits.[FN 47: See Appendix A: Basis for Conclusions, for a discussion of reporting medical costs for veterans.] ORB are provided outside the pension plan by an employer to a former employee or the employee's beneficiary upon retirement. The predominant ORB in the federal government is retirement health care benefits, and they are the focus of this section.[FN 48: Accounting for life insurance is described in a separate section of the liability standard. However, to the extent that premiums paid by covered individuals and employer entities do not fully cover the retirement life insurance cost of employees, the employer entities would account for the additional cost as described in this section.]

80 Future health care benefits present unique measurement problems. They are more uncertain than pensions since they depend on the changing patterns of health care delivery and utilization, on the price trends for medical care, and on the benefits provided by social insurance programs like Medicare (part A). Also, medical plans do not vest like pensions in which, after a fixed number of years of service, an employee has a right to receive payment. To receive ORB benefits the employee must retire with health care benefits provided by the organization.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

81 This Statement establishes standards of accounting for ORB expense and related ORB liability for federal government employers and administrative agencies.

Accounting for the ORB Plan

82 Attribution Method--The aggregate entry age normal actuarial cost method should be used to calculate the ORB expense and liability for the administrative entity's financial statements, and the expense for the employer entity's financial statements. As indicated in the pension section, aggregate entry age normal is a method under which the actuarial present value of projected benefits is allocated on a level basis over the earnings or the service of the group between entry age and assumed exit ages. It should be applied to ORB on the basis of service rendered by each employee. The portion of this actuarial present value allocated to a valuation year is called the normal cost. The portion not provided for at a valuation date by the actuarial present value of future normal cost contributions is called the actuarial accrued liability.[FN 49: Adapted from Actuarial Standards of Practice No. 4, p. 31. Also see Actuarial Standard of Practice No. 6 "Measuring and Allocating Actuarial Present Values of Retiree Health Care and Death Benefits," Actuarial Standards Board (1988).] Unlike federal pensions, retiree health care benefits do not depend on future salary levels of individual employees but rather are allocable to each employee on a per person basis. Plans may use other actuarial cost methods if they explain why aggregate entry age normal is not used and if the results are not materially different.

83 Assumptions--Amounts calculated for financial reports prepared for ORB plans should reflect (1) general actuarial and economic assumptions that are consistent with those used for pensions and (2) a health care cost trend assumption that is consistent with Medicare projections or other authoritative sources appropriate for the population covered by the plan. The rate used to

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

discount projected benefits should be equal to the long-term expected return on plan assets if the plan is being funded or on other long-term assumptions (for example, the long-term federal government borrowing rate) for unfunded plans. The administrative entity should disclose the assumptions used.

84 The accrual period should be based on expected retirement age rather than the age when the employee first becomes eligible.

85 Assets should be reported separately from the ORB liability rather than merely reporting the net liability. Assets of federal ORB plans should be carried at their acquisition cost, adjusted for amortization, if appropriate.[FN 50: See SFFAS No. 1, "Accounting for Selected Assets and Liabilities."] For investments in market-based and marketable securities, the market value of the investment should be disclosed.

86 Past Service Cost, Prior Service Cost, and Actuarial Gains and Losses--The standard for ORB is the same as that for pensions. Past service costs result from retroactive benefits granted when a new plan is initiated. Prior service costs result from retroactive benefits granted in a plan amendment. A plan amendment may also reduce benefits attributed to prior service resulting in a gain to the plan to the extent that previously recognized benefits are reduced. The accounting for such gains should be consistent with accounting for retroactive benefit increases. Actuarial gains and losses are changes in the balance of the ORB liability that result from (1) deviations between actual experience and the actuarial assumptions used or (2) changes in actuarial assumptions.

87 The administrative entity should recognize all past and prior service costs (or gains) immediately, without amortization. Similarly, the administrative entity should recognize all actuarial gains and losses immediately, without amortization.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

88 Accounting for the ORB Plan--The ORB plan should be accounted for in a way that is very similar to that described above for pensions. The administrative entity should account for and report the ORB liability in its financial report, using the aggregate entry age normal method. The liability is the actuarial present value of all future benefits less the actuarial present value of future normal cost contributions that would be made for and by the employees under the plan. The administrative entity should report an ORB expense for the net of the following components:

-- normal cost,

-- interest on the ORB liability during the period,

-- prior (and past) service costs from plan amendments (or the initiation of a new plan) during the period, if any,

-- any gains/losses due to a change in the medical inflation rate assumption; and

-- other actuarial gains or losses during the period, if any.

The individual components should be disclosed.

89 The administrative entity should report revenue for the sum of amounts received, if any, from the employer entity representing contributions from:

-- the employer entity and

-- its employees.

The employer entity's contribution represents intragovernmental revenue.[FN 51: Intragovernmental revenue should be eliminated for government-wide consolidated financial statements.] An illustration of the accounting

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

for the administrative entity (and employer entity) is provided in the following section entitled "Accounting Illustration".

Employer Entity Accounting

90 The federal employer entity should account for and report the ORB expense in its financial report in a manner similar to that used for pensions. The employer's ORB expense should be recognized in an amount equal to the total service cost[FN 52: "Service cost" is defined as the actuarial present value of benefits attributed to services rendered by employees during an accounting period. The term is synonymous with "normal cost".] for its employees for the accounting period, less the amount contributed by its employees, if any. The measurement of the service cost requires use of the plan's actuarial cost method and assumptions. The cost factor should be provided to the agencies on a per employee basis by the administrative entity and/or the plan.

91 The employer entity's ORB expense should be balanced by (a) a decrease to the employer entity's "fund balance with Treasury" for the amount of its contributions to the ORB plan, if any; and, if this does not equal the full expense, (b) by an increase to an account representing an intragovernmental financing source entitled, for example, "imputed financing - expenses paid by other entities." The latter represents the amount being financed directly through the ORB plan.

92 In special instances when an employer entity is also the administrative entity, the employer entity should report the liability and recognize the ORB expense for all components of cost. For example, the entity is paying its retirees' ORB on a pay-as-you-go basis. The liability and the expense should be accounted for as described in the preceding section for the administrative entity accounting without reference to transactions with external employer entities.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

Accounting Illustration

93 Tables 5-8 provide an example where the employer entity recognizes an "employer's ORB expense" in an amount equal to the service cost attributable to its employees during the accounting period. In this example, neither the employer entity nor its employees contribute to the plan. The employer's ORB expense is offset by a credit to the employer entity as a financing source ("imputed financing-expenses paid by other entities"). The administrative entity recognizes a revenue and other financing source for contributions from the General Fund. The administrative entity recognizes an expense for the total ORB expense.

Assumptions are as follows:

-- Total normal cost of employees for the accounting period is $10,000.[FN 53: This is the amount attributable to the government for its share of future medical care costs for future retirees. Although this simplified illustration does not show contributions other than those from the General Fund, current retirees pay premiums for their health insurance that partially defray the cost of the program. Federal civilian retirees pay approximately 25-30 percent of the total health benefit premium.]

-- The employer's ORB expense is $10,000. The employer entity should calculate its expense on the basis of factors received from the plan and/or the administering entity. For example, the plan-supplied factor is $100 per employee (or full-time equivalent); if the employer has 100 employees, the expense would be $10,000. (The employer's ORB expense equals the service cost of its employees' retirement health care.)

-- The employer and employees do not make contributions to a fund. The cost of retirement health care is paid for by General Fund appropriations directly to the administrative entity on a pay-as-you-go basis.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

Other Postemployment Benefits (OPEB)

94 OPEB are provided to former or inactive employees, their beneficiaries, and covered dependents outside pension or ORB plans. Inactive employees are those who are not currently rendering services to the employer but who have not been terminated, including those temporarily laid off or disabled. Postemployment benefits can include salary continuation, severance benefits, counseling and training, continuation of health care or other benefits, and unemployment, workers' compensation, and veterans' disability compensation benefits paid by the employer entity.

95 The employer entity should recognize an expense and a liability for OPEB when a future outflow or other sacrifice of resources is probable and measurable on the basis of events occurring on or before the reporting date. For example, a reduction in force may require an employer entity to make severance payments, unemployment reimbursements, or other payments in future periods. Similarly, an injury on the job may require the employer entity to make short- or long-term reimbursements to the federal workers' compensation program. A long-term OPEB liability should be measured at the present value of future payments. This will require the employer entities to estimate the amount and timing of future payments, and to discount the future outflow using the Treasury borrowing rate for securities of similar maturity to the period over which the payments are to be made.

96 Most OPEB liabilities should be short-term because the benefits will be paid in the near future. Some OPEB, however, could be longer term.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

For example, a liability for workers' compensation or veterans' disability compensation might be long-term for some injuries since federal employer entities might be required to reimburse the program for many years.[FN 54: Both the federal employee unemployment program and the federal workers' compensation program are financed by direct reimbursements from federal employers.] Also, certain specially authorized separation incentive programs could provide for payments that extend over many future years.

INSURANCE AND GUARANTEES

Nature of Federal Insurance and Guarantee Programs[FN 55: In the federal government, the aspects of insurance and guarantees are frequently commingled within the same program. Therefore, this Statement treats the terms as a single type of activity.]

97 Insurance and guarantee programs are federal programs that provide protection to individuals or entities against specified risks. Many of these programs were established to assume risks that private sector entities are unable or unwilling to assume [at least at prices that beneficiaries of the program can afford (in some cases) or want to pay (in other cases)] or to subsidize the provision of insurance to achieve social objectives. Program participants pay fees or premiums for specific services. These funds are commonly held in revolving funds within the federal government; losses sustained by participants are paid from these funds. Many of these programs receive appropriations to pay excess claims and/or have authority to borrow from the Treasury.

98 For accounting purposes, private sector insurance and guarantee contracts are customarily divided into two types. The first type provides insurance protection for a fixed period. The insurer may cancel the coverage or adjust the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

provisions of coverage at the end of any coverage period, for example, by adjusting the amount of premiums charged or changing the conditions under which coverage is provided. Most property insurance and health insurance offered by private insurers is of this type.

99 The second type of insurance or guarantee contract is one in which the insurer cannot cancel the insurance or the insured is guaranteed the ability to renew it. The insurer must provide coverage for an extended period until the insured event occurs or can no longer occur, or when the insured party allows the policy to lapse. Examples of this type of insurance offered by private insurers include whole and guaranteed renewable term life insurance, annuities, and title insurance.

100 Federal programs provide protection against many types of risk for individuals and entities. These include life insurance; medical insurance; and insurance against damage to property (homes, crops, and airplanes) or other assets (deposits and pension benefits) caused by perils such as flooding and other natural disasters, war-risk, and insolvency.

101 For federal insurance and guarantee programs, there often is no explicit contract. For example, the federal government, acting through the Pension Benefit Guaranty Corporation (PBGC), functions as an insurer of pension benefits, but the "contract" with employers and pension plans is implicit in federal law, not explicit in contracts between PBGC and employers. Moreover, the PBGC itself has no power to set premiums or to change the terms of coverage, though it may recommend changes to the Congress. The Congress has occasionally raised premiums and changed other factors, such as pension plan funding requirements, in an effort to achieve the statutory intent that the program be self-financing without appropriations from general revenue.[FN 56: Further details on PBGC may be found in "Controlling Losses of the Pension Benefit Guaranty Corporation", Congressional

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

Budget Office, January 1993.] Companies with defined benefit pension plans must participate, but may (and sometimes do) elect to terminate their defined benefit pension plans.

102 Federal insurance programs also differ from private insurance in that they are not subject to the same market forces (e.g., competition for business and for capital) and regulatory requirements (e.g., for capitalization) that apply to privately owned insurers. In particular, federal insurance, unlike private insurance, is not extended with the intent of earning a profit. Some programs operate deliberately at a loss, as when disabled veterans are offered life insurance at premiums set for healthy participants. Other programs offer insurance covering catastrophic or systemic risks, where large losses can occur all at once, as in war-risk or deposit insurance. At most, federal insurance programs are expected just to meet anticipated costs, leaving them vulnerable to unfavorable surprises.

103 For this reason, the issue in accounting for federal insurance and guarantee programs is when to recognize net expected losses. In this respect, federal insurance programs are similar to federal credit programs. The federal government extends credit on terms and conditions designed to subsidize particular borrowers or encourage particular activities for social policy reasons. As soon as a federal direct loan or loan guarantee is obligated, the federal government is committed to bear whatever loss, through defaults or interest subsidies, is inherent in the terms and the conditions under which the credit is extended. The government is likewise committed when federal insurance is extended to additional policyholders, either for an additional fixed period, or to cover additional amounts of assets.

Accounting for Liabilities of Federal Insurance and Guarantee Programs

104 All federal insurance and guarantee programs

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

(except social insurance and loan guarantee programs[FN 57: Social insurance is considered to be a different type of program not included within insurance and guarantee programs. See social insurance discussion in the FASAB ED, "Supplementary Stewardship Reporting". Accounting for all federal loan guarantee programs should follow the Statement of Federal Financial Accounting Standards Number 2, "Accounting for Direct Loans and Loan Guarantees" (August 23, 1993).]) should recognize a liability for unpaid claims incurred, resulting from insured events that have occurred as of the reporting date. The standard requires recognition of the liability that is known with certainty plus an accrual for a contingent liability recognized when an existing condition, situation, or set of circumstances involving uncertainty as to possible loss exists and the uncertainty will ultimately be resolved when one or more probable future events occur or fail to occur; a future outflow or other sacrifice of resources is probable; and the future outflow or sacrifice of resources is measurable. Insurance and guarantee programs should recognize as an expense all claims incurred during the period, including, when appropriate, those not yet reported and contingencies that meet the criteria for recognition. Life insurance programs should recognize a liability for future policy benefits (a liability to current policyholders that relates to insured events, such as death or disability) in addition to the liability for unpaid claims incurred. (See Contingencies section for the criteria for disclosure of a contingent liability.)

105 Risk assumed information is important for all federal insurance and guarantee programs (except social insurance, life insurance and loan guarantee programs) and will be considered in the context of the Stewardship reporting. Risk assumed is generally measured by the present value of unpaid expected losses net of associated premiums, based on the risk inherent in the insurance or guarantee coverage in force.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

Additional Disclosures for Insurance and Guarantee Programs Administered by Government Corporations

106 When financial information pursuant to FASB's standards on federal insurance and guarantee programs conducted by government corporations is incorporated in general purpose financial reports of a larger federal reporting entity, the entity should report as RSSI what amounts and periodic change in those amounts would be reported under the "risk assumed" approach referred to in this section (see par. 105). In other words, in addition to the liability for unpaid claims from insured events that have already occurred (including any contingent liability that meets criteria for recognition), such reporting entities should also report as RSSI risk assumed information.

Illustrations of the Application of the Standard

107 Table 9 [**Availiable in Hard Copy Only**] illustrates the application of the liability recognition, disclosure, and supplementary reporting standards for six federal insurance and guarantee programs. Two of these, flood and crop insurance, offer fixed period annual insurance. A third, deposit insurance, also can be said to offer fixed period annual insurance, though in practice it is continually renewed at the option of the insurer.[FN 58: In effect, FDIC's options are to renew the insurance coverage or to assume losses of the institution; only Congress can reduce or eliminate the deposit insurance program.] A fourth program listed, overseas private investment insurance, offers a fixed period multi-year written contract. The fifth program, life insurance, offers coverage that in practice is noncancelable by the insurer and guaranteed renewable by the insured, continuing until the insured event has occurred or the policy is cancelled by the insured. Finally, the pension benefit guarantee program is included as an example of noncancelable insurance. Pension

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

insurance is characterized here as noncancelable with respect to vested guaranteed benefits earned by covered employees to date, on the assumption that this coverage would remain in effect even if the Congress ended the program.

108 The column numbered (3) in the table shows the point at which the standard requires a liability to be recognized for insurance and guarantee programs except life insurance. Column (3) recognizes all unpaid claims and expected claims resulting from insured events that have already occurred, whether floods, crop damage, overseas investment losses, bank closures and insolvencies, deaths, or pension plan terminations. The liability for unpaid claims is the estimated amount needed to settle claims relating to insured events that have occurred on or before the reporting date. This liability includes a contingent liability recognized when an existing condition, situation, or set of circumstances involving uncertainty as to possible loss exists and the uncertainty will ultimately be resolved when one or more probable future events occur or fail to occur; a future outflow or other sacrifice of resources is probable; and the future outflow or sacrifice of resources is measurable.

109 The liability at the end of any period should be the expected unpaid net loss inherent in insured events that have occurred, including any claims --both claims reported and when appropriate, claims incurred but not reported (IBNR)-- and any contingent liabilities that meet the criteria for recognition. When payments and losses extend beyond the current year, net losses should be calculated on a present value basis to reflect the time value of money. The expense for claims incurred in the reporting period should be recognized in that period. Changes in estimates of claim cost resulting from the present value calculations, the continuous review process, and differences between estimates and actual payments for claims should be recognized as charges against operations of the period in which the estimates are changed or payments are made.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

110 Liability recognition for life insurance programs spans over columns (3) and (4). The column numbered (4) in the table shows the point at which the standard requires liability recognition for life insurance and supplementary reporting for other insurance and guarantee programs. The supplementary reported amounts represent the present value of unpaid expected losses based on the risk assumed as a result of insurance coverage net of associated premiums.

********** TABLE 9 : "LIABILITY RECOGNITION, SUPPLEMENTARY INFORMATION AND DISCLOSURE FOR FEDERAL INSURANCE AND GUARANTEE PROGRAMS" APPEARED HERE IN THE HARD COPY TEXT **********

111 Insurance programs are on-going and may be viewed as having long term characteristics. Thus, from a broader, longer term perspective, the liability to be recognized (column 3), and the amount to be reported as supplementary information (column 4) may be conceptually different and materially different from each other. From the broader perspective column (4) could be a longer term measure and a probabilistic estimate of future costs of these programs.

112 For noncancelable or guaranteed renewable insurance also, a difference arises between columns (3) and (4). Thus, for pension guarantees, column (3) shows the net present value of losses arising from plans that have already been terminated or that are more likely than not to be terminated. This is the amount to be recognized as a liability. Column (4) shows the net present value of the expected loss inherent in the risk assumed as a result of coverage on the guaranteed and vested benefit amounts. This number should be reported as supplementary information. It will generally be larger than the liability because it includes a provision for the additional losses that are expected to arise because some plan sponsors currently in good

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

financial condition will in the future face bankruptcy with pension assets too small to cover the vested benefits that were guaranteed.

113 The liability for life insurance includes both the liability for unpaid claims, including IBNR (i.e., column 3), and a liability for net future policy benefit outflows (i.e., column 4). The liability for future policy benefits represents the expected present value of future outflows to be paid to, or on behalf of, existing policyholders, less the expected present value of future net premiums to be collected from those policyholders. The liability is estimated using appropriate financial or actuarial methods that include assumptions, such as estimates of expected investment yield, mortality, morbidity, terminations, and expenses, applicable at the time the insurance contracts are made and in accordance with existing law and related policy (see specific whole life insurance standard below). Changes in the liability for future net policy benefit outflows that result from periodic re-estimations would be recognized as expense in the period in which the changes occur. The effects of changes in relevant law or policy would be recognized when those changes occur.

114 The assessments of losses expected based on the risk assumed may be made by appropriate actuarial or financial methods that include information and assumptions applicable to the economic, legal, and policy environment in force at the time the assessments are made. Since all future events are uncertain, indicators of the range of uncertainty around expected estimates, including indicators of the sensitivity of the estimates to changes in major assumptions, should also be reported.

Whole Life Policies

115 Some VA life insurance programs are whole life policies.[FN 59: Whole life policies provide insurance over the insured's entire life and the proceeds (face amount) are paid only upon

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

death of the insured. A level premium is usually paid for policies of this type. The premium may be paid annually or more frequently.] These programs operate in a manner similar to private sector mutual life insurance enterprises,[FN 60: A mutual company is an incorporated entity without private ownership interests which operates for the benefit of its policyholders and their beneficiaries. With limited exceptions, mutual companies issue only participating policies. In a mutual company, participating policyholders have the right to vote for members of the company's board of directors or trustees. In some states, the insurance laws provide that upon liquidation of a mutual insurance company, the net assets are distributed among the existing policyholders of the company, and the prior policyholders have no claim against such assets.] except that the regulations and market forces that control the private sector are different for these federal programs. VA life insurance policyholders are issued participating policies, and a portion of the earnings from those policies is returned to policyholders in the form of dividends. The following paragraphs specifically address the accounting required for federal whole life insurance programs.

116 The premiums collected by the insurer are used to pay benefits and other cost, and the balance is usually invested to yield additional income. These assets would be fund balances with Treasury or investments. Encompassed in the liability (also referred to as policy reserves) is cash surrender value and the liability for future policy benefits. The cash surrender value is the portion of premiums paid or other amount recoverable on an insurance policy if immediately canceled. The liability for future policy benefits is the present value of future outflows to be paid to (or in behalf of) policyholders, less the present value of future related premiums. In general, for whole life policies, the liability for future policy benefits should be no less than the cash surrender value that accrues to the benefit of policyholders.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

Accounting for Liabilities of Federal Whole Life Insurance Programs

117 All federal reporting entities with whole life insurance programs should follow the standards as prescribed in the private sector standards (and as these private sector standards are amended) when reporting the liability for future policy benefits, in addition to the required disclosures described below. [FN 61: The applicable private sector standards are as follows, FASB SFAS 60 "Accounting and Reporting by Insurance Enterprises," FASB SFAS 97 "Accounting and Reporting by Insurance Enterprises for Certain Long- Duration Contracts and for Realized Gains and Losses from the Sale of Investments," and FASB SFAS 120 "Accounting and Reporting by Mutual Life Insurance Enterprises and by Insurance Enterprises for Certain Long-Duration Participating Contracts" and AICPA Statement of Position (SOP) 95-1 "Accounting for Certain Insurance Activities of Mutual Life Insurance Enterprises."

For those federal entities with "mutual enterprise-type" whole life insurance programs, FASB SFAS 120 should be followed. SFAS 120 states that mutual life insurance enterprises shall apply SFAS 60 or 97, as appropriate, to participating life insurance contracts unless those contracts meet both of the following conditions:

-- The contracts are long-duration participating contracts that are expected to pay dividends to policyholders based on actual experience of the insurer.

-- Annual policyholder dividends are paid in a manner that identifies divisible surplus and distributes that surplus in approximately the same proportion as the contracts are considered to have contributed to divisible surplus (commonly referred to in actuarial literature as the contribution principle).

If the participating life insurance contracts meet

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

the above conditions SOP 95-1 should be followed.]

118 A liability for future policy benefits relating to participating life insurance contracts should be equal to the sum of:

a. the net level premium reserve for death and endowment policy benefits,

b. the liability for terminal dividends, and

c. any premium deficiency.[FN 62: The liability for future policy benefits is consistent with the liability required by SOP 95-1. Net level premium reserve is the excess, if any, of the present value of future guaranteed death endowment benefits over the present value of future net premiums. The net level premium reserve should be calculated based on the dividend fund interest rate, if determinable, and mortality rates guaranteed in calculating the cash surrender values described in the contracts. The dividend fund interest rate is the interest rate determined at policy issuance used to determine the amount of the dividend fund. It is the rate used to credit interest to the dividend fund, and against which experience is measured to determine the amount of the interest portion of dividends paid to individual policyholders. Terminal dividends are dividends to policyholders calculated and paid upon termination of a contract, such as on death, surrender, or maturity. If the payment of terminal dividends is probable and the amount can be reasonably estimated, the liability should be recognized. (AICPA SOP 95-1, Glossary, p. 33)]

119 An assessment should be made to compare the liability for future policy benefits using actuarial assumptions applicable at the time the contract is made (contract assumptions) with the liability for future policy benefits using assumptions that consider current economic conditions and experience (current conditions). Actual mortality, morbidity, and termination rates should be used when determining experience. For

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

economic conditions, the nature and the mix of current and expected investments should be considered with expected long-term yields.

120 A premium deficiency occurs if the liability for future policy benefits using current conditions exceeds the liability for future policy benefits using contract conditions; the difference should be recognized as a charge to operations in the current period.

Additional Whole Life Insurance Disclosure

121 All components of the liability for future policy benefits (i.e., the net level premium reserve for death and endowment policy and the liability for terminal dividends) should be separately disclosed in a footnote with a description of each amount and an explanation of its projected use and any other potential uses (e.g., reducing premiums, determining and declaring dividends available, and/or reducing federal support in the form of appropriations related to administrative cost or subsidies).

****
APPENDIX A: BASIS FOR CONCLUSIONS
****

122 This appendix summarizes considerations deemed significant by the Board in reaching the conclusions in this Statement. It includes reasons for accepting certain approaches and rejecting others. Individual members gave greater weight to some factors than to others.

123 This Statement addresses recognition and measurement of liabilities in the general purpose financial reports of federal reporting entities. The unique circumstances of the federal government, most notably its role as the vehicle through which citizens express their sovereign power, meant that the Board had to resolve some

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

new issues in order to define exactly how to apply accrual concepts in federal financial reports.

124 The Board's deliberations on liabilities were based on certain ideas about the distinction between exchange and nonexchange transactions, the importance of reporting cost of services provided by the federal government, and the impact of information on decisionmakers. These ideas are explained in the following paragraphs.

125 Many users of federal financial reports are familiar with accounting concepts and standards published by the Financial Accounting Standards Board (FASB) for private sector entities, and the Governmental Accounting Standards Board (GASB) for state and local government entities. Because such users might assume that identical concepts and standards are used by the federal government if differences are not explained clearly, this appendix compares certain concepts underlying the federal standard with concepts that govern recognition and measurement of liabilities in financial reports of private sector entities and state and local governments in the United States. Finally, this appendix also explains the basis for specific conclusions regarding social insurance, contingencies, federal employee pensions, other retirement benefits, other postemployment benefits, and insurance and guarantee programs.

EXCHANGE AND NONEXCHANGE TRANSACTIONS

126 As noted in SFFAC No. 1, "Objectives of Federal Financial Reporting": "The accounting process begins with recording information about transactions between the government (or one of its component entities) and other entities, that is, inflows and outflows of resources or promises to provide them."[FN 63: P. 53, paragraph (16c).] In some transactions, consideration of value is exchanged: there is a reciprocal or two-way flow. Other transactions, such as grants and other transfer payments are nonexchange transactions (i.e., there is a nonreciprocal transaction--

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

normally a one-way flow).

127 The federal government is the vehicle through which citizens of the nation exercise their sovereign power. In this role, the federal government is responsible for taking collective action at the national level "to promote the general welfare. "Thus the government undertakes many programs that do not involve reciprocal transfers between the government as an entity and its counterparties. Examples include disaster relief, grants to state and local governments, subsidies, and other transfer programs for individuals. The federal government has a propensity to assume such burdens because it is the agent by which the society, through its elected officials, accomplishes transfers between groups of citizens to enhance their well-being.

128 A taxpayer or a donor may, in fact, receive a benefit of some sort, such as the opportunity to live in a safe, secure environment; to improve one's standard of living; and to receive specific benefits, such as visits to national parks and travel over highways. But it is not ordinarily said that the benefit to the individual taxpayer or donor is of value comparable to that of the consideration given. Therefore, these are classified as nonexchange transactions. For this Statement, the significance of the distinction between exchange and nonexchange transactions arises from the nature of the obligation that is created when one party to a transaction provides a product or service to the other party in return for a promise that something of value will be exchanged for it.

129 Obligations become legally enforceable claims against the federal government in different ways and at different points within transaction cycles that relate to various programs. An important factor in distinguishing between various programs is whether an exchange is involved. For example, the federal government may not contract for and receive goods or services and then arbitrarily decide not to honor the contract. Similarly,

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

under existing law, the federal government may be financially responsible for certain damage and injury it causes.

130 In other cases, the obligation may be more a matter of what is perceived as equitable and good public policy than a legally enforceable claim. Although there may be a high probability that a grant, a subsidy, or an income transfer will be made or will continue in future years, the recipients of such grants, subsidies, or transfers do not have a right to receive such payments in the future from the federal government as do those who receive payments in exchange for service they have performed.

131 However, it is possible to make meaningful estimates of the future amounts required to continue present policies regarding such programs. These estimates are relevant to certain decisions and should be disclosed or otherwise reported, as discussed further in "Supplementary Stewardship Reporting." In the context of the Board's definition, however, estimates of future nonexchange payments should not be recognized as a current period liability. On the other hand, any payments due as a result of past events but unpaid at the end of the period constitute a liability.

132 In the case of federal liabilities, some future outflows of resources are so likely that they should be recognized as accounting liabilities in general purpose federal financial reports before all the other events necessary to create a legally enforceable claim against the government exists.[FN 64: Notwithstanding an expectation that the appropriations will be made, whether they in fact will be made is completely at the discretion of the Congress.] Two important examples of such substantive accounting liabilities are the pensions and retirement health care promised federal workers in return for their service.

133 An exchange can in substance be said to have occurred in such cases, even if the government has

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

not yet made an outlay of cash or other financial resources. Service has been exchanged for a promise of future payment or health care. Such charges are properly assignable to the current period in financial reports. This exchange implies, for example, that general purpose federal financial reports should recognize the financial effects of the promise to provide health care to retired federal workers as that obligation accrues during their years of service, regardless of whether the budget includes a provision for this item. This is true even though unfunded liabilities of the federal government reported on the financial statements cannot be liquidated without the enactment of an appropriation. Also, as a sovereign entity, the payment of all liabilities other than for contracts can be abrogated by the federal government.

CONCLUSION ON SOCIAL INSURANCE

134 The recognition, measurement and display of obligations for social insurance programs presented the Board with significant theoretical and practical problems. From the theoretical perspective, the Board considered whether social insurance programs resulted in exchange or nonexchange transactions, or whether they contained both exchange and nonexchange features. The Board also considered the problems of articulation between the operating statement and the Balance Sheet, specifically whether the process of reporting a year-to-year change in a Balance Sheet liability might affect the usefulness of an operating statement measure of performance. Finally, the Board considered the difficulty of determining an appropriate measure of the obligation assumed, whether such a measure were to be presented on the face of the Balance Sheet or in the notes.

135 In the exposure draft "Accounting for Liabilities of the Federal Government", the majority of the Board concluded that social insurance programs were entitlement programs developed to carry out the sovereign

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

responsibilities of the government, financed primarily by compulsory earmarked taxes. The Board favored characterizing social insurance obligations as nonexchange transactions, and limiting recognition of a liability to any unpaid amounts due as of the reporting date. A significant majority of the respondents, however, agreed with an alternative view, which expressed the notion that social insurance programs contained both exchange and nonexchange features, and that there was a need for recognizing a liability at least equal to the present value of future payments due to recipients currently eligible for benefits.

136 Upon reconsideration of the issues, the Board concluded that the most appropriate approach from both the Balance Sheet and Statement of Net Cost perspectives would be: (1) to include a line item entitled "social insurance obligations" in a separate section of the Balance Sheet following the liability section and before the equity section; (2) to make note disclosure of supplementary data resulting from several approaches for measuring the obligation, and (3) to report the annual financial outflows of current financial resources on the Statement of Net Cost. The Board also decided that, given the sensitivity and magnitude of social insurance, this new position should receive additional exposure, to allow users to review it and comment. The Board felt that the concepts and alternatives had not yet been presented to the user community in sufficient detail. Hence, the discussion of social insurance has been withdrawn from the liability standard and consolidated in "Supplementary Stewardship Reporting."

IMPACT OF COMMUNICATING INFORMATION IN GENERAL PURPOSE FEDERAL FINANCIAL REPORTS

137 FASAB recognizes that extensive information about probable and possible future federal outlays is available now in many special purpose reports on various federal programs. In that sense, the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

financial reports prepared pursuant to this Statement are not likely to reveal information that is new in an absolute sense. Analysts working for the various executive agencies, congressional committees, private interest groups, "think tanks" and universities are, collectively, aware of this information and much more. Nevertheless, the Board believes that presenting liabilities and stewardship responsibilities in the general purpose federal financial reports can be valuable in several ways. There are at least four reasons for this belief.

138 First, analysts typically know a lot about certain programs, but only those programs. Currently it is difficult, if not impossible, to assemble comprehensive information prepared on a comparable basis for the federal government as a whole. In many cases, this is also true for significant component units. General purpose federal financial reports attempt to provide a way of presenting comprehensive information.

139 Second, much of this information has no impact on individual decisionmakers, such as program managers, unless it is conveyed in a way that facilitates, or even requires, suitable attention to it. For example, information about federal pension plans and retirement benefits conveyed in an actuarial report or in the narrative section of the "Budget of the United States Government" may have an impact on certain congressional decisions, but is unlikely to influence managers' decisions about whether to use federal employees, invest in labor-saving equipment, or contract out to accomplish a given task. If the information is to have such an impact, it must be reported in a way more directly associated with the activities the manager is responsible for. Associating the expenses and liabilities reported in the general purpose federal financial report with the outputs of responsibility centers is able to accomplish this direct association.

140 Third, the mere requirement to assemble and

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

report these data will, in some cases, affect federal managers, who, like everyone, tend to manage what they measure. Some observers believe, for example, that the prospect of having to comply with FASB's Statement 106, "Employers' Accounting for Postretirement Benefits Other Than Pensions," caused corporate managers and others to focus increased attention on the need to manage the cost of promises they had made to provide health care to retirees, even before the statement became effective.

141 Fourth, financial reports prepared and audited pursuant to federal accounting standards may reasonably be expected to possess a certain credibility and to command a certain amount of attention from various users, sufficient to affect decisions about federal government public policy. They will provide a source of information that should complement what is provided by the "Budget of the United States Government." An important collateral benefit arises from the processes of preparing, auditing, and publishing annual financial statements. Experience demonstrates that these processes improve the reliability of information and of control systems, thereby enhancing both decisionmaking and accountability in general.

RELATIONSHIP TO LIABILITY RECOGNITION PRINCIPLES USED BY NONFEDERAL ENTITIES

142 FASB defines the basic principles that govern liability recognition by private sector entities in the United States.[FN 65: The Governmental Accounting Standards Board (GASB) has not published a concept statement on financial statement elements as FASB has done in Concept Statement Number 6 and has not defined "liability" per se. In the current state and local governmental accounting model, a fund liability is "the amount left unpaid at the end of the reporting period that normally would be liquidated with expendable available financial resources. The remainder of the liability should be reported

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

in the General Long-Term Debt Account Group (GLTDAG)." National Council on Government Accounting Statement (NCGAS) Number 4, par. 17. (See GASB "Codification of Governmental Accounting and Financial Reporting Standards", section 1500.)] Government corporations follow those standards in their separately issued financial statements. Probably most readers of this Statement are familiar with these principles. Probably most users of federal financial reports are accustomed to seeing other financial reports prepared according to these principles.

143 FASAB's principle for liability recognition differs from FASB's. The difference can be seen as a modification made necessary by the sovereign nature of the federal government. FASAB contemplates a liability standard within the context of a reporting model that provides much greater emphasis on publicly reporting certain stewardship responsibilities than does the reporting model used by private sector organizations. This kind of reporting model is necessary because of the federal government's responsibility for the general welfare of the nation and its resulting willingness to take on obligations.

CONCLUSION ON CONTINGENCIES

144 In the Exposure Draft the Board asked the following question. "When an estimated [contingent] liability is a range of amounts and no amount within the range is a better estimate than any other amount, should either the midpoint or, alternatively, the 'expected value' (as the term is used in statistics) be recognized as a liability instead of the minimum amount?" The majority of respondents preferred the expected value and the second preference was the minimum amount.

145 The Board further considered all of the options. Based on the Board discussions it was noted that it would be difficult to use "expected value" to pinpoint an estimate within a range.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

The expected value method would assign a probability percentage to each of the numbers within the range, but these probabilities would usually be difficult to estimate.

146 After much discussion the majority of the Board preferred the minimum amount because of its established use in other accounting standards. The Board decided that liabilities arising from nonexchange transactions would be recognized for any unpaid amounts due as of the reporting date. This includes amounts payable from the federal entity to pay for benefits, goods, or services[FN 66: Goods or services may be provided under the terms of the program in the form of, for example, contractors providing a service for the government on the behalf of disaster relief beneficiaries.] provided under the terms of the program, as of the federal entity's reporting date, whether or not such amounts have been reported to the federal entity (for example, estimated Medicaid payments due to health providers that will be financed by

the federal entity but have not yet been reported to the federal entity).

147 In the case of government-acknowledged events giving rise to nonexchange or exchange transactions, there must be a formal acceptance of financial responsibility by the federal government, as when the Congress has appropriated or authorized (i.e., through authorization legislation) resources. Furthermore, exchange transactions that arise from government-acknowledged events would be recognized as a liability when goods or services are provided. For nonexchange transactions a liability would then be recognized at the point the amount is due. Therefore, government-acknowledged events do not meet the recognition criteria necessary to be recognized as a contingent liability. The government is acting in its sovereign capacity when it assumes financial responsibility and makes income transfer payments or provides other nonexchange benefits. The Board does not believe that accounting recognition should anticipate sovereign actions in advance of occurrence.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

CONCLUSION ON PENSIONS, OTHER RETIREMENT BENEFITS AND OTHER POSTEMPLOYMENT BENEFITS

Pensions - Projected Salary Levels

148 A primary objective for federal financial reporting is to measure accurately the full cost of employer entity services to the public. The methods used to account for pensions, ORB, and OPEB in general purpose financial reports should accurately measure the full cost of an employer entity's services. Since federal pension benefits are based on final salaries, whatever method is used for the annual cost and accrued liability of federal pensions must include projected future salaries that reflect an estimate of the compensation levels of the individual employees involved (including future changes attributable to the general price level, seniority, promotion, and other factors). They are part of the obligation that the federal government is incurring.

Accounting for the Pension Plan

Attribution Methods

149 The major federal pension plans use an actuarial cost method for funding purposes known as aggregate entry age normal (AEAN). Various actuarial cost methods exist. All the methods regarded as acceptable methods for advance funding of private pension plans recognize the cost of an employee's pension benefits during the employee's years of service, but the different actuarial methods recognize the cost in different patterns over time. The AEAN method is intended to produce a periodic pension cost that is a level percent of payroll.

150 That is, AEAN is a method under which the present value of projected benefits of each employee is allocated on a level basis (such as a constant percentage of salary) over the service of the employee between entry age and assumed exit

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

age. The portion of this present value allocated to each year is called the normal cost. The portion of this present value not provided for at a valuation date by the present value of future normal cost is called the actuarial accrued liability.

151 FASAB considered the method used by the Financial Accounting Standards Board in Statement of Financial Accounting Standards (SFAS) No. 87, "Employer Accounting for Pensions" (the projected unit credit, or PUC), as well as AEAN. FASB concluded that PUC gave a better measure of the employer's obligation for the benefits earned by the employees at a particular point in time. It therefore said that PUC provides a better measure of the value of the benefits that accrue during the year. However, FASAB heard testimony from an OPM actuary that results from these two methods were similar for federal plans. FASAB concluded that AEAN is a sound measure of the accruing expense.

152 FASAB concluded that any method of assigning the value of benefits that are earned over the entire career to particular years of service involves a process of estimation. It is, of course, reasonable to assume that the benefits accrue in some sort of systematic and uniform fashion and not, for example, all at once when the employee becomes eligible. Assuming that the benefits accrue as a uniform percentage of salary each year (as is done with AEAN for pensions) is a reasonable approach. AEAN is particularly useful within an organization when measuring costs over time because it provides that a dollar of salary always equals a fixed percent of pension, regardless of the year involved. Thus, inflation is factored into the calculation automatically.

153 FASAB specified the AEAN for several reasons. First, as stated, AEAN is a reasonable and systematic way of allocating costs evenly over the service lives of employees. Second, the major federal retirement systems [the Military Retirement System (MRS), the Civil Service

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

Retirement System (CSRS), and the Federal Employees Retirement System (FERS)] use AEAN, and in two cases (FERS and MRS) charge "full cost" in the budget under a statutory requirement.[FN 67: The CSRS statute calls for procedures that are generally construed as entry age normal. "Full cost," of course, depends on the method selected. For example, prior service cost is amortized in FERS over 30 years pursuant to the funding method; it would be recognized over a shorter period (years of expected future service of the group or 15 years) under SFAS 87. It should be recognized in full immediately under the terms of this standard, but only in financial reports of the agency that administers the pension plan and in the consolidated financial statements of the United States, not in the employer agency's financial statements. Thus, "full cost" in this sentence must be read in a generic way, that is, as a statement of the general intent underlying the law.] Finally, exact comparability with private-sector entities is not relevant. Minor differences in the size of the pension liability and expense calculated pursuant to this Statement and SFAS 87 clearly would not have a material impact on investor's assessment of the credit-worthiness of the U. S. government.

154 Since there are several acceptable attribution methods and several small pension plans in addition to the three major plans, FASAB decided that the use of methods other than AEAN was permitted provided the results were not materially different from those of AEAN. A material difference between the expenses and the liabilities for federal plans based solely on the choice of attribution method would destroy the comparability and impair the usefulness of the information for users other than investors.

155 FASAB recognizes also that other attribution methods might be useful for other purposes. For example, a method that calculates the vested benefits accrued by employees to date, at current salary levels, would be useful as a measure of the accumulated amount the plan would owe if it were

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

to terminate. Such calculations would be for special purpose reports not covered by this Statement.

Assumptions

156 There are three objectives for actuarial assumptions. First, FASAB considers it extremely useful to have consistent assumptions among accounting, budgeting, and actuarial statements to the extent it is possible to do so while attaining the objectives of federal financial reporting.

157 Second, assumptions ought to be consistent across federal employee retirement systems. Assumptions need not be identical because the conditions facing each plan may objectively differ, but they should be rationally related (thus, the standard calls for financial reports to be prepared on the basis of the best available estimates for actuarial assumptions). Also, the standard allows the smaller plans to use the assumptions provided by any of the three primary plans or to use their own assumptions if they explain how and why they are different from one of the major plans.

158 Third, assumptions ought to reflect the underlying economic substance of the transaction. They should reflect the entity's past experience and current expectations regarding cost trends. They should reflect the similarities of and differences between two sets of economic phenomena rather than forcing artificial uniformity.

159 FASAB concluded also that the discount rate should reflect the long-term expected return on plan assets rather than a current market rate on debt of comparable maturity (the discount rate called for by SFAS 87). The long-term expected rate reduces volatility, reflects the actual experience and expectations of the primary federal plans, and is consistent with the assumptions used in the budget. The Governmental Accounting Standards Board uses a similar approach for the discount rate for state and local government

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

pensions for similar reasons.

Prior Service Cost

160 Prior service costs (or gains) are the costs (or gains) of retroactive benefits granted (or reduced) in a plan amendment. Under the current budgetary system, prior service costs are funded in the budget through General Fund appropriations over 30 years. The employer entities under MRS and FERS--which are intended to be fully funded--are not charged in their budgets for prior service cost (nor are they credited for gains), but rather the General Fund is charged for these costs. [FN 68: CSRS also receives General Fund appropriations for this purpose, but the appropriations are based on statutory provisions and are less than they would be under a fully funded approach. Because of this, the CSRS funding approach is not being used as an example of budgetary treatment to be contrasted with the accounting treatment.]

161 As stated in the Statement, FASAB believes that prior service costs, interest on the pension (or ORB) liability, and actuarial gains and losses are expenses of the federal government as a whole and are best accounted for by the administrative entity. Some respondents did not agree that employer entities should recognize only the "normal" or "service" cost element. The respondents suggested that the employer entity should recognize all elements of the pension (or ORB) expense: service costs, prior service costs, actuarial gains and losses, and interest on the pension liability. In general, these respondents believe that the full cost of products and services produced by the employer entity includes these elements, and that the full cost thus defined is relevant to various decisions such as comparing the cost of outputs and services with alternative providers.

162 The Board considered these views, but it continues to believe that employer component entities of the U. S. Government should usually recognize only the service cost element of pension

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

(and ORB) expense in their general purpose financial reports. (Exceptions will arise in cases such as the Coast Guard, where the employer entity is also the administrative entity for the plan). The Board is aware that its approach may appear to differ from the approaches taken by FASB and GASB in this regard. However, neither of those Boards focused, in their standards on pensions and other retirement benefits, on reporting by component entities of a larger reporting entity comparable to the Government of the United States. All elements of pension (and ORB) expense should be recognized in the consolidated financial statements of the United States Government; however, the Board believes that prior service cost and other non-service cost are not useful for most managerial or policy decisions at the program level. They are sunk costs (or sunk gains) attributable to services rendered in prior years, or otherwise are not under the control of program management. FASAB continues to believe that having non-service elements of cost reported by the administrative entity best reflects the federal environment and organizational structure.

163 The Board recognizes that some analysts might, for some purposes, want to consider an alternative measure of compensation cost, e.g., one that includes interest on the part of the pension (or ORB) liability that relates to current workers, or one that recognizes some non-service costs over the workers' years of expected service. Special analyses and reports will always be necessary for special purposes. General purpose financial reports must, by definition, focus on the most common needs of users of those reports.

164 For similar reasons, FASAB also continues to believe that prior service costs (or gains) should be recognized immediately, without amortization, by the administrative entity, and in federal government-wide financial reports. FASAB sees no benefit to delaying recognition of a cost and a liability or to reducing volatility in the general purpose financial report of the administrative

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

entity. FASAB was not persuaded that the benefit (or the cost) derived in future periods from increased (or deceased) pension benefits was sufficiently tangible in the federal context to warrant delayed recognition by means of amortization over future periods. Examples of plausible future benefits or costs would be, increased (decreased) employee productivity or reduced (increased) turnover.

165 FASAB recognizes that, for funding purposes, prior service costs for CSRS, FERS, and MRS are amortized through appropriations over a number of years. Funding decisions, however, should not be determinative for accounting recognition of cost. Deciding when and how to fund an obligation is not an accounting issue.

Actuarial Gains and Losses

166 Actuarial gains and losses result from (1) deviations between actual experience and the actuarial assumptions used and (2) changes in actuarial assumptions. Actuarial assumptions are essentially long-range estimates about future events and necessarily vary from actual experience.

167 Actuarial gains and losses and prior service costs (or gains) have similar characteristics. They are both determined after the accounting period in question has concluded, and both relate to the past (either prior service or prior experience). The difference between actuarial gains and losses and prior service costs (or gains) is that the former are the normal result of actuarial estimation and may occur annually, while prior service costs are incurred only when the plan is amended. Also, actuarial gains and losses may tend to even out over time, unlike prior service costs.

168 FASAB concluded that actuarial gains and losses should receive the same treatment as prior service costs (or gains). They should be charged to the administrative entity. The employer

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

entities should recognize an expense only for the service cost[FN 69: "Service cost" is defined as the actuarial present value of benefits attributed by the plan's benefits formula to services rendered by employees during an accounting period. The term is synonymous with "normal cost".] of their employees for the period less the amount contributed by the employees, if any. Like prior service costs, the actuarial losses are sunk costs (or sunk gains) attributable to services rendered in prior years and therefore should be excluded from data used for managerial or policy decisions.

169 For the same reasons as were given for prior service costs, actuarial gains and losses should be recognized immediately by the administrative entity. There is no benefit in delaying recognition or reducing volatility in the cost measures and the financial reports of the administrative entity.

Recognition and Measurement

170 The Board's conclusions discussed immediately above are reflected in the accounting treatment of pensions. The employer entity should recognize an annual pension expense as a cost of operations. When the employer entity's contributions are less than its pension expense, the employer entity should recognize an imputed financing source for the expenses paid by other entities. To the extent that it receives contributions from the employer entity, the administrative entity should recognize an intragovernmental revenue.

171 These transactions are intragovernmental. For purposes of federal government-wide consolidated financial reports, the employer's pension expense should be offset against (1) the administrative entity's contributions received from employer entities and (2) the employer entity's imputed financing source, if applicable.

172 The administrative entity should report the pension liability. An increase in the liability

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

during the accounting period is an expense to the administrative entity. The liability is increased by the net total of the pension cost components [normal cost, interest on the pension obligation, prior service costs (gains), and actuarial gains (losses)]. Thus, the administrative entity should be providing information not only about the actuarial liability but also about the relationship between the full cost and the revenue from employees, employer entities, interest, and Treasury contributions.

173 Recognizing the pension cost components in the administrative entity and also the normal cost in the employer entities accomplishes two objectives. First, the full cost and actuarial liability are summarized and presented in one place, i.e., in the administrative entity's operating results and Balance Sheet. Second, each employer entity reports its respective normal cost as a cost of providing service. This is essential to report properly the cost of delivering federal government services. These entries are eliminated during consolidation for federal government-wide financial statements and, thus, no double counting occurs.

Other Retirement Benefits

174 FASAB concluded that ORB are similar to pension benefits and should be accounted for in a similar way unless differences in substance dictate otherwise. The predominant other retirement benefit in the federal government is health care benefits for retirees. These are long-term and require actuarial estimation.

175 FASAB recognizes that future health care benefits present unique measurement problems. They are more uncertain than pensions since they depend on the changing patterns of health care delivery and utilization, on the price trends for medical care, and on the benefits provided by social insurance programs like Medicare.

176 Also, some federal retiree health benefits

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

are provided directly in federal government hospitals and domiciliary facilities. The liability in these cases also depends on the amount that the Congress will appropriate in the future to pay for the benefits, so the expense and liability are more difficult to measure. Notwithstanding the measurement difficulties, because of the importance of approximating the cost of services rendered at the time the service is rendered, FASAB believes that in most cases, the ORB costs and liabilities should be measured for federal programs. However, as noted in the discussion starting with paragraph 182, VA medical care cost would be recognized in the period medical care service is rendered.

ACCOUNTING FOR THE OTHER RETIREMENT BENEFITS PLAN

Attribution Method

177 Unlike the situation regarding federal pension plans, there is no established attribution method for federal retirement medical care. Although there are current proposals to do so, the costs are not currently being funded.

178 For retirement health care, FASAB found no compelling reason to prefer an approach other than the aggregate entry age normal used for pensions. The employer's service cost however, should be calculated differently for health care than for pensions. For the pensions, costs are calculated as a percent of payroll, but retirement health care benefits are paid for each individual retiree regardless of prior salary. Cost, therefore, should be calculated on a per person basis because that accurately represents how the cost is incurred.

Assumptions

179 Although the general assumptions employed for ORB should be the same as those for pensions, the health care cost trend assumption is unique. The standard gives general guidance regarding the use

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

of "Medicare projections or other authoritative sources" for the trend assumption in order to achieve consistency and set broad guidelines for the estimates. The health care cost assumption should reflect these sources adjusted for any factors unique to the organization.

Other Postemployment Benefits

180 OPEB represent operating expenses of the federal employer entity. Some might argue that OPEB, like pensions and ORB, should be accrued as employees perform services, as a cost of operations, because (1) they believe the event is occurring as the employees perform service, (2) future OPEB payments are probable, and (3) they can be measured. FASAB was not persuaded that there was an adequate nexus between these cost and the employee's daily, ongoing service; or that these costs were sufficiently probable at that point to warrant accrual.

181 FASAB believes that an accrual based on the occurrence of an actual event, such as a job-related injury or a decision to reduce the entity's workforce generally, is a reasonable approach. Such an event makes the future outflow of resources probable and measurable, may involve long-term accruals in some cases, and provides an accurate measure of expense in a way that is the least burdensome to the reporting entities. [FN 70: The federal workers' compensation and unemployment insurance programs are different from the programs applicable to nonfederal workers. The benefits for federal employees under these programs are financed by direct reimbursement from employer entities. Usually the reimbursement period for workers' and unemployment compensation is short-term, but under certain conditions, workers' compensation may extend for many years.]

VA MEDICAL CARE COST

182 Although it might appear that medical benefits provided by the Department of Veterans Affairs should be treated like other retirement or

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

medical benefits, there are significant differences between the two. Most often retiree medical benefits are provided through a health insurance provider, which receives premium payments from the former employer. But, with VA medical benefits, the former employer (the government) provides the medical services through VA facilities to veterans on an "as needed" and an "as available" basis versus payment of health insurance premiums for each veteran.

183 Eligibility for VA hospital care and nursing-home care is divided into mandatory and discretionary categories. VA must provide hospital care to veterans with service-connected disabilities and others in the mandatory category. Hospital care is considered discretionary if the veteran has income above a specified limit and a non-service-connected injury. Veterans in the discretionary category may be required to pay fees to receive VA hospital care. In addition, VA medical care is financed by annual appropriations. The entitlement to receive care does not guarantee any particular level of care. The Congress decides annually how adequately VA medical care will be funded.

184 The Board believes that VA medical benefits, for both mandatory and discretionary programs, are best measured by the annual cost incurred rather than by actuarially determined charges during the veteran's military service. Medical care for veterans does not satisfy the probability or reasonably measurable criteria in this standard at earlier dates, and therefore future medical benefits do not constitute a long-term liability to be recognized in the Balance Sheet. The Board believes VA medical benefit liability and related expenses should be recognized in the period medical care service is rendered. The entity should consider, however, what disclosures would be appropriate for these costs under the contingency standard.

CONCLUSION ON INSURANCE AND GUARANTEES

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

185 The Board considered two possible bases for recognizing the liability of federal insurance programs. One would recognize as a liability the unpaid expected present value (PV) cost of insured events that had occurred. The second would recognize as a liability the unpaid expected PV cost of risks that had been assumed (i.e., the unpaid expected PV cost inherent in insurance extended or in force). This second approach would be similar to that taken by the Congress in budgeting for direct loans and loan guarantees and by FASAB in accounting for these transactions. (See Statement of Federal Financial Accounting Standards Number 2, "Accounting for Direct Loans and Loan Guarantees").

186 Several Board members believe that this second approach has merit from a conceptual standpoint. However, the Board has concerns about the measurability of the risk assumed, particularly in the context of pension guarantees. There may also be some question as to the exact nature or categorization of some assumed risks in the absence of written contracts. The Board concluded that it would continue the traditional practice of recognizing the effect of events that had occurred on the face of the financial statements. However, it also decided to require reporting as RSSI the estimated PV cost of the risk assumed for all programs, except social insurance, life insurance, and loan guarantee programs.

187 Accrual accounting for insurance programs attempts to report the expenses of operations for each period and the unpaid liability at the end of the period. Projections of future claims, including renewed, expanded, and new business, also provide important information for policy decisions about what rates should be charged to cover all expected future losses, what additional insurance should be extended, and similar decisions. Management of reporting entities may wish to include such projections in financial reports as other accompanying information, and may do so on a voluntary basis, but the Board is not

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

presently making any specific recommendations about this, beyond those required by this Statement and those to be further considered in "Supplementary Stewardship Reporting."

188 During the Exposure Draft stage of the Liability Standard, the Board asked respondents whether the Standard provided sufficient guidance on how the risk assumed amount should be measured. Two of the fifty five respondents asked for additional guidance but did not mention measurement possibilities.

189 At the discussion stages of the final Statement the Board contemplated two possible measurement perspectives for reporting the risk assumed. The Statement requires that all federal insurance programs (except social insurance, life insurance, and loan guarantee programs) report the risk assumed amount as supplementary information. The risk assumed calculation as presented in the Exposure Draft measured the cost of the coverage outstanding during the reporting year. For annual term insurance programs, under this approach the risk assumed amount might not be significantly different from the sum of recognized liabilities and contingent liabilities reported on the Balance Sheet. However, the Board believes that requiring disclosure or supplementary reporting of a risk assumed number that is similar in concept and amount to the liability recognized could be confusing and would not add informational value.

190 In the second perspective, the risk assumed amount would be a broader and longer term measure of the government's potential cost for on-going insurance programs. Under some measures, this second approach to risk assumed could be regarded as an indicator of the "fair" or "full cost" premium that should be charged if taxpayers are not to subsidize the program. This measure would be a probabilistic estimate of the expected cost under certain assumed economic factors. The Board found merits in this calculation, and believes it can provide important additional information beyond that contained in the accrual. Although

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

they believe the measure to be important, proponents of this approach acknowledge that the measure may be difficult to measure precisely. Accordingly, they would treat it as RSSI. The Board currently has a project at the Exposure Draft stage, "Supplementary Stewardship Reporting", that will provide further details on the measurement and reporting of "risk assumed" in its final statement.

191 The Board also considered the liability recognition of whole life insurance programs. The federal government has a small number of whole life insurance programs that are administered by federal entities. The most significant programs (mutual enterprise-type whole life insurance) are through the Department of Veteran Affairs (VA).

192 At the time the exposure draft on liabilities was issued, there were no established accounting standards for mutual enterprise-type whole life insurance within the federal government, state and local government, or the private sector. Therefore VA followed the statutory requirements for accounting purposes as well as statutory insurance reporting.

193 In January 1995, the FASB and AICPA issued a standard and a statement of position, respectively, that specified accounting for mutual whole life insurance enterprises. Due to the similarities between the federal programs and the insurance enterprises covered in the FASB and AICPA documents, the Board decided that the private sector standards would be appropriate for the applicable federal programs. Therefore the Board concluded that federal entities with whole life insurance programs would follow the standards as prescribed in the private sector standards (and as these private sector standards are amended) when reporting the liability for future policy benefits, along with the additional disclosures prescribed by this Statement. The Board further concluded that disclosure of the components of the liability was necessary to adequately inform the financial statement users of the projected use and

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

any other potential uses of the liability components and associated assets.

****

APPENDIX B: LIABILITY RECOGNITION AND MEASUREMENT MATRIX

****

********** APPENDIX B: "LIABILITY RECOGNITION AND MEASUREMENT MATRIX APPEARED HERE IN THE HARD COPY TEXT **********

****

GLOSSARY

****

Actuarial cost methods - A recognized actuarial technique used for establishing the amount and the incidence of employer contributions or accounting charges for pension costs under a pension plan.

Actuarial liability - A liability based on statistical calculations and actuarial assumptions (actuarial assumptions are conditions used to resolve uncertainties in the absence of information concerning future events affecting insurance, pension expenses, etc.). (Adapted from "Webster's Ninth New Collegiate Dictionary" and "Kohler's Dictionary for Accountants" sixth edition, [Cooper & Ijiri])

Actuarial present value - The value of an amount or series of amounts payable or receivable at various times, determined as of a given date by the application of a particular set of actuarial assumptions. (Actuarial Standards of Practice No. 4)

Aggregate entry age normal - A system of applying the entry age normal actuarial cost methodology using aggregate population models or groups instead of applying it individual by individual.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

Attribution - The process of assigning pension benefits or costs to periods of employee service. [SFAS 87]

Budget Authority - The authority provided by federal law to incur financial obligations, as follows:

-- Provisions of law that make funds available for obligation and expenditure (other than borrowing authority), including the authority to obligate and expend the proceeds of offsetting receipts and collections.

-- Borrowing authority or authority to borrow and obligate and expend the borrowed funds, including issuance of promissory notes or other monetary credits.

-- Contract authority, or the making of funds available for obligation but not for expenditure. (Statutory authority under which contracts or other obligations may be entered into before an appropriation for the payment of such obligations. The later appropriation provides cash to liquidate such obligations. See OMB Circular A-34.)

-- Offsetting receipts and collections as negative budget authority and the reduction thereof as positive budget authority. (Omnibus Budget Reconciliation Act of 1990 [Pub. L. 101-508], sec. 13211)

Budget authority may be classified by period of availability (1-year, multiple-year, and no-year), by nature of authority (current or permanent), by the manner of determining the amount available (definite or indefinite), or as gross (without reduction of offsetting collections) and net (with reductions of offsetting collections). (SFFAS Number 1, "Accounting for Selected Assets and Liabilities")

Capital leases - Leases that transfer substantially all the benefits and risks of ownership to the lessee.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

Contingency - An existing condition, situation, or set of circumstances involving uncertainty as to possible gain or loss to an entity that will ultimately be resolved when one or more future events occur or fail to occur.

Discount rate - The interest rate used to adjust for the time value of money.

Dividend fund interest rate - The interest rate determined at policy issuance used to determine the amount of the dividend fund. It is the rate used to credit interest to the dividend fund, and against which experience is measured to determine the amount of the interest portion of dividends paid to individual policyholders. [AICPA SOP 95-1, Glossary, p. 33]

Earmarked taxes -Taxes levied by the federal government to finance a specific federal program.

Entitlement program - A program in which the federal government becomes automatically obligated to provide benefits to members of a specific group who meet the requirements established by law.

Entitlement period - The period (such as, monthly) for which benefits become due.

Entry age normal actuarial method - A method under which the actuarial present value of projected benefits of each employee is allocated on a level basis over the earnings or the service of the employee between entry age and assumed exit age. The portion of this actuarial present value allocated to a valuation year is called the normal cost. The portion of this present value not provided for at a valuation date by the present value of future normal cost is called the actuarial accrued liability. The assumption is made under this method that every employee entered the plan (entry age) at the time of initial employment or at the earliest eligibility date, if the plan had been in existence, and that contributions have been made from the entry age to

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

the date of the actuarial valuation. The term "aggregate entry age normal" refers to an approach whereby costs are determined for the group as a whole rather than for each individual participant separately.

Event - A happening of consequence to an entity. It may be an internal event that occurs within an entity, such as the transforming of raw materials into a product. Or it may be an external event that involves interaction between an entity and its environment, such as a transaction with another entity, an act of nature, theft, vandalism, a tort caused by negligence, or an accident. (Adapted from FASB Statement of Financial Accounting Concepts No. 6, "Elements of Financial Statements")

Exchange transaction - A transaction that arises when each party to the transaction sacrifices value and receives value in return.

Executory contract - A contract which has not been performed by all parties to it. (Trascona, Joseph L., "Business Law", William C. Brown C. Publishers, 1981)

Executory costs - Those costs such as insurance, maintenance, and taxes incurred for leased property, whether paid by the lessor or lessee. (SFAS #13)

Expected value - A statistical measurement attribute that is the sum of the products of each potential outcome multiplied by the probability of that potential outcome.

Fixed value securities - Securities that have a known maturity or redemption value at the time of issue.

Government-acknowledged events - Events that are not a liability in themselves, but are those events that are "of financial consequence" to the federal government because it chooses to respond to the event.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

Government-related events - Nontransaction-based events that involve interaction between federal entities and their environment.

Insurance and guarantee programs - Federal government programs that provide protection to individuals or entities against specified risks. Because the federal government frequently commingles aspects of insurance and guarantees within the same program, this Statement treats the terms as a single type of activity. (Also see separate definition of social insurance).

Interest method - Under the interest method of amortization, an amount of interest equal to the carrying amount of the investment times the effective interest rate is calculated for each accounting period. This calculated interest is the effective interest of the investment (referred to as "effective yield" in some literature). The effective interest is compared with the stated interest of the investment. (The stated interest is the interest that is payable to the investor according to the stated interest rate.) The difference between the effective interest and the stated interest is the amount by which the discount or the premium should be amortized (i.e., reduced) for the accounting period. (SFFAS Number 1, "Accounting for Selected Assets and Liabilities").

Liability - For federal accounting purposes, a probable future outflow or other sacrifice of resources as a result of past transactions or events.

Measurable - Reasonably estimable.

Net level premium reserve - The excess, if any, of the present value of future guaranteed death endowment benefits over the present value of future net premiums. The net level premium reserve should be calculated based on the dividend fund interest rate, if determinable, and mortality rates guaranteed in calculating the cash surrender values described in the contracts. [AICPA SOP 95-1]

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

Nonexchange transaction - A transaction that arises when one party to a transaction receives value without giving or promising value in return or one party to a transaction gives or promises value without receiving value in return.

Normal cost - That portion of the actuarial present value of pension plan benefits and expenses that is allocated to a valuation year by the actuarial cost method. (From Actuarial Standard of Practice No. 4)

Operating lease - An agreement conveying the right to use property for a limited time in exchange for periodic rental payments.

Other postemployment benefits (OPEB) - Forms of benefits provided to former or inactive employees, their beneficiaries, and covered dependents outside pension or ORB plans.

Other retirement benefits (ORB) - Forms of benefits, other than retirement income, provided by an employer to retirees. Those benefits may be defined in terms of specified benefits, such as health care, tuition assistance, or legal services, which are provided to retirees as the need for those benefits arises, such as certain health care benefits. Or they may be defined in terms of monetary amounts that become payable on the occurrence of a specified event, such as life insurance benefits. (FASB Statement of Financial Accounting Standard No. 106, "Employers' Accounting for Postretirement Benefits Other than Pensions")

Premium deficiency - A condition under which a liability for future policy benefits using current conditions exceeds the liability for future policy benefits using contract conditions. In such cases, the difference should be recognized as a charge to operations in the current period.

Probable - That which can reasonably be expected or believed to be more likely than not on the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

basis of available evidence or logic but which is neither certain nor proven.

Projected unit credit actuarial method - A method under which the projected benefits of each individual included in an actuarial present valuation are allocated by a consistent formula to valuation years. The actuarial present value of benefits allocated to the valuation year is called the normal cost. The actuarial present value of benefits allocated to all periods before a valuation year is called actuarial liability. (Actuarial Standard of Practice No. 4)

Social insurance programs - Income transfer programs financed by compulsory earmarked taxes and also, in certain cases, general revenues of the federal government. (Also see separate definition of insurance and guarantees).

Terminal dividends - Dividends to policyholders calculated and paid upon termination of a contract, such as on death, surrender, or maturity. If the payment of terminal dividends is probable and the amount can be reasonably estimated, the liability should be recognized. AICPA SOP 95-1.

Transaction - A particular kind of external event involving the transfer of something of value concerning two or more entities. The transfer may be a two way or one way flow of resources or of promises to provide resources. (Adapted from FASB Statement of Financial Accounting Concepts No. 6, "Elements of Financial Statements")

Variable value securities - Securities that have unknown redemption or maturity values at the time of issue. Values of these securities can vary on the basis of regulation or specific language in the offering.

Whole life policies - Policies that provide insurance over the insured's entire life and the proceeds (face amount) are paid only upon death of

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_5.pdf.

the insured.

Gerald Murphy
James E. Reid
Cornelius E. Tierney
Alvin Tucker

The Secretary of the Treasury, the Director of the Office of Management and Budget, and the Comptroller General established the Federal Accounting Standards Advisory Board (the FASAB or "the Board") in October 1990 to consider and recommend accounting principles for the United States Government.

The Board communicates its recommendations by publishing recommended accounting standards after considering the financial and budgetary information needs of Congress, executive branch agencies, and other users of federal financial information. The Board also considers comments from the public on its proposed recommendations, which are published for comment as "exposure drafts." The Board's sponsors, i.e., the officials who established the Board, then decide whether to adopt the recommendations. If they do, the standard is published by the OMB and the GAO and then becomes effective.

Additional background information is available from the FASAB, including: (1) the "Memorandum of Understanding among the General Accounting Office, the Department of the Treasury, and the Office of Management and Budget, on Federal Government Accounting Standards and a Federal Accounting Standards Advisory Board" and (2) the "Mission Statement of the Federal Accounting Standards Advisory Board."

EXECUTIVE SUMMARY

a This statement contains accounting standards for Federally owned property, plant, and equipment (PP&E); deferred maintenance on PP&E; and cleanup costs. Each standard is summarized below.

PROPERTY, PLANT, AND EQUIPMENT

b The Federal Government's investment in PP&E exceeds $1 trillion [SEE NOTE 1] PP&E used for many different purposes. "PP&E" is defined as follows:

> Tangible assets that (1) have an estimated useful life of 2 or more years, (2) are not intended for sale in the ordinary course of business, and (3) are intended to be used or available for use by the entity.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

c The diversity among Federal PP&E creates a need for meaningful categories of PP&E with different accounting standards for each category. The Board identifies four categories of PP&E. The categories are:

- general PP&E are PP&E used to provide general government services or goods;
- Federal mission PP&E are PP&E exhibiting specific characteristics set by the Board;
- heritage assets are those assets possessing significant educational, cultural, or natural characteristics; and
- stewardship land [SEE NOTE 2] (i.e., land other than that included in general PP&E).

d Complete accounting standards for general PP&E are included in this document.

e Federal mission PP&E, heritage assets, and stewardship land are the subject of a project on "Supplementary Stewardship Reporting." An exposure draft (ED) on this topic was issued in August 1995. The Supplementary Stewardship Reporting ED proposes accounting standards for these assets after their acquisition. The accounting standards in this document address (1) classification of PP&E in the categories, (2) accounting for the acquisition cost of PP&E falling into one of these three categories, and (3) implementation of these standards where it affects the basic financial statements. Because Federal mission PP&E, heritage assets, and stewardship land would be subject to supplementary stewardship reporting, they are referred to collectively as stewardship PP&E. This term is used for convenience only since each category has its own definition.

GENERAL PP&E

f The general PP&E category consists of items

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

that:

- could be used for alternative purposes (e.g., by other Federal programs, state or local governments, or non-governmental entities) but are used by the Federal entity to produce goods or services, or to support the mission of the entity; or
- are used in business-type activities; [SEE NOTE 3] or
- are used by entities in activities whose costs can be compared to other entities (e.g., Federal hospitals compared with other hospitals).

g General PP&E includes land acquired for or in connection with other general PP&E. [SEE NOTE 4]

h General PP&E shall be reported in the basic financial statements: the balance sheet, [SEE NOTE 5] and the statement of net cost. [SEE NOTE 6] The acquisition cost of general PP&E shall be recognized [SEE NOTE 7] as an asset. Subsequently, except for land which is a nondepreciable asset, that acquisition cost shall be charged to expense through depreciation. [SEE NOTE 8] The depreciation expense shall be accumulated in a contra asset account--accumulated depreciation.

i The standards provide that certain costs of internally-developed software [SEE NOTE 9] can be capitalized and amortized over a period not to exceed five years. The costs to be capitalized are limited to direct costs incurred after technological feasibility has been established.

j In addition, the standard addresses donations, transfers, and retirements of general PP&E as well as disclosure [SEE NOTE 10] requirements.

STEWARDSHIP PP&E

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

k The following paragraphs describe Federal mission PP&E, heritage assets, and stewardship land, the categories for which supplementary stewardship reporting is being proposed. These standards are limited to accounting requirements for the basic financial statements--they do not address the information to be reported through supplementary stewardship reporting. The accounting standards provide guidance on:

- identifying stewardship PP&E, and
- elements associated with stewardship PP&E that are to be recognized on the basic financial statements (e.g., information shown on the statement of net costs).

Federal Mission PP&E

l Federal mission PP&E are specific types of PP&E identified by the Board (i.e., weapons systems and space exploration equipment) or exhibiting the characteristics established by the Board. [SEE NOTE 11] The Board specifically identified weapons systems and space exploration equipment as Federal mission PP&E because it does not believe applying depreciation accounting would contribute to measuring the cost of outputs produced, or to assessing operating performance, in any given accounting period. The Board believes that these assets are developed, used, and retired in a manner that does not lend itself to a "systematic and rational" assignment of costs to accounting periods (i.e., depreciation accounting) and, ultimately, to outputs.

m The Board did not find any other categories of PP&E that it believed should be explicitly included in the Federal mission category at this time. However, there are other types of PP&E, or PP&E may be developed in the future, that are similar to these two items, so the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

Board has articulated characteristics of Federal mission PP&E. PP&E other than weapons systems and space exploration equipment clearly exhibiting these characteristics should be categorized as Federal mission PP&E. For example, based on comments from respondents and information provided by the Department of Energy, nuclear weapons production facilities do exhibit these characteristics and should be categorized as Federal mission PP&E.

n There are two types of characteristics. The first relates to the use of the PP&E. The second relates to expectations about, and risks associated with, its useful life. To be categorized as Federal mission PP&E, an item should have at least one characteristic from each of the two types of characteristics discussed below.

o Characteristics related to the use of Federal mission PP&E are that the PP&E:

- has no expected nongovernmental alternative uses; or
- is held for use in the event of emergency, war, or natural disaster; or
- is specifically designed for use in a program for which there is no other program or entity (Federal or non-Federal, governmental or nongovernmental) using similar PP&E with which to compare costs.

p Characteristics related to the useful life are that the PP&E:

- has an indeterminate or unpredictable useful life [SEE NOTE 12] due to the manner in which it is used, improved, retired, modified, or maintained; or
- is at a very high risk of being destroyed during use or of premature obsolescence.

q Annual expenditures to acquire, replace or improve Federal mission PP&E shall be shown

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

as a cost in the period incurred. Separating these costs from other period expenses would facilitate analysis of the operating expense and prevent distortion due to large infrequent expenditures.

Heritage Assets

r Heritage assets include PP&E that have historical or natural significance; cultural, educational, or artistic importance; or significant architectural characteristics. Expenditures to acquire, construct, reconstruct, or improve heritage assets shall be reported as a cost in the period incurred. Separating these costs from other period expenses would facilitate analysis of the operating expense and prevent distortion due to large infrequent expenditures.

Multi-use Heritage Assets

s Not all heritage assets are used solely for heritage purposes--some serve two purposes by providing reminders of our heritage and by being used in day-to-day government operations unrelated to the assets themselves. For example, the government has constructed "monumental" style office space, such as the Old Executive Office Building and the Pentagon. Such assets contribute to the day-to-day operations of programs but the cost of these assets can not be easily assigned to heritage and operating purposes.

t The cost of renovating, improving, or reconstructing operating components of heritage assets used in government operations shall be included in general PP&E. Following initial construction, any renovation, improvement or reconstruction costs to facilitate government operations (e.g., installation of communications wiring or redesign of office space) would be capitalized and depreciated over its expected

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

useful life. The cost should not be depreciated over an unrealistically long life.

u Costs of renovating or reconstructing the heritage asset that can not be directly associated with operations shall be considered heritage asset costs. For example, installing a new roof should be considered a heritage asset cost.

Stewardship Land

v The Federal Government has vast holdings of land and puts land to various uses. If land is acquired for or in connection with an item of general PP&E, it shall be categorized as general PP&E. Other land (e.g., land in the public domain and national park or national forest land) shall be excluded from general PP&E and referred to as 4stewardship land.

w The acquisition cost of stewardship land shall be reported as a cost in the period incurred. Separating the cost of land acquisitions from other period expenses would facilitate analysis of the operating expense and prevent distortion due to large infrequent purchases.

DEFERRED MAINTENANCE

x The deferred maintenance standard requires disclosures related to the condition and the estimated cost to remedy deferred maintenance of PP&E. These disclosures are made as a note to a line item on the statement of net costs--no dollar amount shall be recognized on the statement.

y The standards recognize that there are many variables in estimating deferred maintenance amounts. The standards acknowledge that condition rating is a management function

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

since different conditions might be considered acceptable by different entities as well as for different items of PP&E held by the same entity. In addition, management may use condition assessment surveys or life cycle cost plans to estimate the amount of deferred maintenance.

z The deferred maintenance standard applies to all PP&E whether reported on the balance sheet or through supplementary stewardship reporting.

CLEANUP COSTS

aa Cleanup costs are the costs associated with hazardous waste removal, containment, or disposal. In some instances, the Federal Government incurs liabilities [SEE NOTE 13] for cleaning up hazardous waste at sites or facilities it operates or has operated. Generally, cleanup cannot be, or is not, done until permanent or temporary closure or shutdown of sites or facilities. The Board has completed recommended accounting standards for liabilities which address liabilities for environmental cleanup resulting from an accident, natural disaster, or other one-time occurrence. Those liability standards do not address inter-period cost allocation when cleanup relates to operations that span many periods.

ab Therefore, the Board chose to provide additional guidance relative to cleanup costs in this standard. The additional standards in this statement provide for the timing of recognition of the liability and related operating expense.

ac For cleanup costs associated with general PP&E, probable [SEE NOTE 14] and measurable cleanup costs shall be allocated to operating periods benefiting from operations of the general PP&E. This

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

allocation shall be based on a systematic and rational method. For example, the estimated cost could be allocated to operating periods based on the expected physical capacity of the PP&E and the amount of capacity used each period. In addition, disclosure of the total estimated cost is required.

ad For cleanup costs associated with stewardship PP&E, probable and measurable liabilities shall be recognized when the stewardship PP&E is placed in service. Simultaneous to recognizing the liability, the related expense for cleanup cost shall be recognized.

INTRODUCTION

PURPOSE

1 The purpose of this statement is to provide accounting standards for Federally owned

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

property, plant, and equipment (PP&E); deferred maintenance; and cleanup costs. This introduction provides information on:

- the scope of the standards,
- consideration of reporting objectives,
- applicability of the standards,
- capitalization threshold,
- materiality, and
- effective date.

2 Chapters 2, 3, and 4 present the accounting standards for PP&E, deferred maintenance, and cleanup costs respectively.

3 Appendix A presents the Basis for Conclusions. This appendix provides the Board's rationale for the decisions made and responds to the major issues raised in comment letters.

4 Appendix B presents illustrations to aid in categorizing PP&E.

5 Appendix C provides an example of a deferred maintenance disclosure.

6 Appendix D illustrates cleanup cost accounting.

7 Appendix E is a glossary of terms used in this statement.

SCOPE

8 This statement identifies and defines categories of PP&E and addresses recognition and measurement of, and disclosure requirements associated with property, plant, and equipment (as well as land), including accounting for deferred maintenance and cleanup costs. This statement does not address natural resources. However, the Board is undertaking a project to address accounting for natural resources.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

REPORTING OBJECTIVES

9 In drafting accounting standards for PP&E, the Board relied on its Statement of Federal Financial Accounting Concepts Number 1, Objectives of Federal Financial Reporting. Ultimately, all accounting standards taken as a whole will help meet the four reporting objectives expressed in the Objectives statement: budgetary integrity, operating performance, stewardship, and systems and control. The focus of these standards is on the two reporting objectives most relevant to PP&E--operating performance and stewardship. These objectives and how they could be met through PP&E accounting are discussed under the headings (1) operating performance, and (2) stewardship.

OPERATING PERFORMANCE

10 The Board believes that it can contribute to meeting the operating performance objective [SEE NOTE 15] by measuring the cost associated with using property, plant, and equipment and including that cost in entity operating results. The Board first sought to identify PP&E costs that would be appropriate to include in operating expense. Then, from consideration of cost information required, the Board determined what balance sheet information would have to be reported.

11 To meet the operating performance objective, the Board seeks to provide accounting standards that will result in:

- relevant and reliable cost information for decision-making by internal users (e.g., program managers, budget examiners and officials),
- comprehensive, comparable cost information for decision-making and program evaluation

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

by Congress and the public, and
- information to help assess the efficiency and effectiveness of asset management (e.g., condition of assets including deferred maintenance).

STEWARDSHIP

12 The Board believes that Federal financial reporting can fulfill the stewardship objective [SEE NOTE 16] if the Board provides standards that will result in reporting information on:

- asset condition;
- changes in the amount and service potential of property, plant, and equipment;
- cost of property, plant, and equipment where applicable; and
- spending for acquisition of property, plant, and equipment versus non-capital spending.

CAPITALIZATION THRESHOLDS

13 The Board believes that capitalization thresholds should be established by Federal entities rather than centrally by the Board. Because Federal entities are diverse in size and in uses of PP&E, entities must consider their own financial and operational conditions in establishing an appropriate capitalization threshold or thresholds. Once established, this threshold(s) should be consistently followed and disclosed in the financial reports.

APPLICABILITY

14 For guidance on the general applicability of this standard and all other Federal financial accounting standards please refer

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

to Statement of Federal Financial Accounting Concepts No. 2, Entity and Display.

MATERIALITY

15 The provisions of this statement need not be applied to immaterial items.

EFFECTIVE DATE

16 The Board recommends that the accounting standards presented in this proposed statement become effective for periods beginning after September 30, 1997. Earlier implementation is encouraged. In addition, under early implementation individual provisions of the accounting standards may be implemented before other provisions. For example, provisions for stewardship PP&E may be implemented before provisions for general PP&E.

****

CHAPTER 2 -- ACCOUNTING STANDARD
PROPERTY, PLANT, AND EQUIPMENT

DEFINITIONS

17 Property, plant, and equipment consists of tangible assets, including land, that meet the following criteria:

- they have estimated useful lives [SEE NOTE 17] of 2 years or more;
- they are not intended for sale in the ordinary course of operations; and
- they have been acquired or constructed with the intention of being used, or being available for use by the entity.

18 Property, plant, and equipment also includes:

- assets acquired through capital leases

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

(See paragraph 20), including leasehold improvements;
- property owned by the reporting entity in the hands of others (e.g., state and local governments, colleges and universities, or Federal contractors); and
- land rights. [SEE NOTE 18]

19 Property, plant, and equipment excludes items (1) held in anticipation of physical consumption such as operating materials and supplies [SEE NOTE 19] and (2) the Federal entity has a reversionary interest in. [SEE NOTE 20]

20 Capital leases are leases that transfer substantially all the benefits and risks of ownership to the lessee. If, at its inception, a lease meets one or more of the following four criteria, [SEE NOTE 21] the lease should be classified as a capital lease by the lessee. Otherwise, it should be classified as an operating lease. [SEE NOTE 22]

- The lease transfers ownership of the property to the lessee by the end of the lease term.
- The lease contains an option to purchase the leased property at a bargain price.
- The lease term is equal to or greater than 75 percent of the estimated economic life [SEE NOTE 23] of the leased property.
- The present value of rental and other minimum lease payments, excluding that portion of the payments representing executory cost, equals or exceeds 90 percent of the fair value [SEE NOTE 24] of the leased property.

The last two criteria are not applicable when the beginning of the lease term falls within the last 25 percent of the total estimated economic life of the leased property.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

STANDARDS AND CATEGORIES

21 The following paragraphs provide recognition and measurement principles, and disclosure requirements for each category of PP&E. The categories identified are:

- general PP&E (including land acquired for or in connection with other general PP&E),
- Federal mission PP&E,
- heritage assets, and
- stewardship land (i.e., land not included in general PP&E).

22 In determining which category PP&E should be placed in, it will be necessary to identify the "base unit" [SEE NOTE 25] of PP&E against which the category definitions will be applied. For example, units as large as entire facilities or as small as computers could be categorized. In determining the level at which categorization takes place, an entity should consider the cost of maintaining different accounting methods for property and the usefulness of the information, the diversity in the PP&E to be categorized (e.g., useful lives, value, alternative uses), the programs being served by the PP&E, and future disposition of the PP&E (e.g., transferred to other entities or scrapped). [SEE NOTE 26]

GENERAL PROPERTY, PLANT, AND EQUIPMENT

23 General property, plant, and equipment is any property, plant, and equipment used in providing goods or services. General PP&E typically has one or more of the following characteristics:

- it could be used for alternative purposes (e.g., by other Federal programs, state or local governments, or non-governmental entities) but is used to produce goods or

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

services, or to support the mission of the entity, or
- it is used in business-type activities, [SEE NOTE 27] or
- it is used by entities in activities whose costs can be compared [SEE NOTE 28] to those of other entities performing similar activities (e.g., Federal hospital services in comparison to other hospitals).

24 For entities operating as business-type activities, all PP&E shall be categorized as general PP&E whether or not it meets the definition of any other PP&E categories.

25 Land and land rights acquired for or in connection with other general PP&E [SEE NOTE 29] shall be included in general PP&E. In some instance, general PP&E may be built on existing Federal lands. In this case, the land cost would often not be identifiable. In these instances, general PP&E shall include only land and land rights with an identifiable cost that was specifically acquired for or in connection with construction of general PP&E.

Asset Recognition

26 All general PP&E shall be recorded at cost. Cost shall include all costs incurred to bring the PP&E to a form and location suitable for its intended use. For example, the cost of acquiring property, plant, and equipment may include:

- amounts paid to vendors;
- transportation charges to the point of initial use;
- handling and storage costs;
- labor and other direct or indirect production costs (for assets produced or constructed);
- engineering, architectural, and other

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

outside services for designs, plans, specifications, and surveys;
- acquisition and preparation costs of buildings and other facilities;
- an appropriate share of the cost of the equipment and facilities used in construction work;
- fixed equipment and related installation costs required for activities in a building or facility;
- direct costs of inspection, supervision, and administration of construction contracts and construction work;
- legal and recording fees and damage claims;
- fair value of facilities and equipment donated to the government; and
- material amounts of interest costs paid. [SEE NOTE 30]

27 Internally-developed [SEE NOTE 31] software may be included in general PP&E (or other asset accounts [SEE NOTE 32]) if its cost is intended primarily to be recovered through charges to users. [SEE NOTE 33] Other internally-developed software costs shall be expensed when incurred.

28 If an entity elects to capitalize internally-developed software costs under the circumstances described in the preceding paragraph, costs that may be capitalized are limited to:

- those clearly identifiable with major new software projects and distinguishable from recurring maintenance-type activities;
- costs incurred after technological feasibility [SEE NOTE 34] has been established; and
- direct costs of developing the software, initial training material, and documentation manuals incurred after technological feasibility has been established (e.g., salaries of programmers, systems analysts, project

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

management, and administrative personnel directly involved in the planning, designing, coding, or testing; associated employee benefits, outside consultants fees, and supplies).

The amortization or depreciation of these costs shall not exceed five years.

29 The cost of general PP&E acquired under a capital lease shall be equal to the amount recognized as a liability for the capital lease at its inception (i.e., the net present value of the lease payments calculated as specified in the liability standard [SEE NOTE 35] unless the net present value exceeds the fair value of the asset).

30 The cost of general PP&E acquired through donation, devise, [SEE NOTE 36] or judicial process excluding forfeiture (See paragraph 33) shall be estimated fair value at the time acquired by the government.

31 The cost of general PP&E transferred from other Federal entities shall be the cost recorded by the transferring entity for the PP&E net of accumulated depreciation or amortization. If the receiving entity cannot reasonably ascertain those amounts, the cost of the PP&E shall be its fair value at the time transferred.

32 The cost of general PP&E acquired through exchange [SEE NOTE 37] shall be the fair value of the PP&E surrendered at the time of exchange. [SEE NOTE 38] If the fair value of the PP&E acquired is more readily determinable than that of the PP&E surrendered, the cost shall be the fair value of PP&E acquired. If neither fair value is determinable the cost of the PP&E acquired shall be the cost recorded for the PP&E surrendered net of any accumulated depreciation or amortization. Any difference between the net recorded amount of the PP&E

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

surrendered and the cost of the PP&E acquired shall be recognized as a gain or loss. In the event that cash consideration is included in the exchange, the cost of general PP&E acquired shall be increased by the amount of cash consideration surrendered or decreased by the amount of cash consideration received.

33 The cost of general PP&E acquired through forfeiture shall be determined in accordance with Statement of Federal Financial Accounting Standards No. 3, Accounting for Inventory and Related Property (SFFAS 3). [SEE NOTE 39] Amounts recorded for forfeited assets based on SFFAS 3 shall be recognized as the cost of general PP&E when placed into official use.

34 PP&E shall be recognized when title passes to the acquiring entity or when the PP&E is delivered to the entity or to an agent of the entity. [SEE NOTE 40] In the case of constructed PP&E, the PP&E shall be recorded as construction work in process until it is placed in service, at which time the balance shall be transferred to general PP&E.

Expense Recognition

35 Depreciation expense is calculated through the systematic and rational allocation of the cost of general PP&E, less its estimated salvage/residual value, over the estimated useful life of the general PP&E. Depreciation expense shall be recognized on all general PP&E [SEE NOTE 41], except land and land rights of unlimited duration. [SEE NOTE 42]

- Estimates of useful life of general PP&E must consider factors such as physical wear and tear and technological change (e.g., obsolescence).
- Various methods can be used to compute periodic depreciation expense so long as

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

the method is systematic, rational, and best reflects the use of the PP&E.

- Any changes in estimated useful life or salvage/residual value shall be treated prospectively. The change shall be accounted for in the period of the change and future periods. No adjustments shall be made to previously recorded depreciation or amortization.

36 Depreciation expense shall be accumulated in a contra asset [SEE NOTE 43] account--accumulated depreciation. Amortization expense shall be accumulated in a contra asset account--accumulated amortization.

37 Costs which either extend the useful life of existing general PP&E, or enlarge or improve its capacity shall be capitalized and depreciated/amortized over the remaining useful life of the associated general PP&E.

38 In the period of disposal, retirement, or removal from service, general PP&E shall be removed from the asset accounts along with associated accumulated depreciation/amortization. Any difference between the book value of the PP&E and amounts realized [SEE NOTE 44] shall be recognized as a gain or a loss in the period that the general PP&E is disposed of, retired, or removed from service.

39 General PP&E shall be removed from general PP&E accounts along with associated accumulated depreciation/amortization, if prior to disposal, retirement or removal from service, it no longer provides service in the operations of the entity. This could be either because it has suffered damage, becomes obsolete in advance of expectations, or is identified as excess. It shall be recorded in an appropriate asset account at its expected net realizable value. Any difference in the book value of the PP&E and

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

its expected net realizable value shall be recognized as a gain or a loss in the period of adjustment. The expected net realizable value shall be adjusted at the end of each accounting period and any further adjustments in value recognized as a gain or a loss. However, no additional depreciation/amortization shall be taken once such assets are removed from general PP&E in anticipation of disposal, retirement, or removal from service.

Implementation Guidance

40 For existing general PP&E, if historical cost information necessary to comply with the above recognition and measurement provisions has not been maintained, estimates are required. Estimates shall be based on:

- cost of similar assets at the time of acquisition, or
- current cost of similar assets discounted for inflation since the time of acquisition (i.e., deflating current costs to costs at the time of acquisition by general price index).

41 Accumulated depreciation/amortization shall be recorded based on the estimated cost and the number of years the PP&E has been in use relative to its estimated useful life. Alternatively, the PP&E may be recorded at its estimated net remaining cost [SEE NOTE 45] and depreciation/amortization charged over the remaining life based on that net remaining cost.

42 For general PP&E that would be substantially depreciated/amortized had it been recorded upon acquisition based on these standards, materiality and cost-benefit should be weighed heavily in determining estimates. Consideration should be given to:

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

- recording only improvements made during the period beyond the initial expected useful life of general PP&E, and
- making an aggregate entry for whole classes of PP&E (e.g., entire facilities rather than a building by building estimate).

43 In recording existing general PP&E, the difference in amounts added to asset and contra asset accounts shall be credited (or charged) to Net Position of the entity. The amount of the adjustment shall be shown as a "prior period adjustment" in the statement of changes in net position. For published financial statements presenting prior year information, no prior year amounts shall be restated.

44 In the period that these standards are implemented, disclosure of the adjustments, by major class [SEE NOTE 46] of PP&E, made to general PP&E and accumulated depreciation/amortization is required.

Disclosure Requirements

45 The following are minimum general PP&E disclosure requirements:

- the cost, associated accumulated depreciation, and book value by major class;
- the estimated useful lives for each major class;
- the method(s) of depreciation for each major class;
- capitalization threshold(s) including any changes in threshold(s) during the period; and
- restrictions on the use or convertability of general PP&E.

FEDERAL MISSION PROPERTY,

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

PLANT, AND EQUIPMENT

46 Federal mission PP&E includes certain items used to meet a Federal Government mission in which the specific PP&E used is an integral part of the output of the mission. [SEE NOTE 47] PP&E should be considered Federal mission PP&E if it possesses at least one of each of the two types of characteristics presented below. One type of characteristic relates to the use of Federal mission PP&E and the other relates to its useful life.

47 Characteristics related to the use of the Federal mission PP&E are that it:

- has no expected nongovernmental alternative uses; or
- is held for use in the event of emergency, war or natural disaster; or
- is specifically designed for use in a program for which there is no other program or entity (Federal or non-Federal) using similar PP&E with which to compare costs.

48 Characteristics related to the useful life are that it:

- has an indeterminate or unpredictable useful life [SEE NOTE 48] due to the unusual manner in which it is used, improved, retired, modified, or maintained; or
- is at a very high risk of being destroyed during use or premature obsolescence.

WP Federal mission PP&E specifically includes (1) weapons systems PP&E (e.g., fighter/attack aircraft, submarines, and tracked combat vehicles) and (2) space exploration equipment (e.g., space hardware and launch, tracking, and recovery facilities) which will be defined in paragraphs 50 and 52. Federal mission PP&E excludes land.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

50 "Weapons systems" are a combination of one or more weapons [SEE NOTE 49] with all related equipment, materials, services, personnel and means of delivery and deployment required for self-sufficiency. [SEE NOTE 50] This standard addresses only the PP&E component of weapons systems. PP&E included in weapons systems are distinguished from general property, plant, and equipment held by defense agencies and defense support agencies in that they are intended to be used directly by the armed forces to carry out combat missions, when necessary, and to train in peacetime.

51 Weapons systems include only those assets owned by defense agencies and defense-support agencies that would otherwise meet the PP&E definition. Items meeting other than the PP&E asset category definitions (such as items of inventory or operating materials and supplies) are excluded from Federal mission PP&E.

52 "Space exploration equipment" includes items that are:

- intended to operate above the atmosphere for space exploration purposes, and
- any specially designed equipment to aid, service, or operate other equipment engaged in the exploration of space.

Recognition and Measurement

53 The periodic cost of acquiring, constructing, improving, reconstructing, or renovating Federal mission PP&E shall be recognized as a cost on the statement of net cost when incurred. The cost shall be disclosed [SEE NOTE 51] as "cost of Federal mission PP&E." The cost shall include all costs incurred to bring the PP&E to its current condition and location (See paragraph

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

26 for examples of the costs to be considered).

54 Additional reporting requirements for stewardship reporting will be developed in a separate standard.

Implementation Guidance

55 Federal mission PP&E previously recognized as assets and contra-assets for balance sheet reporting shall be removed. The amounts removed shall be charged to Net Position of the entity. The amount of the adjustment shall be shown as a "prior period adjustment" in the statement of changes in net position. The amounts removed from the balance sheet shall be disclosed in a footnote.

56 For published financial statements presenting prior year information, no prior year amounts shall be restated.

HERITAGE ASSETS

57 Heritage assets are property, plant, and equipment that are unique for one or more of the following reasons:

- historical or natural significance;
- cultural, educational or artistic (e.g., aesthetic) importance; or
- significant architectural characteristics.

58 Heritage assets are generally expected to be preserved indefinitely. One example of evidence that a particular asset is heritage in nature is that it is listed on the National Register of Historic Places.

59 Heritage assets may in some cases be used in general government operations (e.g., office buildings such as the main Treasury building). These assets are referred to as

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

multi-use heritage assets. The costs to maintain these assets serve two purposes--they preserve the heritage features and permit continued use of the asset for government operations. Costs of renovation, improvement, restoration, or reconstruction that can be directly related to government operations (e.g., modification or improvement of office space, upgrading of electrical or communications equipment/wiring) shall be treated as general PP&E and depreciated over the period of time they are expected to provide service or produce benefits.

60 Cost to renovate, restore, or reconstruct the heritage asset itself shall be excluded from general PP&E (i.e., not capitalized).

Recognition and Measurement

61 The cost of improving, reconstructing, or renovating heritage assets (excluding any costs designated as general PP&E) shall be recognized as a cost in the period incurred. Also, in the event that heritage assets are acquired or constructed, the cost shall be recognized as a cost of the period incurred. These costs shall be disclosed [SEE NOTE 52] as "Cost of Heritage Assets." The cost shall include all costs incurred to bring the PP&E to its current condition and location (See paragraph 26 for examples of the costs to be considered).

- The cost of heritage assets transferred from other Federal entities shall be the book value of the asset recorded on the transferring entity's books. If the receiving entity does not know the book value, the fair value shall be disclosed in notes to the statement of net cost. If fair value is not estimable, information related to the type and quantity of assets transferred shall be disclosed.
- No amounts for heritage assets acquired

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

through donation, or devise [SEE NOTE 53] shall be recognized in the cost of heritage assets. [SEE NOTE 54] The assets' fair value, if known and material, shall be disclosed in notes to the statement of net cost in the year received. If fair value is not known or reasonably estimable, information related to the type and quantity of assets received shall be disclosed.

62 Additional reporting requirements will be developed for stewardship report items in a separate standard.

Implementation Guidance

63 Heritage assets previously recognized as assets for balance sheet reporting shall be removed. The amounts removed shall be charged to Net Position of the entity. The amount of the adjustment shall be shown as a "prior period adjustment" in the statement of changes in net position. The amounts removed from the balance sheet shall be disclosed in a footnote.

64 If records are not available to determine which costs are associated with heritage assets and which are general PP&E, the entity may estimate the cost of heritage assets by classes of PP&E (e.g., entire facilities rather than a building by building estimate).

65 For published financial statements presenting prior year information, no prior year amounts shall be restated.

STEWARDSHIP LAND

66 Land is defined as the solid part of the surface of the earth.

67 Excluded from the definition of land are

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

materials beneath the surface (i.e., depletable resources such as mineral deposits and petroleum), the space above the surface (i.e., renewable resources such as timber), and the outer-continental shelf resources. The materials excluded from the definition of land will be addressed in a separate accounting and reporting standard related to them.

68 Land and land rights owned by the Federal Government and not acquired for or in connection with other general PP&E [SEE NOTE 55] will be referred to as stewardship land and will not be reported on the balance sheet. Examples of land not associated with other items of general PP&E include land used as forests and parks and land used for wildlife and grazing. General PP&E may be built on existing Federal lands. In this case, the cost of the land would often not be identifiable. In these instances, general PP&E shall include only land or land rights with an identifiable cost that was specifically acquired for or in connection with construction of general PP&E.

Recognition and Measurement

69 The acquisition cost of stewardship land shall be recognized as a cost in the period incurred. The cost shall be disclosed [SEE NOTE 56] as "cost of stewardship land." The cost shall include all costs incurred to bring the PP&E to its current condition and location (See paragraph 26 for examples of the costs to be considered).

70 In some cases, land may be acquired along with existing structures. The following treatments may apply:

- if the structure is significant in and of itself, the entity shall use its judgment as to whether the acquisition cost shall

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

be treated as the cost of stewardship land, heritage asset, or both;

- if the structure is to be used in operations (e.g., as general PP&E) but (1) the value of the structure is insignificant as compared to the value of the land, (2) it has little or no inherent value, and/or (3) it is merely a byproduct of the acquisition of the land, the cost shall be treated as an acquisition of stewardship land in its entirety; or
- only significant structures which have a significant operating use (e.g., a recently constructed hotel or employee housing block) shall be treated as general PP&E by identifying the cost attributable general PP&E and segregating it from the cost of the stewardship land acquired.

71 However, no amounts for stewardship land acquired through donation or devise [SEE NOTE 57] shall be recognized as a cost on the statement of net cost. Its fair value, if known and material, shall be disclosed in notes to the statement of net cost. If fair value is not estimable, information related to the type and quantity of assets received shall be disclosed in the year received.

72 Land may be transferred between Federal entities. In some cases, land included in general PP&E may be transferred to an entity for use as stewardship land. In this instance, the cost of stewardship land transferred from another Federal entity shall be the book value of the land recorded on the transferring entity's books. If the receiving entity does not know the book value, the transfer shall be disclosed in notes if material. In other cases, stewardship land may be transferred between Federal entities. Transfers of stewardship land shall be disclosed in the notes if material.

73 Any costs to prepare stewardship land for its intended use (e. g., razing a building)

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

shall be expensed as a part of the cost of stewardship land.

74 Additional reporting requirements will be developed for stewardship report items in a separate standard.

Implementation Guidance

75 Land previously recognized as assets for balance sheet reporting shall be removed. The amounts removed shall be charged to Net Position of the entity. The amount of the adjustment shall be shown as a "prior period adjustment" in the statement of changes in net position. The amounts removed from the balance sheet shall be disclosed in a footnote.

76 For published financial statements presenting prior year information, no prior year amounts shall be restated.

The provisions of this statement need not be applied to immaterial items.**********
*

CHAPTER 3 -- ACCOUNTING STANDARDS: DEFERRED MAINTENANCE

DEFINITION

77 "Deferred maintenance" is maintenance that was not performed when it should have been or was scheduled to be and which, therefore, is put off or delayed for a future period.

78 For purposes of this standard, maintenance is described as the act of keeping fixed assets in acceptable condition. It includes preventive maintenance, normal repairs, replacement of parts and structural components, and other activities needed to preserve the asset so that it continues to provide acceptable services and achieves its

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

expected life. [SEE NOTE 58] Maintenance excludes activities aimed at expanding the capacity of an asset or otherwise upgrading it to serve needs different from, or significantly greater than, those originally intended.

RECOGNITION

79 A line item for "deferred maintenance amounts" [SEE NOTE 59] shall be presented on the statement of net cost with a note reference in lieu of a dollar amount. [SEE NOTE 60] No amounts shall be recognized for deferred maintenance.

DISCLOSURE REQUIREMENTS

MEASUREMENT

80 Amounts disclosed for deferred maintenance may be measured using:

- condition assessment surveys, or
- life-cycle cost forecasts. [SEE NOTE 61]

81 Condition assessment surveys are periodic inspections of PP&E to determine their current condition and estimated cost to correct any deficiencies. It is desirable that condition assessment surveys be based on generally accepted methods and standards consistently applied. [SEE NOTE 62]

82 Life-cycle costing is an acquisition or procurement technique which considers operating, maintenance, and other costs in addition to the acquisition cost of assets. Since it results in a forecast of maintenance expense, these forecasts may serve as a basis against which to compare actual maintenance expense and estimate deferred maintenance.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

DISCLOSURES

83 At a minimum, the following information shall be presented for all PP&E (each of the four categories established in the PP&E standard should be included).

- Identification of each major class [SEE NOTE 63] of asset for which maintenance has been deferred.

- Method of measuring deferred maintenance for each major class of PP&E.

- If the condition assessment survey method of measuring deferred maintenance is used, the following should be presented for each major class of PP&E:
  * description of requirements or standards for acceptable operating condition,
  * any changes in the condition requirements or standards, and
  * asset condition [SEE NOTE 64] and a range estimate of the dollar amount of maintenance needed to return it to its acceptable operating condition.

- If the total life-cycle cost method is used the following should be presented for each major class of PP&E:
  * the original date of the maintenance forecast and an explanation for any changes to the forecast,
  * prior year balance of the cumulative deferred maintenance amount,
  * the dollar amount of maintenance that was defined by the professionals who designed, built or manage the PP&E as required maintenance for the reporting period,
  * the dollar amount of maintenance actually performed during the period,
  * the difference between the forecast and actual maintenance,
  * any adjustments to the scheduled

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

amounts deemed necessary by the managers of the PP&E, [SEE NOTE 65] and

* the ending cumulative balance for the reporting period for each major class of asset experiencing deferred maintenance.

OPTIONAL DISCLOSURES

84 Stratification between critical and noncritical amounts of maintenance needed to return each major class of asset to its acceptable operating condition. If management elects to disclose critical and noncritical amounts, the disclosure shall include management's definition of these categories.

The provisions of this statement need not be applied to immaterial items.

****

CHAPTER 4 -- ACCOUNTING STANDARDS: CLEANUP COSTS

DEFINITION

85 Cleanup costs are the costs of removing, containing, and/or disposing of (1) hazardous waste (See paragraph 86) from property, or (2) material and/or property that consists of hazardous waste at permanent or temporary closure or shutdown of associated PP&E.

86 Hazardous waste is a solid, liquid, or gaseous waste, or combination of these wastes, which because of its quantity, concentration, or physical, chemical, or infectious characteristics may cause or significantly contribute to an increase in mortality or an increase in serious irreversible, or incapacitating reversible,

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

illness or pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported, disposed of, or otherwise managed.

87 Cleanup may include, but is not limited to, decontamination, decommissioning, site restoration, site monitoring, closure, and postclosure costs.

SCOPE

88 This standard applies only to cleanup costs from Federal operations known to result in hazardous waste which the Federal Government is required by Federal, state and/or local statutes and/or regulations that have been approved as of the balance sheet date, regardless of the effective date, to cleanup (i.e., remove, contain or dispose of). [SEE NOTE 66] These cleanup costs meet the definition of liability provided in Statement of Recommended Accounting Standards no. 5, Accounting for Liabilities of the Federal Government (SRAS no. 5).

89 However, due to the nature of the liability and the timing associated with cleanup costs, additional guidance is provided in this standard on the recognition of cleanup costs over the life of the related PP&E. Guidance is required since cleanup can not occur until the end of the useful life of the PP&E or at regular intervals during that life.

90 This standard is intended to supplement the accounting requirements for liabilities in SRAS no. 5. SRAS no. 5 defines liabilities as a "probable future outflow or other sacrifice of resources as a result of past transactions or events." Further, SRAS no. 5 requires recognition of liabilities that are probable and measurable. Measurable means that an item has a relevant attribute that can be

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

quantified in monetary units with sufficient reliability to be reasonably estimable.

91 The recognition and measurement standards provided in this standard are subject to the criteria for recognition of liabilities included in SRAS no. 5. That is, liabilities shall be recognized when three conditions are met:

- a past transaction or event has occurred,
- a future outflow or other sacrifice of resources is probable, [SEE NOTE 67] and
- the future outflow or sacrifice of resources is measurable. [SEE NOTE 68]

92 SRAS no. 5 also provides for disclosure of liabilities that do not meet all of the above criteria; these standards apply to cleanup costs as well.

93 Other cleanup costs, such as those resulting from accidents or where cleanup is an ongoing part of operations, are to be accounted for in accordance with liability standards and are not subject to the recognition guidance provided in this standard. This guidance does not apply to these other types of cleanup since the cleanup effort is not deferred until operation of associated PP&E ceases either permanently or temporarily. [SEE NOTE 69]

RECOGNITION AND MEASUREMENT

ESTIMATION METHODS

94 Cleanup costs, as defined above, shall be estimated when the associated PP&E is placed in service . The estimate shall be referred to as the "estimated total cleanup cost." There are two approaches to recognizing this total--one applies to general PP&E and another to stewardship PP&E.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

95 The estimate shall contemplate:

- the cleanup plan, including
  * level of restoration to be performed,
  * current legal or regulatory requirements, [SEE NOTE 70] and
  * current technology; and

- current cost which is the amount that would be paid if all equipment, facilities, and services included in the estimate were acquired during the current period.

96 Estimates shall be revised periodically to account for material changes due to inflation or deflation and changes in regulations, plans and/or technology. New cost estimates should be provided if there is evidence that material changes have occurred; otherwise estimates may be revised through indexing.

CLEANUP COST FOR GENERAL PP&E

97 A portion of estimated total cleanup costs shall be recognized as expense during each period that general PP&E is in operation. This shall be accomplished in a systematic and rational manner based on use of the physical capacity of the associated PP&E (e.g., expected usable landfill area) whenever possible. If physical capacity is not applicable or estimable, the estimated useful life of the associated PP&E may serve as the basis for systematic and rational recognition of expense and accumulation of the liability.

98 Recognition of the expense and accumulation of the liability shall begin on the date that the PP&E is placed into service, continue in each period that operation continues, and be completed when the PP&E ceases operation.

99 As reestimates (See paragraph 96) are made,

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

the cumulative effect of changes in total estimated cleanup costs related to current and past operations shall be recognized as expense and the liability adjusted in the period of the change in estimate.

100 As cleanup costs are paid, payments shall be recognized as a reduction in the liability for cleanup costs. These include the cost of PP&E or other assets acquired for use in cleanup activities.

CLEANUP COST FOR STEWARDSHIP PP&E

101 Consistent with the treatment of the acquisition cost of stewardship PP&E (i.e., expensing in the period placed in service), the total estimated cleanup cost shall be recognized as expense in the period that the stewardship asset is placed in service and a liability established.

102 The liability shall be adjusted when the estimated total cleanup costs are reestimated as described in paragraph 96. Adjustments to the liability shall be recognized in expense as "changes in estimated cleanup costs from prior periods."

103 As cleanup costs are paid, payments shall be recognized as a reduction in the liability for cleanup costs. These include the cost of PP&E or other assets acquired for use in cleanup activities.

IMPLEMENTATION GUIDANCE

104 Two implementation approaches have been provided for liabilities related to general PP&E in service at the effective date of this standard:

- A liability shall be recognized for the portion of the estimated total cleanup

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

cost that is attributable to that portion of the physical capacity used or that portion of the estimated useful life that has passed since the PP&E was placed in service. The remaining cost shall be allocated as provided in paragraphs 97 through 99.

- If costs are not intended to be recovered primarily through user charges, management may elect to recognize the estimated total cleanup cost as a liability upon implementation. In addition, in periods following the implementation period, any changes in the estimated total cleanup cost shall be expensed when reestimates occur and the liability balance adjusted. The provisions for cost allocation provided in paragraphs 97 through 99 shall not apply under this implementation method.

105 The offsetting charge for any liability recognized upon implementation shall be made to Net Position of the entity. The amount of the adjustment shall be shown as a "prior period adjustment" in any statement of changes in net position that may be required. No amounts shall be recognized as expense in the period of implementation. The amounts involved shall be disclosed and to the extent possible the amount associated with current and prior periods should be noted.

106 For stewardship PP&E that are in service at the effective date of this standard, the liability for cleanup costs shall be recognized and an adjustment made to the Net Position of the entity.The amount of the adjustment shall be shown as a "prior period adjustment" in any statement of changes in net position that may be required. The amounts involved shall be disclosed.

DISCLOSURE REQUIREMENTS

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

107 The sources (applicable laws and regulations) of cleanup requirements.

108 The method for assigning estimated total cleanup costs to current operating periods (e.g., physical capacity versus passage of time).

109 For cleanup cost associated with general PP&E, the unrecognized portion of estimated total cleanup costs (e.g., the estimated total cleanup costs less the cumulative amounts charged to expense at the balance sheet date).

110 Material changes in total estimated cleanup costs due to changes in laws, technology, or plans shall be disclosed. In addition, the portion of the change in estimate that relates to prior period operations shall be disclosed.

111 The nature of estimates and the disclosure of information regarding possible changes due to inflation, deflation, technology, or applicable laws and regulations.

The provisions of this statement need not be applied to immaterial items.

****

APPENDIX A -- BASIS FOR THE BOARD'S CONCLUSIONS

112 This appendix summarizes significant considerations by the Board in reaching the conclusions in this statement. In the following paragraphs, the Board's considerations in developing these standards as well as positions on specific issues raised in alternative views, comment letters, and during public hearings are explained. The Board relied extensively on input from a task

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

force on Capital Expenditures as well as a small working subgroup on Physical Property. These paragraphs include reasons for accepting certain approaches and rejecting others. Individual members gave greater weight to some factors than to others.

113 This appendix addresses each of the three standards in sequence.

PROPERTY, PLANT, AND EQUIPMENT

BACKGROUND

114 Before addressing specific issues resolved following issuance of the exposure draft, this section provides a broad basis for the main provisions of the standard on investments in PP&E. The Federal Government makes many expenditures that can be characterized as investments or investment-type expenditures. These include expenditures for Federally owned PP&E.

115 Accounting for expenditures for PP&E as well as for the existing stock of PP&E is a significant undertaking because the Federal Government owns substantial amounts of diverse PP&E. Federal PP&E includes approximately 650 million acres of land, buildings containing over 1.5 billion square feet of floor space, many different forms of equipment, and military hardware.

116 These are used for a wide range of purposes; including, among others, operating, defense, conservation, and heritage purposes. Some of these purposes relate to the Federal Government's responsibility to provide for the Nation's common defense and general welfare. Specific types of PP&E are used by the Federal Government to meet this responsibility. Other types of PP&E are held and used for operating purposes that are not

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

unlike those of non-federal entities.

117 Some Federal operations are similar to profit-seeking enterprises and can be described as business-type activities. However, these business-type activities account for a small portion of the investment in PP&E. The majority of the investment in PP&E is used to provide government services and goods where user charges are not the primary source of revenues.

118 The Board found that a single accounting method for such diverse Federal PP&E would not meet the objectives established in its Objectives of Federal Financial Reporting.Therefore, the Board identified categories of PP&E and set different accounting methods for each category.

Categories Required

119 The PP&E standards incorporate the following categories:

- general PP&E are PP&E used to provide general government services;
- Federal mission PP&E are PP&E that are an integral part of the output of certain unique Federal Government missions;
- heritage assets are those assets possessing significant educational, cultural, or natural characteristics; and
- stewardship land [SEE NOTE 71] is land other than that included in general PP&E.

120 The latter three categories of assets are referred to as stewardship PP&E. The term "stewardship PP&E" is used simply to refer to those categories of PP&E to be reported on a stewardship report.

General PP&E

121 General PP&E are items used to provide

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

general government services; including PP&E that:

- could be used for alternative purposes (e.g., by other Federal programs, state or local governments, or non-governmental entities) but is used to produce goods or services, or to support the mission of the entity, or
- is used in business-type activities, or
- is used by entities whose costs can be compared to other entities (e.g., Federal hospital services in comparison to other hospitals).

122 Allocation of the cost of general PP&E, excluding land, among accounting periods is essential to assessing operating performance. The Board's concepts statement, Objectives of Federal Financial Reporting, focuses on relating cost to accomplishments in reporting an entity's operating performance. Cost information is of fundamental importance both to program managers in operating their activities efficiently and effectively and to executive and congressional decision makers in deciding on resource allocation. General PP&E will be capitalized and depreciated to provide this information.

Stewardship PP&E

123 For stewardship PP&E, [SEE NOTE 72] the predominant reporting objective is stewardship. This is in contrast to general PP&E, for which the Board is concerned with providing information to assess operating performance and, therefore, provided for depreciation accounting. The most relevant information is about the existence of stewardship PP&E and that information can be provided through a new type of reporting--supplementary stewardship reporting.

124 For stewardship PP&E, the Board believes that allocation of historical cost to

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

operating expense for each period would not contribute to the measurement of entity operating performance. Prior to issuing its Objectives statement, the Board conducted a user needs study and met with representatives of a wide variety of user groups. Most users specifically indicated that depreciating stewardship PP&E such as weapons systems would not provide meaningful information for assessing the entity's operating performance. The Board believes that its standards should address the needs of users and the Board has found that users do not need information which includes depreciation expense on this category of PP&E.

125 The Board noted in its Objectives statement that the government's responsibility for the nation's common defense and general welfare is unique and that, in some cases, the most relevant measures of performance are nonfinancial. [SEE NOTE 73] Despite the preference for nonfinancial performance measures for stewardship PP&E, the government must demonstrate that it is being an appropriate "steward" for these assets. To meet the stewardship objective, the government must be able to answer basic questions such as:

- What and where are the important assets?
- Is the government effectively managing and safeguarding its assets?

126 Answers to these questions can be provided through supplementary stewardship reporting. The stewardship information provided would not necessarily have the same measurement basis as information shown on the balance sheet. Information could include value, quantity, and capacity depending on the category being reported on. These types of information are not typically found in balance sheet reporting. (Also, see discussion of deferred maintenance starting at paragraph 171, 181 regarding other

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

information that users consider relevant.)

127 The Board is addressing supplementary stewardship reporting in another standard. The information to be provided for stewardship PP&E is proposed in detail in that standard. Each of the stewardship PP&E categories are discussed further in the following paragraphs.

Federal Mission PP&E

128 Federal mission PP&E are specific PP&E acquired to provide a unique good or service for which there is not necessarily a periodic output against which to match costs. For example, the existence of and readiness of weapons systems supports national defense regardless of their actual combat use on a period by period basis. Also, space exploration equipment is used in long-term research efforts which may or may not produce an output each period but which nevertheless benefits the nation in the long run.

129 The standard specifically identifies weapons systems and space exploration equipment as Federal mission PP&E as well as providing a list of characteristics of Federal mission PP&E. The Board articulated characteristics of Federal mission PP&E because it recognizes that there are other types of PP&E, or PP&E may be developed in the future, that are similar to these two items. To be categorized as Federal mission PP&E an item shall meet at least one characteristic from each of the following two types of characteristics.

130 Characteristics related to the use of Federal mission PP&E are that it:

- has no expected nongovernmental alternative uses; or
- is held for use in the event of emergency, war or natural disaster; or

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

- is specifically designed for use in a program for which there is no other program or entity (Federal or non-Federal) using similar PP&E with which to compare costs.

131 Characteristics related to the useful life are that it:

- has an indeterminate or unpredictable useful life [SEE NOTE 74] due to the manner in which it is used, improved, retired, modified, or maintained; or
- is at a very high risk of being destroyed during use or of premature obsolescence.

132 The cost of Federal mission PP&E acquired during the period be shown on the operating statement.

Heritage assets

133 Heritage assets are held for their cultural, architectural, or aesthetic characteristics. Users have identified nonfinancial information as being relevant for these assets. For assessing operating performance, the Board believes that relevant cost information is provided through reporting of periodic maintenance cost since heritage assets are intended to be preserved as national treasures. It is anticipated that they will be maintained in reasonable repair and that there will be no diminution in their usefulness over time.

134 In addition to assets held purely for heritage purposes (e.g., the Washington Monument), the Federal Government uses heritage assets in its day-to-day operations. For example, many Federal office buildings, such as the Old Executive Office Building, have monumental characteristics. The Board considered whether these multi-use heritage assets would be more appropriately categorized as general PP&E.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

135 Despite their heritage characteristics, these assets serve a function that could otherwise be served by assets that do not possess heritage characteristics. Therefore, the standards provide that costs of reconstruction, renovation, or improvements that are directly associated with supporting operations be treated in a manner consistent with general PP&E. The Board based this decision on the need to measure cost for operations and to compare cost between entities.

Stewardship Land

136 The Federal Government owns vast amounts of land and its use of land is diverse. In some instances Federal land is integral to the ownership of general PP&E. For example, the cost of land upon which an office building is sited is integral to the cost of that building. Land acquired for or in connection with general PP&E will be recognized on the balance sheet to provide a more comprehensive measure of the assets devoted to general government operations. However, since land is not a depreciating asset, depreciation expense will not be recognized on land included in general PP&E.

137 Most Federal land is not directly related to general PP&E. For example, the national parks and forests are not used to support general PP&E. The Board concluded that land other than that acquired for or in connection with other general PP&E should not be reported on the balance sheet. This is consistent with the Board's treatment of heritage assets in that much of the government's land is held for the general welfare of the nation and is intended to be preserved and protected.

ISSUES

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

138 Following issuance of the ED, the Board specifically considered several issues related to the PP&E standard. These issues are addressed in the sequence that they appear in the standard.

Definitions

139 The Board asked respondents to comment on the appropriateness of the definitions of PP&E, general PP&E, Federal mission PP&E, heritage assets, and stewardship land. Respondents raised issues on the overall definition of PP&E including (1) internally-developed software, (2) land rights, (3) capitalization threshold, and (4) reversionary interests in property. These four issues are discussed below. An issue raised regarding the Federal mission PP&E definition is also addressed below.

Internally-developed Software

140 The ED proposed that internally-developed software be excluded from PP&E -- in effect, that it be expensed when incurred. In making this proposal, the Board pointed to concerns affecting the objectivity/accuracy of any capitalized cost for internally-developed software in general PP&E. [SEE NOTE 75] The Board was concerned that costs could be overcapitalized thus understating expense for the period and that it would be difficult to provide for the removal or write-off of costs related to unsuccessful projects and/or cost overruns. Given these practical concerns and the expectation that costs for software development efforts would not fluctuate dramatically since they related to continuous agency efforts, the Board proposed that these costs be expensed. [SEE NOTE 76]

141 Many respondents supported the Board's view. They noted that, among other problems,

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

it would be difficult to distinguish new development efforts from ongoing system maintenance. In fact, some respondents commented that software undergoes continuous improvement and updating.

142 On the other hand, the majority of respondents objected to the exclusion of these costs from PP&E. Many argued that internally-developed software met the overall definition of PP&E and that accounting could accommodate the problems of cost overruns and unsuccessful efforts. Many suggested that costs be held in a work-in-process account and any unsuccessful efforts subsequently written off in the period deemed unsuccessful. In addition, many believed that cost overruns were appropriate to include in the cost of the asset.

143 Ultimately, the Board made two changes to the PP&E definitions -- they removed the statement excluding internally-developed software from PP&E and they added a provision for recognition of internally-developed software as a component of general PP&E under certain circumstances. Since the Board's concern was with the potential for overcapitalization of these costs, they found that it was not necessary to exclude the costs from the PP&E categories for which costs would not be capitalized. Therefore, any internally-developed software costs appropriately classified as an item of stewardship PP&E may be included in those categories.

144 For internally-developed software costs that would be categorized as general PP&E, the Board placed several restrictions on the capitalization of costs. To be capitalized, it must be intended that the costs be recovered through charges to users. In addition, only certain costs may be capitalized after it has been established that the software project is likely to be

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

successful. Once capitalized, the costs can not be amortized over a period longer than five years.

145 In addition to internally-developed software, the Board discussed accounting for contractor-developed software. In principle, the Board's consensus was that the same accounting should be provided for contractor-developed software as for internally-developed software. However, the Board believed that this proposal should be exposed for comment prior to establishing a standard to that effect. Therefore, the standards do not provide specific provisions restricting the capitalization of contractor-developed software.

Land Rights

146 The Board received a request to address restrictive easements acquired by a Federal agency. This agency acquires restrictive easements limiting the use of land adjoining the agency's own property. The Board considers these easements a "land right." Land rights are interests and privileges held by an entity in land owned by others.

147 The Board provided for the recognition of land rights as part of PP&E since they are generally associated with other items of PP&E actually owned by the entity. In addition, where land rights are for a limited period of time and are includable in the general PP&E category, the Board provided for depreciation of the cost.

Capitalization Threshold

148 Many respondents requested that the Board provide a capitalization threshold as an element of the PP&E definition. The Board addressed this issue in developing the ED. At that time, the Board carefully considered whether to take a prescriptive approach by

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

setting a threshold or to permit entities the latitude to establish a threshold suited to their particular operating environment. The Board believes that Federal entities are sufficiently diverse that one threshold would not be suitable for all entities. For example, Title 2's $5,000 threshold would be immaterial for defense department operations but perhaps not for a smaller entity such as the Small Business Administration.

149 Instead of setting a specific threshold, the Board has adopted a materiality approach--just as is done in private sector accounting. Each entity would establish its own threshold as well as guidance on applying the threshold to bulk purchases. The Board believes that permitting management discretion in establishing capitalization policies will lead to a more cost-effective application of the accounting standards.

Reversionary Interests in PP&E

150 The Board also received a request to address reversionary interests in PP&E. In some instances, the Federal Government provides grants to state and local governments for the acquisition of PP&E. If the state or local government eventually decides that it no longer needs to use the PP&E for the purpose specified in the original grant there is often a provision that the PP&E must revert to Federal ownership. In these cases, the Federal Government maintains a reversionary interest in PP&E. In essence, these are contingent assets and should not be recognized on the balance sheet. The Board elected to specifically exclude these items from PP&E.

Federal Mission PP&E

151 Some respondents indicated that the term "Federal mission PP&E" had broader

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

implications than intended by its definition. It was suggested that some may assume any PP&E used to meet an agency's mission would fit this category (e.g., essentially all Federally owned PP&E).

152 The Board agreed that it was possible that a mere reading of the term "Federal mission PP&E" could lead to broader application of the category than permitted under the standard. However, the Board found that there was no brief term that would effectively communicate the nature of the PP&E properly includable in this category. The Board believes that the characteristics provided as well as the illustrations included in Appendix B of this document will clearly establish the appropriate use of this category. In addition, the Board has incorporated in the standard a cautionary footnote regarding loose interpretations drawn from the term "Federal mission PP&E."

Depreciation

153 The exposure draft posed several questions related to depreciation accounting for general PP&E. Briefly, the questions addressed:

usefulness of depreciation expense for the assessment of operating performance,
an alternative view suggesting that depreciation accounting be limited to business-type activities,
usefulness of the allocation of depreciation expense to responsibility segments, and
cost/benefit of allocating depreciation expense to programs

154 Overall, the respondents supported the Board's proposal to require depreciation accounting on all general PP&E. Many indicated that depreciation accounting would

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

improve performance measurement by producing comprehensive, comparable cost information. In addition, operating expenses would not be overstated in periods that assets were purchased and understated in other periods.

155 A few respondents supported the alternative view that would limit depreciation accounting to business-type activities. They argued that depreciation was only necessary where expenses were to be matched to revenues. This view is contrary to the operating performance objective and would not support development of cost information to associate with performance measures.

156 The Board did not make any changes to its requirements to apply depreciation accounting to general PP&E.

Multi-use Heritage Assets

157 The ED addressed renovation, reconstruction, improvement, and rebuilding costs for multi-use heritage assets (e.g., monumental style office buildings). Under the ED's proposal, any costs not directly associated with the heritage nature of the asset would be capitalized and depreciated as general PP&E. The ED also provided that abnormally high costs due to the heritage features of the assets (e.g., replacement of a specialized roofing material versus a modern day equivalent) be treated as heritage asset costs.

158 Respondents indicated that it would be very difficult to apply the proposed standards. Difficulties would include segregating the cost associated with preserving the heritage assets and supporting operations as well as identifying abnormal costs. In response to these concerns, the Board modified the treatment of multi-use heritage assets. The standard now provides that only renovation,

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

reconstruction, and improvement costs directly attributable to operations be capitalized as general PP&E.

Current Value

159 The ED included an alternative view espousing the use of current value accounting for Federal Government PP&E. This view was not supported by the respondents. The majority of respondents believed that current values would be difficult and costly to obtain, and subject to manipulation. Many indicated that current values were often useful to decision makers and should be provided on an as needed basis rather than incorporated in the basic financial statements.

Federal Mission PP&E

160 Overall, the reaction to the Federal mission PP&E category was favorable. Respondents indicated that they would not have difficulty applying the category descriptions. However, the Board received the following specific requests for major revisions in the Federal mission PP&E category:

- to retain the definition but include Federal mission PP&E on the balance sheet and apply depreciation accounting to these assets, and
- to make use of the category optional (e.g., managers would be free to use the general PP&E category for PP&E that would otherwise qualify as Federal mission PP&E).

Depreciate Federal Mission PP&E

161 The Board did not adopt the first proposal--to apply depreciation accounting to Federal mission PP&E. While there may be management

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

uses of this information, no persuasive examples of management uses have been identified. The Board remains convinced that depreciation accounting for these unusual items of PP&E would not provide meaningful information--a view that is supported by the Board's 1992 user needs study. Further, the Board wishes to note that nothing precludes management from developing depreciation information through cost finding means if it desires to do so for particular management purposes.

Make the Federal Mission PP&E Category Permissive

162 It was proposed that classification of PP&E as Federal mission be permissive rather than mandatory. Two reasons were given for this proposal:

- some PP&E is used as both Federal mission and general PP&E (for example, office facilities located at nuclear weapons production plants), and
- entity management should be free to decide that depreciation information on Federal mission PP&E is useful.

163 It was suggested that adopting this proposal would allow agencies to classify property as best suits their needs. The Board discussed this proposal at length. Some Board members were favorably inclined to permit entity managers to exercise judgment regarding the accounting treatment of Federal mission PP&E. However, the majority of the Board members believed that making the category optional would be inappropriate.

164 These members argued that (1) the user needs study supported their belief that historical cost depreciation on these types of items was not useful, (2) it would not be appropriate to give entities the latitude to use different accounting methods for similar

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

assets, and (3) it would not be cost-beneficial to permit entities to make item by item judgments on appropriate accounting treatment. The members noted that, in connection with the proposal to require depreciation accounting for Federal mission PP&E (See paragraph 161), they had not been able to identify any management uses of depreciation information on Federal mission PP&E. The Board was concerned that entities may make unsupported, and costly, decisions regarding the election to categorize items as general or Federal mission PP&E. While entities can use cost finding to determine depreciation expense for internal purposes if they so desire, the Board does not believe that depreciation of Federal mission PP&E would be useful for general purpose financial reports.

165 The Board decided that use of the Federal mission PP&E category would remain mandatory for PP&E exhibiting the designated characteristics. The Board did add guidance in the standard regarding the selection of the base unit to be used in categorizing PP&E (See paragraph 22). One respondent had proposed that this guidance be added and stated that it would aid entities in establishing the level of detail necessary to properly categorize PP&E. For example, should PP&E be categorized on a site by site basis or by a smaller unit such as building by building. As with the capitalization threshold, the Board has indicated the factors that should enter into the selection of a base unit but has ultimately left the actual selection up to management.

Other PP&E Meeting the Characteristics

166 The Board posed a question in the ED regarding the classification of nuclear weapons production facilities and military base facilities as Federal mission PP&E. [SEE

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

NOTE 77] This question was posed because of a discussion among the Board members as to whether these items would or would not meet the Federal mission PP&E definition.

167 The majority of the respondents indicated that nuclear weapons production facilities meet the current characteristics of Federal mission PP&E--confirming the initial reaction of the Board members. One respondent did indicate that these facilities could be converted to other uses--as had munitions plants following World War II--however, the Board believes that the cost of such a conversion would be so great as to make it improbable in the near term. The Board has not elected to add this as another specifically identified item that qualifies as Federal mission PP&E because it is a good illustration of the purpose and application of the characteristics developed. In addition, the Board prefers not to engage in an exercise of listing all items that qualify since the absence of certain items may lead practitioners to assume that an item was specifically excluded.

168 The majority of respondents indicated that military base facilities would not as a group meet the definition of Federal mission PP&E and that the category should not be expanded to accommodate these assets. Many respondents pointed out that military base facilities have alternative uses and are currently being reviewed for just that purpose. The Board agrees with these views and has not modified the definition to permit inclusion of military base facilities in the category.

Audit of Federal Mission PP&E

169 Several respondents expressed concern regarding the level of audit coverage applicable to Federal mission PP&E. Although the ED did not specifically address

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

supplementary stewardship reporting for those categories of PP&E removed from the balance sheet, there was concern that removing these categories would lessen the audit coverage. Respondents noted that military weapons systems and space exploration equipment represented a substantial investment. They were concerned that the changes could lead to poor tracking systems for these items as well as weak internal controls over them. Other respondents pointed out that the key information is the existence and condition of these assets rather than the historical cost of the items. In addition, they suggested that devoting audit resources to verifying historical cost dollar amounts would detract from auditing more important existence and condition information.

170 The Board responded with the following points:

- auditing standards are beyond the scope of the Board's responsibilities,
- Board members representing the General Accounting Office (GAO) and the Office of Management and Budget (OMB) indicated that the audit coverage would be appropriately addressed in their work on Federal audit requirements,
- accounting standards should be established based on information needs not audit concerns, and
- the ED on supplementary stewardship reporting will include a statement to the effect that the Board expects that the responsible parties will produce audit requirements to satisfy concerns of the respondents.

DEFERRED MAINTENANCE

171 The deferred maintenance standard was well received by the majority of respondents. The Board addressed the issue in part due to the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

many state and local governments as well as national groups that concerned over the deteriorating condition of government owned PP&E. A report of the U.S. Advisory Commission on Intergovernmental Relations (ACIR), High Performance Public Works, [SEE NOTE 78] notes that maintenance competes for funding with other government programs and is often underfunded. Contributing to this underfunding is the fact that the consequences of underfunding maintenance are often not immediately reported. The consequences include increased safety hazards, poor service to the public, higher costs in the future, and inefficient operations.

172 The ACIR recommended that entities disclose information on:

- the condition of assets,
- the cost of unfunded maintenance,
- the consequences of unfunded maintenance, and
- the uncertainty in estimates of unfunded maintenance.

173 The Capital Expenditures task force also recognized that deferred maintenance was an issue for Federal PP&E and requested that the Board address it. The policies and initiatives related to deferred maintenance at three Federal agencies [SEE NOTE 79] were reviewed and it was found that Federal agencies are developing systems to report on deferred maintenance. Although the systems are different, the goals of the systems are consistent--to provide reliable information on the condition of PP&E and to estimate the cost of correcting deficiencies.

174 Under these accounting standards, deferred maintenance information will be incorporated in the financial reports despite the differences in measurement among the agencies. The Board believes that deferred

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

maintenance is a cost--a cost that management, at whatever level, has elected not to fund. However, the Board found that deferred maintenance is not sufficiently measurable to be recognized in the accounting systems.

175 However, to highlight the reality that the cost remains despite being unfunded, the standards provide that deferred maintenance be disclosed by placing a line item on the statement of net cost with a note reference in lieu of a dollar amount on the financial statements. This recommendation is consistent with the findings of the Board's user needs study; that information on the cost of deferred maintenance is important to users. In addition, due to the measurement differences between entities, the disclosure requirements are flexible.

176 The standards provide two alternatives for estimating amounts to be disclosed--condition assessment surveys and life cycle cost analyses. Condition assessment surveys would provide disclosure of the estimated cost to return the PP&E to its desired condition. Life cycle cost analyses would highlight differences between planned maintenance and actual maintenance.

177 Both of these methods will be under the control of entity program managers since deferred maintenance is dependent on the purpose for which PP&E is held and on judgment regarding what condition PP&E should be in to meet that purpose. Entities are permitted flexibility in (1) setting standards for maintenance requirements and (2) establishing cost beneficial methods to estimate the cost of deferred maintenance.

178 The proposed standards require disclosure of information on the condition of PP&E, estimates of the cost of deferred maintenance, and methods used to assess

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

deferred maintenance. The standards apply to both PP&E reported on the balance sheet and the stewardship report.

179 In response to the ED, two opposing suggestions were raised--(1) recognize the amounts as a liability, and (2) remove the information from the notes.

RECOGNITION

180 A few respondents, including two appearing at the public hearing, suggested that the Board provide for recognition of the liability associated with deferred maintenance. The Board does not believe that deferred maintenance can or should be recognized as a liability because it is not sufficiently measurable to be recognized. Deferred maintenance reporting is in an evolutionary phase with Federal agencies currently developing a variety of systems to assess deferred maintenance. Measurement can not be described at this time as consistent or comparable. The deferred maintenance standard will remain as drafted. However, if and when government maintenance standards (e.g., minimum acceptable condition and standard repair costs) are set, the Board will revisit the accounting and consider requiring recognition of the liability and the cost.

REMOVE FROM NOTES

181 A few respondents requested that the Board provide for deferred maintenance information through required supplemental information to lessen the audit burden associated with the information. The Board--as was the case with Federal mission PP&E--does not believe that audit coverage should govern the placement of information in the annual reports. Deferred maintenance information is considered important because it ensures that readers are

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

informed of the condition of Federally owned PP&E. If there is a need to reduce the audit coverage, the Board believes that GAO and OMB can best address this need.

CLEANUP COST

182 The Board elected to address cleanup costs from long-term Federal operations as one of the costs associated with PP&E. For example, the Federal Government operates nuclear facilities and is required by law to cleanup any hazardous materials upon closing the facilities. This obligation meets the Board's definition of liability. [SEE NOTE 80] However, because the cleanup of these types of facilities would not occur until operations cease, additional guidance is needed to determine when and how to recognize these costs and liabilities.

183 The guidance in this standard builds on the accounting standards developed for liabilities. These standards were published in the Board's statement entitled Accounting for Liabilities of the Federal Government (liabilities standard). The liabilities standard includes:

- the liability definition,
- recognition criteria, and
- disclosure requirements.

184 The liabilities standard is applicable to cleanup costs. For example, if cleanup costs are not both probable and measurable the disclosure requirements in the liabilities standard would apply. The standards in this statement address cleanup cost accounting including:

- allocating cleanup costs to operating periods,
- estimating cleanup costs to be paid far in the future (e.g., using a current cost

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

approach), and
- recognizing changes in estimates prior to actual cleanup.

185 Because of the differences in accounting for the costs of general PP&E and stewardship PP&E, the Board developed different methods for allocating cleanup costs to operating periods depending on the category of the related PP&E.

CLEANUP OF GENERAL PP&E

186 The Board concluded that the liability for cleanup costs related to the operation of general PP&E would be recognized in a systematic and rational manner over the periods that the associated general PP&E is in use. This approach is consistent with the requirement to depreciate general PP&E. In addition, the Board requires disclosure of the estimate of total cleanup costs.

CLEANUP OF STEWARDSHIP PP&E

187 For cleanup costs related to stewardship PP&E, the Board concluded that the total estimated liability for cleanup cost would be recognized at the time that the stewardship PP&E is placed in service. This is consistent with the treatment of the acquisition cost of the stewardship PP&E which is recognized as a cost of operations in the period that the PP&E is placed in service.

ESTIMATING CLEANUP COSTS

188 With regard to estimating cleanup cost, the Board concluded that the estimate would be based on the current cost to perform the cleanup. Current cost should be based on existing laws, technology and management plans. An alternative to current cost would

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

have been to estimate costs in the future, factoring in expected inflation, and discounting this amount to current dollars. The Board did not believe that this approach offered any greater degree of accuracy in return for the additional effort involved in making the estimate.

189 As with all estimates, the estimates of cleanup costs will change over time. These changes will be due to inflation as well as to changes in laws and technology.

190 For cleanup costs associated with general PP&E, changes in estimates related to current and prior period operations be recognized as an expense in the period of the change. For example, if a facility with a capacity to produce 100 tons of material has produced 60 tons of material, then 60% of the change in estimate should be recognized as expense in the year that the estimate changes.

191 For cleanup costs associated with stewardship PP&E, the total change in estimate be recognized in the period of the change.

CLEANUP COST ISSUES

192 Respondents to the ED were supportive of the Board's efforts to address cleanup costs. However, several suggested that the Board's treatment of the liability associated with general PP&E--recognizing it incrementally over the life of the PP&E--was inconsistent with its definition of a liability. In some cases, respondents argued, the cleanup liability is incurred at the time the PP&E is placed in service. These respondents suggested that the Board provide for full recognition of the liability if an amount is reasonably measurable at that time.

193 The Board did not adopt this suggestion.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

While the Board recognizes that in fact the liability may be incurred at the date that general PP&E is put in service, the actual recognition of the liability is problematic in a double entry accounting system. Generally, the recognition of a liability, a credit account, generates a concurrent recognition of either an expense (e.g., accounts payable for fuel bills is offset by fuel expense) or an asset (e.g., a capital lease liability is offset by an asset--PP&E), both typically debit accounts. In this case, the cleanup cost is not appropriately includable in operating expense of the period that the PP&E is placed in service. This would create a need for a balance sheet debit to offset the liability.

194 The Board does not believe that it would be appropriate to recognize an asset to offset the cleanup liability. Although some argue cleanup cost is a deferred cost of associated PP&E, the Board does not believe that these costs meet the asset definition and finds that recognition of cleanup cost as a component of PP&E would significantly overstate assets.

195 Other respondents expressed the opposite position, suggesting that it is not appropriate to recognize cleanup costs until they are budgeted for. This approach is not only inconsistent with the definition of a liability but would keep users of the financial statements in the dark as to the magnitude of Federal commitments for environmental cleanup.

196 The Board believes that the standards it has developed will contribute to meeting the operating performance and stewardship reporting objectives of Federal financial reporting. The cleanup cost standards have not been modified for either of these recommendations.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

197 One modification that was made relates to implementation of the standard. Implementation is a significant issue given the magnitude of the Government's existing facilities and its obligations for cleanup of those facilities. One Board member requested that the implementation guidance related to cleanup of general PP&E provide an alternative method. It was suggested that provision of a second method would lower the cost of implementing the standard in situations where the related PP&E had been in service for a substantial portion of its estimated useful life.

198 The second method would be to recognize the entire estimated total cleanup cost as a liability upon implementation. In periods following implementation, entities electing this method would recognize any changes in the estimated total cleanup cost as expense for that period in lieu of the pro-rata amount of the estimated total cleanup cost. This method could be applied only by entities not seeking to recover their costs through user charges.

199 The Board adopted this recommendation in light of the large number of Federal facilities that will be affected by this standard and the cost of implementing the standard.

****

APPENDIX B -- ILLUSTRATIONS OF CATEGORIES

200 In developing categories for Federal mission PP&E, Heritage Assets and Stewardship Land (See paragraphs 46, 57 and 66), the Board sought input from Federal agencies, the Standard General Ledger Issues Resolution Committee (SGLIRC), and other subgroup members. The Board found that there were many cases where similar assets could fit more than one category.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

201 For example, aircraft and ships are used by law enforcement agencies as well as by the Department of Defense. Under the proposed categories, only those used by the Department of Defense would meet the criteria for Federal mission PP&E. The illustrations provided are intended to clarify the application of the categories to actual assets.

ILLUSTRATION 1:
FEDERAL MISSION PROPERTY, PLANT, AND EQUIPMENT

ILLUSTRATION 1A:
COAST GUARD PP&E

202 The Coast Guard has unique duties as both a peacetime operating agency and one of the military services. Its mission includes:

- public safety,
- law enforcement, and
- service in the event of conflict, national emergency, or natural and man-made disasters.

203 The Coast Guard uses vessels and aircraft in its operations. Vessels include buoy tenders, buoy boats, and lifeboats. This is general PP&E rather than Federal mission PP&E. The cost of PP&E used in providing general government services (e.g., law enforcement) is relevant for assessing operating performance on a period-by-period basis since PP&E is used routinely in providing these services. The Coast Guard's accomplishments are linked to the inputs available to it (e.g., PP&E) and associating the cost of inputs with accomplishments or outputs is useful for assessing operating performance.

ILLUSTRATION 1B:
SPACE EXPLORATION EQUIPMENT

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

204 The application of the Federal mission PP&E characteristics to NASA's space shuttles is illustrated in this section. Of the three characteristics related to the use of the PP&E, the shuttle only meets the third--that is, it was specifically developed for use in a program for which there is no other program or entity using similar PP&E with which to compare costs.

205 Of the characteristics related to useful life, the shuttle meets the first--that is, it has an indeterminate or unpredictable useful life. A shuttle was first flown in 1981. Since that first flight, the fleet has completed 68 missions. Several factors would influence estimates of shuttles' useful lives:

- following the Challenger accident, the fleet was grounded for 32 months with some predicting that another similar accident could end the shuttle program,
- current schedules call for seven flights in 1996 but the space station project would require more frequent space shuttle flights in the future, and
- the possible development of a replacement vehicle which may be available by 2010.

206 Given the uncertainties and variables in estimating a useful life, it would be difficult, and not very meaningful, to assign the shuttle's acquisition cost to the shuttle's output--for example, flights. In the event that charges are made to users, NASA may wish to develop depreciation information for internal use only in setting prices. However, there is no broad need for depreciation information related to use of the shuttle.

207 Another example of space exploration equipment involves equipment that is used once and never recovered. The spacecraft Magellan was launched by a space shuttle in

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

1989 and is expected to burn up in the atmosphere around Venus. During the flight to Venus, the Magellan's signal was lost and recovered five times. In addition, many technical problems endangered the mission. However, in 1990, the Magellan reached Venus and began transmitting data back to NASA. Research based on this data is expected to continue for years following the life of the spacecraft. In contrast, the Mars Observer space probe disappeared during its approach to Mars and never reappeared.

208 Given the uncertainties involved in space exploration and the timing of any benefits, it is not useful to capitalize and depreciate space exploration equipment.

ILLUSTRATION 1C:
LAW ENFORCEMENT EQUIPMENT

209 A respondent to the ED Accounting for Property, Plant, and Equipment, questioned whether vehicles used in law enforcement activities qualified as Federal mission PP&E. It was noted that vehicles used for law enforcement purposes may have an abbreviated life expectancy. In addition, these vehicles may be modified for law enforcement uses.

210 However, in applying the two types of characteristics to these items of PP&E, one finds that they do not exhibit one characteristic from each category. The characteristics are repeated below for convenience.

211 Characteristics related to the use of the Federal mission PP&E are that it:

- has no expected nongovernmental alternative uses; or
- is held for use in the event of emergency, war or natural disaster; or
- is specifically designed for use in a program for which there is no other

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

program or entity (Federal or non-Federal) using similar PP&E with which to compare costs.

212 Characteristics related to the useful life are that it:

- has an indeterminate or unpredictable useful life [SEE NOTE 81] due to the unusual manner in which it is used, improved, retired, modified, or maintained, and
- is at a very high risk of being destroyed during use or premature obsolescence.

213 Vehicles used in law enforcement programs do not exhibit any of the three characteristics in the first group since (1) the basic vehicle can be used by other entities in other activities, (2) it is used routinely in operations rather than being held in anticipation of use, and (3) other entities, primarily state and local governments, have law enforcement activities and use similar vehicles. With regard to the second group of characteristics, the useful life may be abbreviated due to the manner in which it is used but it should nevertheless be predictable based on past experience with similar use. While it is possible that the vehicles are at somewhat greater risk of being destroyed than other vehicles, it is a matter of judgment whether this qualifies as very high risk. Overall, it is apparent that these items do not possess one characteristic from each group and do not qualify as Federal mission PP&E.

ILLUSTRATION 2:
HERITAGE ASSETS

214 Many assets are clearly heritage assets. For example, the National Park Service manages the Washington Monument, the Lincoln Memorial and the Mall. However, other assets, particularly Federal office buildings, have

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

historical, cultural or architectural significance as well as being used for general operations.

215 The Board has found that these multi-use heritage assets should still be categorized as heritage assets. Any costs to maintain the assets themselves should be treated as heritage assets. However, any costs that are operational in nature (e.g., reconfiguring of office space or modernized communications wiring) should be classified as general PP&E. Costs of these types of improvements or renovations would then be capitalized and depreciated--providing useful information for performance measurement.

216 For assets that are used solely for heritage purposes (e.g., the Washington Monument), the Board believes that the cost of operation, maintenance, and other periodic expenses combined with deferred maintenance disclosures, are sufficient to assess operating performance. Allocating the cost of heritage assets to accounting periods through depreciation would not enhance the information available for performance assessment.

217 Following are examples of general PP&E that exhibit characteristics of heritage assets.

ILLUSTRATION 2A:
MAJOR OFFICE BUILDING

218 A Federal agency constructed a central office building in 1950 to house its headquarters personnel. The building was subsequently placed on the historical registry but continued to serve as headquarters' office space.

219 Public tours are available and educational exhibits are provided in the hallways. However, public access is restricted to guided tours. The majority of floor space is devoted to offices, meeting rooms,

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

cafeterias, and storage.

220 The building is currently undergoing major renovations. The cost of these renovations should be capitalized and depreciated over their expected useful lives only to the extent that the work is tied to operations rather than to preserving the building. Additional information on the heritage nature of the asset would be provided through stewardship reporting.

ILLUSTRATION 2B:
NEW OFFICE BUILDING

221 A Federal facility previously used for industrial purposes (e.g., production of equipment parts) is being renovated and remodeled to serve as office space. The brick facade is being preserved because of its historic significance. Office space is being constructed inside of the brick facade.

222 The building can be viewed by visitors to the Federal facility, however, access to the office space will be restricted.

223 The original cost of the brick facade should not be included in the cost of the new office building. The cost of new construction should be capitalized and depreciated as part of general PP&E and none should be treated as a heritage asset. Additional information on the heritage nature of the existing brick facade, if material, would be provided through stewardship reporting.

ILLUSTRATION 2C:
LIBRARY OF CONGRESS

224 The Library of Congress is undergoing restoration and renovation. This includes:

- restoring artwork and architectural features,
- installing wiring for workstations, and
- building office space.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

225 Expenditures for restoration of heritage aspects of the buildings should be treated as a period cost for heritage assets. However, expenditures for operational aspects of the renovation should be categorized as general PP&E. Additional information on the heritage nature of the asset would be provided through stewardship reporting.

ILLUSTRATION 3:
LAND

226 The proposed standard provides that land acquired for or in connection with other general PP&E be included in that category. For example, the cost of land on which facilities are located would be included in general PP&E. Other land would be subject to stewardship reporting.

227 The following illustrations cover two potential issues associated with land. First, identifying land associated with general PP&E. Second, identifying land improvements as general PP&E or PP&E subject to stewardship reporting.

ILLUSTRATION 3A:
MILITARY USES OF LAND

228 In general, land used for military bases would be considered general PP&E. However, in some cases, land is used by the military as a site for missile silos, testing grounds or firing ranges. Land used for these purposes meets the definition of stewardship land. The Board believes that period-by-period cost information related to holding land for defense purposes is not relevant to assessing operating performance.

ILLUSTRATION 3B:
ROADS ON PUBLIC LANDS

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

229 Public lands have various types of roads to provide access. These types include:

- rough dirt roads created from years of use,
- dirt roads created by non-Federal land users (e.g., oil & gas exploration crews) and then abandoned, and
- roads created by Federal entities to provide access (e.g., gravel & paved roads).

230 Some of these roads are maintained while others merely exist until natural conditions overtake them.

231 Under private sector accounting, permanent improvements to land are included in the cost of land on the balance sheet. Typically, the cost of clearing and establishing the road bed is considered a permanent improvement because, with routine maintenance, it will remain indefinitely. Any pavement or gravel that must be replaced periodically would be considered depreciable PP&E. For a Federal entity, if the road could be categorized as general PP&E this practice would be appropriate since the period-by-period cost of assets is relevant for assessing operating performance.

232 For land subject to stewardship reporting, the cost of establishing the roadbed would be expensed in the year incurred since the land improved by the roadbed is not capitalized on the balance sheet. On the other hand, the paved and gravel roads are general PP&E because they are operational and the period-by-period cost is essential for assessing operating performance. The cost of pavement or gravel would be capitalized and depreciated. Decisions about the quality of the road conditions (e.g., how often roads are repaved) are an element of operating performance and of the cost of providing government services.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

****

APPENDIX C -- DEFERRED MAINTENANCE ILLUSTRATION

233 This appendix illustrates the footnote disclosures in paragraphs 77-83. The example shown here is for illustrative purposes only. Different entities may developed different asset categories, condition codes and descriptive terminology. The Board intends that this standard provide flexibility while providing relevant information on the condition of Federal assets. The following illustration presents text from a footnote meeting the requirements of the standard.

XYZ Hospital Facility

Note 4. Deferred Maintenance

XYZ operates a hospital facility at one of its remote sites. During the period maintenance expense is recognized as incurred. However, maintenance was insufficient over the past several years and resulted in deferred maintenance.

Information on deferred maintenance is based on an annual inspection of facilities. Standards are provided for evaluating facility condition. These standards include:

- minimum and desirable condition descriptions for facilities
- suggested maintenance schedules
- standard costs for maintenance actions
- standardized condition codes

There have not been material changes in the standards in recent years.

The following chart presents information on deferred maintenance on major categories of PP&E experiencing material amounts of deferred maintenance:

[SEE PRINTED COPY FOR TABLE 1]

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

****

APPENDIX D -- CLEANUP COST ILLUSTRATIONS

234 This appendix illustrates one method of complying with the standards proposed for cleanup costs. The examples shown in this appendix are for illustrative purposes only. There are many types of cleanup that may be accounted for under this proposed standard (e.g., nuclear facilities, landfills, or laboratories). Applying this proposed standard may require consideration of estimated cost components other than those shown here.

235 The computations are based on a formula allocating the estimated total cleanup costs (i.e., the total amount to be spent in the future to accomplish cleanup) to accounting periods. In identifying the amount to be expensed for the period, the formula considers the cumulative amounts:

- of capacity used at the end of the accounting period; and
- recognized as expense in prior accounting periods.

236 The components of the formula are defined below:

a = total cleanup cost estimated as of end of period
b = cumulative capacity used at end of period [SEE NOTE 82]
c = total estimated capacity [SEE NOTE 83]
d = amount previously recognized as expense-beginning of period
e = cleanup expense recognized in the current period

237 To calculate the appropriate expense amount, the following formula is used:

$$(a \times b/c) - d = e$$

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

238 Simply put, the end of period estimated total cleanup cost (a) is multiplied by the percentage of capacity used up at the end of that period (b/c) to arrive at the portion of cleanup cost that has been generated by operations through the end of the period. Theoretically, that amount of expense has been incurred and should be recognized. Amounts recognized as expense in prior periods (d) should be deducted to arrive at the current period expense amount (e). If this is the first period, the deduction for expense recognized in prior periods (d) is zero.

ILLUSTRATION 1:
HAZARDOUS WASTE DISPOSAL SITE

Operating Assumptions

239 The hazardous waste disposal site will begin accepting waste in 1995. The following assumptions apply:

- the site capacity is 100,000 cubic yards of waste
- it is estimated that the site will accept waste for ten years at an average rate of 10,000 cubic yards per year
- after the site is closed the following cleanup efforts are required by state, local and Federal laws:
  * site closure & sealing
  * thirty year monitoring
  * remediation
- 1995 cost estimates are based on current cost for 1995
- 1996 cost estimates are based on 1996 costs adjusted for inflation at a rate of 1.0%
- 1997 cost estimates are based on current costs for 1997 and include new technology and changes in monitoring requirements

RECOGNITION OF EXPENSE AND LIABILITY AMOUNTS

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

FOR 1995 (Dollars in thousands)

Estimated Total Cleanup Cost [SEE NOTE 84] based on Current Cost in 1995	
1. Site Closure and Sealing Cost:	
Facilities for monitoring operations	$ 100
Sealing site	750
Erosion and control facilities	500
2. Monitoring Cost (for a period of 30 years):	
Inspection	3,000
Sampling & Testing	2,250
Maintenance of facilities	300
3. Remediation Cost:	
Projected remediation based on statistical studies	500
TOTAL ESTIMATED CLEANUP COST	$7,400

Calculation of Annual Expense and Accrued Liability Amounts

This proposed standard would require that a portion of the estimated total cleanup costs be recognized as an expense and as a liability each period that the site operates. During 1995, the site accepts 15,000 cubic yards of waste. The following calculations show the amounts required to be recognized:

(a x b/c) - d = e
($7,400 x 15,000/100,000) - 0 = e
$7,400 x .15 = e
$1,110 = e

where:
a = total cleanup cost estimated as of end of period
b = cumulative capacity used at end of period [SEE NOTE 85]
c = total estimated capacity [SEE NOTE 86]
d = amount previously recognized as expense-beginning of period
e = cleanup expense recognized in the current

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

period

The following journal entry would be required:

Dr. Cleanup expense $1,110
Cr. Cleanup liability $1,110

To recognize estimated cleanup costs.

RECOGNITION OF EXPENSE AND LIABILITY AMOUNTS FOR 1996 (Dollars in thousands)

Estimated Total Cleanup Cost based on Current Cost in 1996

1. Site Closure and Sealing Cost:
   Facilities for monitoring operations $ 101
   Sealing site 758
   Erosion and control facilities 505
2. Monitoring Cost (for a period of 30 years):
   Inspection 3,030
   Sampling & Testing 2,273
   Maintenance of facilities 303
3. Remediation Cost:
   Projected remediation based on statistical studies 505
   TOTAL ESTIMATED CLEANUP COST $7,475

Calculation of Annual Expense and Accrued Liability Amounts

During 1996, the estimated total cleanup costs were adjusted for inflation of 1.0% and site accepted 10,000 cubic yards of waste. The following calculations show the amounts required to be recognized:

(a x b/c) - d = e
($7,475 x 25,000/100,000) - $1,110 = e
$7,475 x .25 - $1,110 = e
$759 = e

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

where:
a = total cleanup cost estimated as of end of period
b = cumulative capacity used at end of period [SEE NOTE 87]
c = total estimated capacity [SEE NOTE 88]
d = amount previously recognized as expense-beginning of period
e = cleanup expense recognized in the current period

The following journal entry would be required:

Dr. Cleanup expense $759
Cr. Cleanup liability $759

To recognize estimated cleanup costs.

In addition, the proposed standard would require that any material changes in the estimate due to changes in laws, technology, or cleanup plans be disclosed. However, there is no indication that material changes occurred.

RECOGNITION OF EXPENSE AND LIABILITY AMOUNTS FOR 1997 (Dollars in thousands)

Estimated Total Cleanup Cost Based on Current Cost in 1997

1. Site Closure and Sealing Cost:	
Facilities for monitoring operations	$ 115
Sealing site	740
Erosion and control facilities	500
2. Monitoring Cost (for 30 years):	
Inspection	2,250
Sampling & Testing	1,300
Maintenance of facilities	300
3. Remediation Cost:	
Projected remediation based on statistical studies	400
TOTAL ESTIMATED CLEANUP COST	$5,605

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

Calculation of Annual Expense and Accrued Liability Amounts

During 1997, a new estimate of total cleanup costs was prepared and the site accepted 10,000 cubic yards of waste. The following calculations show the amounts required to be recognized:

(a X b/c) - d =e
($5,605 x 35,000/100,000) - ($1,110 + 759)
$5,605 x .35 - $1,869 = e
$1,962 - $1,869 = e
$ 93 = e

where:
a = total cleanup cost estimated as of end of period
b = cumulative capacity used at end of period [SEE NOTE 89]
c = total estimated capacity [SEE NOTE 90]
d = amount previously recognized as expense-beginning of period
e = cleanup expense recognized in the current period

The following journal entry would be required:

Dr. Cleanup expense $93
Cr. Cleanup liability $93

To recognize estimated cleanup costs.

In addition, the proposed standard would require that material changes in estimated cleanup costs be disclosed and that amounts attributable to prior period operations be disclosed. One means of calculating this amount is to segregate the amount recognized as cleanup expense for the current period between "changes in estimated cleanup cost from prior periods" and "current period cleanup cost." These two amounts would be

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

disclosed.

Changes in estimated cleanup costs from prior periods are:

f = (a X b1/c) - d
f = ($5,605 x 25,000/100,000) - ($1,110 + 759)
f = $5,605 x .25 - $1,869
f = $1,401 - $1,869
f = $(468)

where:
a = total cleanup cost estimated as of end of period
b1 = cumulative capacity used at beginning of period [SEE NOTE 91]
c = total estimated capacity [SEE NOTE 92]
d = amount previously recognized as expense at beginning of period
f = changes in estimated cleanup cost from prior periods

Current period cleanup costs are:

g = e - f
g = $ 93 - $(468)
g = $ 561

where:
e = cleanup cost recognized in the current period
f = changes in estimated cleanup cost from prior periods
g = current period cleanup costs

SUMMARY:

FINANCIAL STMT.	1995	1996	1997
Operating expense	$1,110	$ 759	$ 93
Liability	$1,110	$1,869	$1,962

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

ILLUSTRATION 2:
NUCLEAR FACILITY QUALIFYING
AS GENERAL PP&E

Operating Assumptions

240 A nuclear facility was placed in operation in 1981. No recognition of cleanup cost was made under past accounting policy. At the end of 1995, the entity adopts the accounting policies presented in this proposed standard.

The following assumptions apply:
the entity has an expected useful life of thirty years
after the site is closed the following cleanup efforts are required by state, local and Federal laws:
- site closure & sealing
- thirty year monitoring
- remediation

1995 cost estimates are based on current cost for 1995

RECOGNITION OF LIABILITY AMOUNTS FOR 1995
(Dollars in thousands)

Estimated Total Cleanup Cost Based on Current Cost in 1995

1. Site Closure and Sealing Cost:	
Facilities for monitoring operations	$1,000
Sealing site	3,000
2. Monitoring Cost (for 30 years:	
Inspection	6,000
Sampling & Testing	3,000
Maintenance of facilities	600
3. Remediation Cost:	
Projected remediation based on statistical studies	2,000
TOTAL ESTIMATED CLEANUP COST	$15,600

Calculation of Liability Amount To be Recognized Upon Implementation

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

At the end of 1995, the estimated total cleanup costs was $15,600,000. The following calculations show the amounts that should have been recognized as of the end of 1995 if the proposed standard had been in effect since the facility began operating on October 1, 1980:

(a X b/c) - d = l
($15,600 x 15/30) - $0 = l
$15,600 x .5 - $0 = l
$7,800 = l

where:
a = total cleanup cost estimated as of end of period
b = number of years of operation
c = estimated useful life
d = amount previously recognized as expense-beginning of period
l = liability to be recognized at the end of 1995

Dr. Net Position $7,800
Cr. Cleanup liability
$7,800

To recognize estimated cleanup liability.

No expense is recognized in the year of implementation.

SUMMARY:

FINANCIAL STMT. 1995

Prior Period Adjustment $7,800
Liability $7,800

****

APPENDIX E -- GLOSSARY

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

Assets - Tangible or intangible items owned by the Federal Government which would have probable economic benefits that can be obtained or controlled by a Federal Government entity.

Book value - The net amount at which an asset or liability is carried on the books of account (also referred to as carrying value or amount). It equals the gross or nominal amount of an asset or liability minus an allowance or valuation amount.)

Business type activity - Significantly self-sustaining activity which finances its continuing cycle of operations through collection of exchange revenue (See FASAB Exposure Draft, Statement of Recommended Accounting Standards, Revenue and Other Financing Sources).

Capital leases - Leases that transfer substantially all the benefits and risks of ownership to the lessee.

Capitalize - To record and carry forward into one or more future periods any expenditure the benefits or process from which will then be realized. (Kohler's Dictionary for Accountants)

Cleanup costs - The costs of removing, containing, and/or disposing of (1) hazardous waste from property, or (2) material and/or property that consists of hazardous waste at permanent or temporary closure or shutdown of associated PP&E.

Condition assessment surveys - Periodic inspections of PP&E to determine their current condition and estimated cost to correct any deficiencies.

Cost object (also referred to as cost objective) - An activity, output, or item whose cost is to be measured. In a broad sense, a cost object can be an organizational division, a function, task, product, service, or a customer.

Deferred maintenance - Maintenance that was not performed when it should have been or was

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

scheduled to be and which, therefore, is put off or delayed for a future period.

Depreciation accounting - The systematic and rational allocation of the acquisition cost of an asset, less its estimated salvage or residual value, over its estimated useful life.

Direct Cost - The cost of resources directly consumed by an activity. Direct costs are assigned to activities by direct tracing of units of resources consumed by individual activities. A cost that is specifically identified with a single cost objective.

Disclosure - Reporting information in notes regarded as an integral part of the basic financial statements.

Discount rate - The interest rate used to adjust for the time value of money. (SFAS #87)

Donated capital - The amount of nonreciprocal transfers of assets or services from State, local, and foreign governments; individuals; or others not considered parties related to the Government. (Project on Standardization of Basic Financial Information Requirements of Central Agencies, JFMIP, October 1991)

Economic life - The period during which a fixed asset is capable of yielding services of value to its owner. (See "useful life".)

Expense - Outflows or other using up of assets or incurrences of liabilities (or a combination of both) during a period from providing goods, rendering services, or carrying out other activities related to an entity's programs and missions, the benefits from which do not extend beyond the present operating period. (Adapted from Kohler's Dictionary and FASB Concepts Statement No. 6)

Executory cost - Those costs such as insurance, maintenance, and taxes incurred for leased

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

property, whether paid by the lessor or lessee. (FASB, SFAS #13)

Good - A tangible product produced to provide to a customer.

Hazardous waste - A solid, liquid, or gaseous waste, or combination of these wastes, which because of its quantity, concentration, or physical, chemical, or infectious characteristics may cause or significantly contribute to an increase in mortality or an increase in serious irreversible, or incapacitating reversible, illness or pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported, disposed of, or otherwise managed.

Historical cost - Initially, the amount of cash (or its equivalent) paid to acquire an asset; subsequent to acquisition, the historical amount may be adjusted for amortization. (Kohler's Dictionary for Accountants)

Indirect cost - A cost that cannot be identified specifically with or traced to a given cost object in an economically feasible way.

Interest - The service charge for the use of money or capital, paid at agreed intervals by the user, commonly expressed as an annual percentage of outstanding principal. (Kohler's Dictionary for Accountants)

Liability - For Federal accounting purposes, a probable future outflow or other sacrifice of resources as a result of past transactions or events.

Life-cycle costing - An acquisition or procurement technique which considers operating, maintenance, and other costs in addition to the acquisition cost of assets.

Maintenance - The act of keeping fixed assets in useable condition. It includes preventive

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

maintenance, normal repairs, replacement of parts and structural components, and other activities needed to preserve the asset so that it continues to provide acceptable services and achieves its expected life. Maintenance excludes activities aimed at expanding the capacity of an asset or otherwise upgrading it to serve needs different from, or significantly greater than, those originally intended.

Market value - The estimated amount that can be realized by disposing of an item through arm's length transactions in the marketplace; the price (usually representative) at which bona fide sales have been consummated for products of like kind, quality, and quantity in a particular market at any moment of time.

Measurable - Can be determined with reasonable certainty or is reasonably estimable.

Operating lease - An agreement conveying the right to use property for a limited time in exchange for periodic rental payments. (Adapted from Financial Accounting: Principles and Issues, 4th Edition, Michael H. Granof and Philip W. Bell, p. 416.)

Opportunity Cost - The value of the alternatives foregone by adopting a particular strategy or employing resources in a specific manner. Also called Alternative Cost or Economic Cost.

Outputs - Any product or service generated from the consumption of resources. It can include information or paper work generated by the completion of tasks of an activity.

Output measure - A tabulation, calculation, or recording of activity or effort that can be expressed in a quantitative or qualitative manner. It shall have two key characteristics: 1) it shall be systematically or periodically captured through accounting or management information system, and 2) there shall be a logical connection between the reported measures and the program's purpose.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

Probable - That which can reasonably be expected or believed to be more likely than not on the basis of available evidence or logic but which is neither certain nor proven.

Product - Any discrete, traceable, or measurable good or service provided to a customer. Often goods are referred to as tangible products, and services are referred to as intangible products. A good or service is the product of a process resulting from the consumption of resources.

Recognize - To record an amount in entity accounts and to report that amount in the entity financial statements either individually or in aggregate with other amounts.

Service - An intangible product or task rendered directly to a customer.

Useful Life - The normal operating life in terms of utility to the owner.

Weapon System - A combination of one or more weapons with all related equipment, materials, services, personnel and means of delivery and deployment required for self-sufficiency.

Write-off - An action to remove an amount from an entity's assets or financial resources.

ENDNOTES

NOTE

1 Department of the Treasury, Financial Management Service, Consolidated Financial Statements of the United States Government,

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

prototype 1993, p. 23. The prototype statements provide gross historical cost investment amounts for all PP&E recorded by government entities. These amounts have not been audited.

NOTE 2 Land acquired for or in connection with general PP&E would be included in that category. Land not associated with general PP&E would be subject to supplementary stewardship reporting and is referred to throughout this document as stewardship land.

NOTE 3 Business-type activity is defined as a significantly self-sustaining activity which finances its continuing cycle of operations through collection of exchange revenue as defined in the Board's exposure draft on Revenue and Other Financing Sources.

NOTE 4 "Acquired for or in connection with other general PP&E" is defined as land acquired with the intent to construct general PP&E and land acquired in combination with general PP&E, including not only land used as the foundation, but also adjacent land considered to be the general PP&E's common grounds.

NOTE 5 "Balance sheet" refers to the statement that reports on assets, liabilities, and net position of the entity at the end of the reporting period. This statement is referred to in OMB Bulletin 94-01, Form and Content of Agency Financial Statements, as the Statement of Financial Position.

NOTE 6 "Statement of Net Cost" refers to the statement providing information on the entity's flows of exchange revenues, expenses, gains, and losses. The Board presented this new statement in its Statement

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

of Recommended Accounting Concepts No. 2, Entity and Display. In addition, the Board has exposed for comment a standard for reporting net costs and has provided an illustrative statement which might give effect to this standard in the ED on Revenue and Other Financing Sources, July, 1995.

NOTE
7 "Recognize" means to record an amount in entity accounts and to report a dollar amount on the face of the Statement of Net Costs or the Balance Sheet either individually or so that the amounts are aggregated with related amounts.

NOTE
8 "Depreciation" is the systematic and rational allocation of the acquisition cost of an asset, less its estimated salvage or residual value, over its estimated useful life.

NOTE
9 "Internally-developed software" means software developed by personnel employed by the reporting entity. This includes modifications made by entity personnel to purchased or contractor-developed software. Standards for internally-developed software are not to be applied to purchased or contractor developed software. The Board recognizes that contractor-developed software is conceptually similar to internally-developed software and that standards for each should be similar. The Board intends to address the inconsistent treatment of these items at a later date.

NOTE
10 "Disclosure" refers to reporting information in notes regarded as an integral part of the basic financial statements.

NOTE
11 The term "federal mission" refers to

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

activities that are typically Federal--such as national defense. In addition, Federal mission PP&E is limited to PP&E that would not typically be used by non-Federal entities. Clearly, any functions performed by a "Federal" entity could be labeled "Federal mission." The definition of this category clarifies the characteristics of PP&E appropriately includable in this category--a much narrower group than inferred by the category's title.

NOTE

12 This may be evidenced by the ability (1) to retire the PP&E and later return it to service or (2) to continually upgrade the PP&E to maintain its usefulness.

NOTE

13 FASAB's Statement of Recommended Accounting Standards No. 5, Accounting for Liabilities of the Federal Government, recommends the following definition for liability: a probable future outflow or other sacrifice of resources as a result of past transactions or events. The standards require recognition, in general purpose Federal financial reports, of probable and measurable liabilities arising from past exchange transactions; government-related injuries or damage; or non-exchange amounts that, according to current law and applicable policy, are due and payable to the ultimate recipient. The standards also provide guidance for disclosures related to liabilities that are not both probable and measurable at the balance sheet date.

NOTE

14 The term "probable" means that which can reasonably be expected or believed to be more likely than not on the basis of available evidence or logic but which is neither certain nor proven. For example, cleanup costs would be probable if (1) laws and regulations that have been approved as of the balance sheet date, regardless of the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

effective date of those laws and regulations, require cleanup or (2) compliance agreements (e.g., agreements with state or local authorities relating to the extent and the timing of remedial action) had been entered into by a Federal entity.

NOTE

15 Federal financial reporting should assist report users in evaluating the service efforts, costs, and accomplishments of the reporting entity; the manner in which these efforts and accomplishments have been financed; and the management of the entity's assets and liabilities. Federal financial reporting should provide information that helps the reader to determine:

a. the costs of providing specific programs and activities and the composition of, and changes in, these costs.

b. the efforts and accomplishments associated with Federal programs and the changes over time and in relation to costs.

c. the efficiency and effectiveness of the government's management of its assets and liabilities.

NOTE

16 Federal financial reporting should assist users in assessing the impact on the country of the government's operations and investments for the period and how, as a result, the government's and the nation's financial conditions have changed and may change in the future. Federal financial reporting should provide information that helps the reader to determine:

a. whether the government's financial position improved or deteriorated over the period.

b. whether the future budgetary resources will likely be sufficient to sustain public services and to meet obligations as they come due.

c. whether government operations have contributed to the nation's current and

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

future well-being.

NOTE
17 Useful life is the normal operating life in terms of utility to the owner. (adapted from Kohler's Dictionary for Accountants)

NOTE
18 "Land rights" are interests and privileges held by the entity in land owned by others, such as leaseholds, easements, water and water power rights, diversion rights, submersion rights, rights-of-way, and other like interests in land.

NOTE
19 Accounting for operating materials and supplies is addressed in Statement of Federal FInancial Accounting Standards No. 3 Accounting for Inventory and Related Property.

NOTE
20 The Federal Government sometimes retains an interest in PP&E acquired with grant money. In the event that the grant recipient no longer uses the PP&E in the activity for which the grant was originally provided the PP&E reverts to the Federal Government.

NOTE
21 Note that the criteria for identifying capital leases for financial reporting purposes differ from OMB criteria for budget scoring of leases. OMB Circular No. A-11, Preparation and Submission of Budget Estimates, includes criteria for identifying operating leases in Appendix B. OMB provides four additional criteria which relate to the level of private sector risk involved in a lease-purchase agreement. This is necessary because, for budget purposes, there is a distinction between lease-purchases with more or less risk. This distinction is not made in the financial reports and, therefore, FASAB does not include the four criteria related to

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

risk levels.

NOTE
22 "Operating leases" of PP&E are leases in which the Federal entity does not assume the risks of ownership of the PP&E. Multi-year service contracts and multi-year purchase contracts for expendable commodities are not capital leases.

NOTE
23 "Estimated economic life of leased property" is the estimated remaining period during which the property is expected to be economically usable by one or more users, with normal repairs and maintenance, for the purpose for which it was intended at the inception of the lease, without limitation by the lease term.

NOTE
24 "Fair value" is the price for which an asset could be bought or sold in an arm's-length transaction between unrelated parties (e.g., between a willing buyer and a willing seller). (adapted from Kohler's Dictionary for Accountants)

NOTE
25 "Base unit" refers to the level of detail considered in categorizing PP&E. Generally, the base unit is the smallest or least expensive item of property to be categorized. The term "base unit" may be used by others to have a different meaning--the meaning intended in this standard is limited to that specified above.

NOTE
26 The concept described here is intended for PP&E categorization purposes only. However, for the purpose of record keeping, greater detail may be necessary to maintain accountability for PP&E so that assets can be safeguarded against loss, theft, misappropriation, etc. Categorizing PP&E with

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

less detail considered does not necessarily mean that (1) accounting systems or (2) property records must follow the same level of detail.

NOTE
27 Business-type activity is defined as a significantly self-sustaining activity which finances its continuing cycle of operations through collection of exchange revenue as defined in the Board's exposure draft on Revenue and Other Financing Sources.

NOTE
28 The Board is not making a recommendation that cost comparisons actually be made. Nor is it suggesting that costs can be easily compared for a Federal and non-Federal entity. If the activities are somewhat comparable then one should presume that a cost comparison could be made.

NOTE
29 "Acquired for or in connection with other general PP&E" is defined as land acquired with the intent to construct general PP&E and land acquired in combination with general PP&E, including not only land used as the foundation, but also adjacent land considered to be the general PP&E's common grounds.

NOTE
30 "Interest costs" refers to any interest paid by the reporting entity directly to providers of goods or services related to the acquisition or construction of PP&E.

NOTE
31 "Internally-developed" means that employees of the entity are actively involved in developing the software. This is distinguished from contractor developed software and purchased software which are subject to the provisions of the PP&E standard.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

NOTE
32 Currently, the US Standard General Ledger includes an account titled Automated Data Processing Software, number 1830, which is not part of the PP&E account series. These standards do not require that software be accounted for as a component of the PP&E accounts. It is permissible to maintain a separate account for software and the accumulated amortization on software.

NOTE
33 In this case, users may be internal or external to the entity.

NOTE
34 Technological feasibility has been established when the entity has completed all planning, designing, coding, and testing activities that are necessary to establish that the software can meet its design specifications.

NOTE
35 See Statement of Recommended Accounting Standards No. 5, Accounting for Liabilities of the Federal Government.

NOTE
36 A will or clause of a will disposing of property.

NOTE
37 This paragraph applies only to exchanges between a Federal entity and a non-Federal entity. Exchanges between Federal entities shall be accounted for as transfers (See paragraph 31).

NOTE
38 If the entity enters into an exchange in which the fair value of the PP&E acquired is less than that of the PP&E surrendered, the PP&E acquired shall be recognized at its cost as described in paragraph 32 and subsequently reduced to its fair value. A loss shall be

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

recognized in an amount equal to the difference between the cost of the PP&E acquired and its fair value..

NOTE
39 SFFAS 3 requires that forfeited real and personal property be valued at market value less an allowance for any liens or claims from a third party.

NOTE
40 Delivery or constructive delivery shall be based on the terms of the contract regarding shipping and/or delivery. For PP&E acquired by a contractor on behalf of the entity (e.g., the entity will ultimately hold title to the PP&E), PP&E shall also be recognized upon delivery or constructive delivery whether to the contractor for use in performing contract services or to the entity.

NOTE
41 Software and land rights, while associated with tangible assets, may be classified as intangible assets by some entities. In this event, they would be subject to amortization rather than depreciation. "Amortization" is applied to intangible assets in the same manner that depreciation is applied to general PP&E--tangible assets.

NOTE
42 Land rights that are for a specified period of time shall be depreciated or amortized over that time period.

NOTE
43 A contra asset account is an account which partially or wholly offsets an asset account. On financial statements they may be either merged or appear together.

NOTE
44 For example, amounts realized may include cash received for scrap materials or fair

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

value of items received in exchange for PP&E removed from service.

NOTE
45 Net remaining cost is the original cost of the asset less any accumulated depreciation/amortization to date.

NOTE
46 "Major classes" of general PP&E shall be determined by the entity. Examples of major classes include buildings and structures, furniture and fixtures, equipment, vehicles, and land.

NOTE
47 The name "Federal Mission PP&E" may cause readers to erroneously assume that this category should include any PP&E supporting a Federal mission. Federal mission PP&E is limited to those items specifically identified herein as well as any other items exhibiting at least one characteristic from each of the two groups listed.

NOTE
48 This may be evidenced by the ability (1) to retire the PP&E and later return it to service or (2) to continually upgrade the PP&E to maintain its usefulness.

NOTE
49 Weapons are instruments of combat used to destroy, injure, defeat or threaten an enemy. (adapted from Dictionary of Weapons and Military Terms)

NOTE
50 Joint Chiefs of Staff, Department of Defense Dictionary of Military and Associated Terms, Joint Publication 1-02, March 23, 1994.

NOTE
51 Disclosure shall be either on the face of the statement of net cost or in footnotes depending on the materiality of the amounts

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

and the need to distinguish such amounts from other costs relating to measures of outputs or outcomes of the reporting entity.

NOTE
52 Disclosure shall be either on the face of the statement of net cost or in footnotes depending on the materiality of the amounts and the need to distinguish such amounts from other costs relating to measures of outputs or outcomes of the reporting entity.

NOTE
53 A will or clause of a will disposing of property.

NOTE
54 Theoretically, the amount of donated heritage assets should be included in the statement of net cost. However, the cost of providing this information is not warranted since heritage assets are more difficult to value than items that would typically be included in general PP&E.

NOTE
55 "Acquired for or in connection with other general PP&E" is defined as land acquired with the intent to construct general PP&E and land acquired in combination with general PP&E, including not only land used as the foundation, but also adjacent land considered to be the general PP&E's common grounds.

NOTE
56 Disclosure shall be either on the face of the statement of net cost or in footnotes depending on the materiality of the amounts and the need to distinguish such amounts from other costs relating to measures of outputs or outcomes of the reporting entity.

NOTE
57 A will or clause of a will disposing of property.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

NOTE
58 Acceptable services and condition may vary both between entities and among sites within the same entity. Management shall determine what level of service and condition is acceptable.

NOTE
59 This requirement applies to all four categories of PP&E.

NOTE
60 If management determines that there are no material amounts of deferred maintenance, this line item need not appear.

NOTE
61 Other methods may be used which are similar or identical to condition assessment survey or life-cycle costing. These methods would also be acceptable sources of information on deferred maintenance.

NOTE
62 Management shall determine what methods and standards to apply. Once determined, it is desirable but not required that methods and standards be applied consistently from period to period.

NOTE
63 "Major classes" of general PP&E shall be determined by the entity. Examples of major class include, among others, buildings and structures, furniture and fixtures, equipment, vehicles, and land.

NOTE
64 Examples of condition information include, among others, (1) averages of standardized condition rating codes, (2) percentage of assets above, at or below acceptable condition, or (3) narrative information.

NOTE
65 Adjustments may be necessary because the cost

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

of maintenance foregone may not be cumulative. For example, if periodic painting is skipped twice it is not necessarily true that the cost would be double the scheduled amount.

NOTE
66 Accounting for environmental liabilities such as cleanup costs is currently undergoing change--due to both improved measurement techniques and increased attention from the accounting community. The Board will monitor these changes and revisit these standards as needed.

NOTE
67 Probable means that the future confirming event or events is more likely than not to occur.

NOTE
68 The unit of analysis for estimating liabilities can vary based on the reporting entity and the nature of the transaction or event. The liability recognized may be the estimation of an individual transaction or event; or a group of transactions and events. For example, an estimate of the cleanup costs could be made on a facility by facility basis, or an entity by entity basis.

NOTE
69 Cleanup may be deferred for other reasons, such as availability of resources. However, this type of deferral does not affect the recognition of the liability.

NOTE
70 Laws and regulations approved as of the balance sheet date, regardless of the effective date of those laws and regulations, shall be considered.

NOTE
71 Note that land acquired for or in connection with general PP&E would be included in that

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_6.pdf.

category. All other land would be subject to stewardship reporting and is referred to throughout this document as stewardship land.

NOTE
72 The term "stewardship PP&E" is used to refer collectively to federal mission PP&E, heritage assets, and stewardship land.

NOTE
73 Objectives, paragraph 54.

NOTE
74 This may be evidenced by the ability (1) to retire the PP&E and later return it to service, or (2) to continually upgrade the PP&E to maintain its usefulness. In addition, PP&E that is held for "one-time" use, such as a warhead, has an indeterminate life.

NOTE
75 Internally-developed software may be a component of general PP&E or stewardship PP&E.

NOTE
76 In fact, the majority of private-sector entities do not capitalize the cost of internally-developed software. The Financial Accounting Standards Board has not developed guidance on this issue.

NOTE
77 FASAB Exposure Draft, Accounting for Property, Plant, and Equipment, February 28, 1995, page 19, paragraph 71, Item IC.

Aeronautics and Space Administration.

NOTE
80 FASAB, Recommended Accounting Standard No. 5, Accounting for Liabilities, September 1995.

NOTE
81 This may be evidenced by the ability (1) to retire the PP&E and later return it to service or (2) to continually upgrade the PP&E to maintain its usefulness.

NOTE
82 If recognition of the costs is based on the passage of time rather than physical capacity, the cumulative amount of time passed since the associated PP&E began operating shall be substituted.

NOTE
83 If recognition is based on the passage of time, the estimated useful life of the associated asset shall be substituted.

NOTE
84 This estimate includes any costs of any cleanup efforts required during the thirty year cleanup period. While these activities will not occur until the associated PP&E is closed, the costs are estimated at the current cost to conduct similar efforts.

NOTE
85 If recognition of the costs is based on the passage of time rather than physical capacity, the cumulative amount of time passed since the associated PP&E began operating shall be substituted.

NOTE
86 If recognition is based on the passage of time, the estimated useful life of the associated asset shall be substituted.

NOTE
87 If recognition of the costs is based on the

Implementation Guide to Statement of Financing in Statement of Federal Financial Accounting Standards 7, *Accounting for Revenue and Other Financing Sources*: Detailed Information on the Statement of Financing

April 2002

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

This implementation guide presents explanations of concepts and standards intended to help practice and understanding. In April 2000, the American Institute of Certified Public Accountants established the hierarchy of accounting principles for Federal government entities (see Statement of Auditing Standards 69 and 91 and Office of Management and Budget (OMB) Bulletin 01-09, section 1.2) wherein *Implementation Guides* occupy level "D." However, the financial statement formats illustrated in this *Implementation Guide* are not intended to be authoritative. They provide a framework, consistent with and amplifying the OMB's periodic bulletins on the form and content of agency financial statements (see OMB Bulletin 01-09), within which individual entities have the flexibility to provide useful information.

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

I. INTRODUCTION

1. This implementation guide provides detailed information about the statement of financing in the Federal Accounting Standards Advisory Board (FASAB–"The Board") Statement on Federal Financial Accounting Standards (SFFAS) No. 7, *Accounting for Revenue and Other Financing Sources and Concepts for Reconciling Budgetary and Financial Accounting* (SFFAS 7). It is organized by the following sections:

    - Background of the statement.
    - Basic construction of the statement.
    - Explanation of lines on the illustrative format of the statement provided by the Office of Management and Budget (OMB).
    - Additional illustrative items.

2. This implementation guide supersedes pars. 72-93 and 122-173 of FASAB's *Implementation Guide to Statement of Federal Financial Accounting Standards No. 7,* Accounting for Revenue and Other Financing Sources" (June 1996) (IG7) and *Special FASAB News Article No. 1 on the Statement of Financing* (original, dated August 1998, and revised version, dated March 1999). The guide discusses concepts and the reporting in general and does not provide the pro forma entries of IG7. The United States Standard General Ledger (USSGL) accounts and related pro forma entries and case scenarios are available on the Financial Management Service (FMS) Web site, www.fms.treas.gov/ussgl.

Background of the Statement of Financing

3. Prior to the issuance of SFFAS 7 in April 1996, the principal financial statements required of federal agencies were a balance sheet and a combined statement of operations and changes in net position. The nature and organization of the information in the combined statement of operations and changes in net position was insufficient to provide information on the cost of federal programs and contained numerous vagaries which did not provide readers of the financial statements useful information. The Board dealt with this in Statement of Federal Financial Accounting Concepts (SFFAC) 2, *Entity and* Display, and in SFFAS 7 by providing requirements for primary information grouped by statements of net cost, changes in net position, and custodial activity.[1]

1 Federal Accounting Standards Advisory Board, *Implementation Guide to Statement of Federal Financial Accounting Standards No. 7,* Accounting for Revenue and Other Financing Sources (June 1996), (*Implementation Guide*) pars. 7-10, 14-20.

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

4. Because almost no budgetary information was provided in either the balance sheet or other new statements, the Board required in SFFAS 7 primary budgetary information encompassed in a statement of budgetary resources, which paralleled existing information federal agencies provided OMB, but at a higher level of reporting. This filled a major gap in the credibility and usefulness of the primary financial statements.[2]

5. In addition, because substantial budgetary information was being required in the primary financial statements for the first time, and because the obligation-based budgetary information was different in many respects from the proprietary (accrual-based) statements, the Board also prescribed additional primary information to help explain the differences between the obligation-based budgetary and accrual-based proprietary statements.[3] The Board prescribed a "statement of financing" as the vehicle to show the relationship between those two key figures.

6. The requirements of SFFAS 7 were effective beginning for reporting periods after September 30, 1997. The actual format for agency financial statements is prescribed by OMB. In its Bulletin 97-01, *Form and Content of Agency Financial Statements*, which was also effective for those same reporting periods, OMB adopted as an illustration the condensed statement illustrated in SFFAS 7.[4] The nature of the statement can be seen in the organization of that illustration, and is discussed in the next section of this report.

7. Subsequently, in Bulletin 01-09 that replaced Bulletin 97-01 in September 2001, OMB issued a more detailed illustration of the statement of financing along the lines presented in FASAB's *Special Newsletter No. 1 on the Statement of Financing*, which had served as an unofficial illustration and detailed narrative of the statement's construction and approaches to its preparation.[5] The lines in the new OMB illustration are discussed in a subsequent section of this guide.

8. Additionally, the USSGL Board has issued increasingly-comprehensive crosswalks from budgetary and proprietary Standard General Ledger accounts to the statement of financing which, with the other guidance mentioned, has also helped agencies to prepare their statement of financing.[6] The final section of this document covers some additional reporting situations which may be further useful to agencies in preparing the statement of financing.

6 Financial Management Service, *U.S. Government Standard General Ledger [SGL]* (July 2001), pp. V-51 through V-66.

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

9. Understanding the statement of financing requires a knowledge of not only the federal proprietary accounting for assets, liabilities, net position, and components of net position, but also of the budgetary accounting for resources and the status of those resources as obligated or unobligated. Such knowledge, basic to federal accounting and auditing, including the design and maintenance of computer systems which organize and store data and generate financial reports, is assumed of the readers of this guide.

10. This guide uses the new OMB Bulletin 01-09 illustrations of the statement of financing and other statements to explain the underlying statement of financing concepts. The Federal agencies are working with Bulletin 01-09 and the illustrations therein and a close adherence to them was deemed essential for this guide.

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

II. BASIC CONSTRUCTION OF THE STATEMENT OF FINANCING

11. The statement of financing explains the difference between the budgetary net obligations and the proprietary net cost of operations by setting forth the items that reconcile the two amounts.[7] To understand the statement of financing, it is necessary to understand why these two key figures are different. They are different because (1) the net cost of operations may be financed by non-budgetary resources; (2) the budgetary and non-budgetary resources used by an agency may finance activities which are not components of the net cost of operations; and (3) the net cost of operations may contain components which do not use or generate resources in the current period.

12. With this in mind, the statement of financing has three major sections which, when properly detailed, yield the net cost of operations. A skeleton listing of the sections is shown in figure 1, below.

Figure 1:
SECTIONS OF THE STATEMENT OF FINANCING

RESOURCES USED TO FINANCE ACTIVITIES
Budgetary
Other

RESOURCES USED TO FINANCE ITEMS NOT PART OF THE NET COST OF OPERATIONS
Resources used that involve gross obligations or resources not reported in the Federal budget
Those involving recoveries and offsetting collection activity

COMPONENTS OF NET COST OF OPERATIONS WHICH DO NOT GENERATE OR USE RESOURCES IN THE REPORTING PERIOD

Components requiring or generating resources in future periods
Components not requiring or generating resources

NET COST OF OPERATIONS

7 SFFAS 7, par. 92.

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Budgetary Resources Used to Finance Activities

13. The first section of the statement of financing is "resources used to Finance activities." Resources include those provided through the Federal budget and those not accounted for in the budget, which are designated "other" in the table.

14. ***Budgetary resources*** means "net obligated resources," as defined in the context of the statement of budgetary resources. This is a critical definition for the statement of financing. Care must be taken not to confuse this with total resources, e. g., with total appropriations received and available, as the statement of financing is not concerned with total resources, or restrictions on OMB's ability to apportion or the agency's ability to allot total resources. A resource does not finance an activity unless it is obligated, and, hence, the statement of financing includes only obligated resources. Gross obligations – those reported on line 8 of the statement of budgetary resources illustrated in OMB Bulletin 01-09 (see Appendix D) – consist of:

    (1) undelivered orders for goods and services or benefits to be provided, both with and without advances or prepayments, and
    (2) delivered orders for goods and services or the provision of benefits, both paid and still payable.[8]

15. It should be noted that the amount reported on line 8 of the OMB illustration (see Appendix D) is the difference between the beginning and ending balances of undelivered and delivered orders. If, for example, the beginning amount of orders was $100 and the ending amount was $250, the amount reported as new obligations during the period would be the difference, which is $150. Since any component of obligations can either increase or decrease during the year, its arithmetic contribution to the amount of new obligations for the reporting period could be positive or negative, except for delivered orders paid, which cannot be negative.[9]

16. This is illustrated with the following example. Here, and throughout this guide, small numbers are used to simplify illustration and comprehension, and lines may be abbreviated or paraphrased to fit reasonably into available space or to better support topics discussed.

8 See the definitions for "obligated balance" and "obligations" in OMB Circular A-34, *Instructions on Budget Execution* (November. 3, 2000), p. 4, and the account definitions for the 4800 and 4900 series of accounts in *USSGL*, pp. II-52 through II-56.

9 See, e.g., US*SGL,* Section V, crosswalk items for line 6, "obligations incurred," of the Statement of Budgetary Resources, p. V-46.

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Component	Ending Balance	Beginning Balance	Change
Undelivered Orders w/o Advance	$250	$100	+$150
Undelivered Orders w/Advance	50	75	- 25
Delivered Orders Payable	100	150	- 50
Delivered Orders Paid	500	0[10]	+ 500
Total Obligations	$900	$325	+$575

17. The amount reported for gross obligations on line 8 of the statement of budgetary resources would be $575. The importance of knowing the amount of the computation for each individual component, including its arithmetic sign, will become clear in the next section, which discusses the lines for the statement of financing illustrated in OMB Bulletin 01-09.

18. The Board prescribed reconciling gross rather than net obligations with net cost of operations. Net obligations is defined for most agencies as the difference between gross obligations and

    (1) recoveries of prior-year authority not involving cash and
    (2) offsetting collection activity,[11] which is comprised of

    - actual cash collections,
    - budgetary accounts receivable (i.e., receivables recognized as budgetary resources in the Federal budget), and
    - unfilled customer orders (orders received by an agency to provide goods and services to the requesters, both with and without advances, with the caveat that in most cases, orders from the public without advances cannot be accepted).

    Offsetting collection activity may include more than actual cash collections.[12]

19. Recoveries of prior-year obligations not involving cash occur when obligations made in prior years are cancelled in the current year or are filled in an amount less than originally recorded. For example, a purchase order without an advance may be placed for, say, $100 in Year A. In Year B, the goods or services ordered are received, and the bills are $98. In that case, there is a recovery in Year B of the $2 difference. Of course, if the order was canceled in Year B, with no goods or services received, the entire $100 would be reported as a recovery in Year B. Recoveries of prior-year obligations are found in OMB Bulletin 01-09 illustration of the statement of

10 As readers should be aware, the beginning balance of paid delivered orders will always be zero, because the balance of the ledger accounts for this are brought to zero at the end of the year in the adjusting and closing processes. (See US*SGL*, closing entry F214, p. III-159.)

11 This can be seen in OMB Bulletin 01-09 illustration of the statement of financing, lines 1-5, on p. 46.

12 *OMB Circular A-34*, p. 4, and *USSGL* definitions for accounts 4221, 4222, 4225, 4251, and 4252, e.g. (p. II-43).

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

budgetary resources on line 4.[13] With respect to recoveries where the availability of the funds for future obligation has expired or been canceled, the recovery is offset by a withdrawal of funds, which eliminates any difference between net obligations and the net cost of operations.[14]

20. Offsetting collection activity is found in that illustration, as well. Actual cash collections are reported in that illustration on line 3(a)1; budgetary accounts receivable are reported on line 3(a)2; and unfilled customer orders are reported on line 3(b). The OMB illustration labels line 3(a)2 as "receivable from Federal sources."[15] This is because that absent legislation to the contrary, receivables from the public do not count as budgetary resources and would not be reported on the statement of budgetary resources.[16]

21. A further caveat should be noted in determining the amount of collecting activity from federal receivables and from unfilled customer orders. The amount reported on the statement of budgetary resources is determined as the *change* in these items from the beginning to the end of the reporting period rather than their balances at the end of the period. The OMB illustration indicates in the line caption that the amount for unfilled customer orders is the change in the dollar amount of those orders, but it does not indicate that for the receivables.[17]

22. "Offsetting" in the term "offsetting collections" means that the resources generated by the collecting activity are added to expenditure accounts[18] and hence "offset" gross obligations. In a sense, the budgetary cost of an agency is its gross obligations less its offsetting collections and distributed offsetting receipts (i.e., the offsetting receipts distributed to that agency).[19]

23. OMB Bulletin 01-09 required one additional item on the statement of financing to be included in determining net obligations that had not previously been used. The term

13 OMB Bulletin 01-09, p. 41.

14 See OMB Circular A-34, *Instruction on Budget Execution*, section 30, for the treatment of recoveries of prior-year obligations for expired accounts.

15 OMB Bulletin 01-09, p.41.

16 Note that OMB Bulletin 01-09 captions the line for receivables on the statement of budgetary resources, line 3.b.1, as "receivable from federal sources." This is consistent with the related presentations in the SF-132, "Apportionment and Reapportionment Schedule, and SF-133, "Report on Budget Execution and Budgetary Resources," and related instructions, in *OMB Circular A-34*, pp. 57, 73, 99, and 117.

17 OMB Bulletin 01-09, p. 41.

18 The budget distinguishes between receipt accounts and expenditure accounts. "Receipts" are collections from the public primarily from the exercise of the Government's sovereign power, e.g., income and payroll taxes. Outlays are disbursed or made from expenditure accounts. See OMB Circular A-11, *Preparing and Submitting Budget Estimates*, section 20 generally, and especially section 20.7.

19 The budget records money collected by Government agencies two different ways. Depending on the nature of the activity generating the collection, they are recorded either as (1) ***receipts***, which are compared in total to net outlays; or (2) ***offsetting collections*** or ***offsetting receipts***, which are deducted from gross outlays to produce net outlays.

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

for that item is "offsetting receipts," which sounds the same as offsetting collections but there is a basic difference. Offsetting collections are included in the entity's expenditure accounts and thus are usually available for spending for the purposes of the account without further action by Congress. If the law does not authorize crediting offsetting collections to an expenditure account, the entity must credit them to a receipt account, and they are deemed "offsetting receipts." Offsetting collections are thus deducted from gross budgetary authority and outlays at the expenditure account level. Offsetting receipts are usually deducted at the agency-wide level, i.e., from the gross budget authority and outlays of the agency that conducts the activity generating the receipts, though in a few cases they are deducted at the government-wide level. [20]

24. One example of offsetting receipts is found in federal credit programs under the Credit Reform Act of 1990. Under that Act, negative subsidies and downward re-estimates of subsidy expense for direct loan and loan guarantee programs are deposited by a credit agency to designated miscellaneous receipt accounts (or other designated accounts).[21] These monies are not available to the agency to use in its operations unless specifically authorized by law, but they are associated with the agency in the Federal budget. Hence, they constitute "offsetting receipts," and must be deducted from gross obligations of an agency to determine net obligations.[22]

25. There are a great many other examples of offsetting receipts, but regardless of their source, the key is that they are associated with the collecting agency in the Federal budget. Care must be taken not to confuse them with custodial collections, which are amounts collected for others and associated with those others in the Federal budget. The Internal Revenue Service and Department of Customs make collections of income taxes and customs duties, respectively, and they are deposited into designated accounts of the Treasury, which are unavailable to either for use in its operations. However, these amounts are not associated with the collectors in the Federal budget, and do not reduce the budgetary costs of the collectors. Hence, they are not offsetting receipts and do not enter the computation of net obligations for the collecting entities.[23]

---

20 *OMB Circular A-34*, p. 4. Also see *Analytical Perspectives* in the FY 2003 United States budget series of publications, chapter 5, "User Fees and Other Collections," pages 83-94, and chapter 25, "Budget Systems and Concepts," pages 432-34 for additional information on offsetting collections and offsetting receipts. The purpose of subtracting offsetting collections and offsetting receipts from gross outlays rather than adding them to taxes on the receipt side of the budget is to produce budget totals for receipts, outlays, and budget authority in terms of the amount of resources allocated governmentally, through collective political choice, rather than through the market.

21 In limited instances, deposits are made to special fund receipt accounts rather than to miscellaneous receipts accounts, which has different requirements for reporting the fund balance with Treasury. However, these requirements do not affect the statement of financing.

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

26. Based on this information, the computation of net obligations can be summarized as shown in figure 2, below.

Figure 2:
COMPUTATION FOR NET OBLIGATIONS[a]

1. Gross obligations (line 8 of the OMB Bulletin 01-09 Illustration of the Statement of Budgetary Resources)

2. Less recoveries of authority (line 4)

3. Less offsetting collections of cash (line 3.a.1)

4. Less the change in budgetary receivables[b] (line 3.a.2)

5. Less the change in unfilled customer orders[b] (line 3.b)

6. = Net obligations before deducting offsetting receipts, or, said another way, Gross obligations less offsetting collections (used in the larger sense of the word to mean "offsetting collecting activity, the combination of lines 2, 3, 4, and 5 of this table)"[c, d]

7. Less offsetting receipts

8. = Net obligations

[a]The computations in this table include both the budgetary and non-budgetary columns of the statement of budgetary resources.

[b]Note that because these lines are "subtraction lines," the arithmetic sign used would be opposite that for the change in the items. If there were an increase, the arithmetic sign would be a minus. If there were a decrease, the arithmetic sign would be a plus.

[c]Note that agencies may not have any offsetting receipts. When that is the case, line 6 is net obligations.

[d]A few agencies also have transfers from trust funds, which is a separate item to be deducted in the computation for line 6 and appears on line 3.d on the statement of budgetary resources. The line is not indicated here because of its limited applicability.

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

27. The net obligations amount constitutes the budgetary resources that finance activities in figure 1, and is the budgetary amount that is to be reconciled with the net cost of operations on the statement of financing.

28. A further caveat regarding consolidation may be made here. The statement of financing is a consolidated statement. However, in computing net obligations, combined amounts, as found on the statement of budgetary resources, rather than consolidated amounts are used. Although the Federal budget reports a consolidated amount for net obligations, its method of consolidating is to decrease the *total* obligations, without elimination for inter-entity transactions, by the *total* recoveries and offsetting collection activity, without elimination for inter-entity transactions. The amount of obligations is the same in either case.[24]

29. Assume, for example, that a reporting entity has two sub-components, A and B. Suppose that entity A obligates resources to make a $10 disbursement to B, which records the transaction as an offsetting collection. Combined and consolidated approaches to reporting this are shown below.

	Combined Reporting	**Consolidated Reporting**
Obligated Resources	$10	$-0-
Offsetting Collections	(10)	-0-
Net Obligated Resources	$-0-	$-0-

30. Note that under the combined approach, both the obligation and the offsetting collection are reported, although they are between components of the same entity. Under the consolidated approach, the intra-entity transactions are eliminated. In either case, the net obligations (net obligated resources) are the same. OMB Bulletin 01-09 requires that the combined approach be used for reporting the lines leading to net obligated resources on the statement of financing, which makes the statement traceable to the Federal budget and to agency information sent to OMB that goes into the compilation of the Budget. It also requires that the remainder of the statement be consolidated on a "line-by-line" basis.[25]

Other Resources Used to Finance Activities

31. One of the reasons that the net obligations does not equal the amount of the net cost of operations is that there are resources which are not reported in the Federal budget which may finance the net cost of operations or other activities of the agency. These resources must be included in order to report the total resources from all sources that finance activities.

24 OMB Bulletin 01-09, pp. 6, 39-40.

25 OMB Bulletin 01-09, pp. 6, section 1.8, and 47-50.

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

32. The "other" resources are taken from the "other financing sources" section of the statement of changes in net position illustrated in OMB Bulletin 01-09 (see Appendix C). That section is comprised of lines 12 through 15, which are designated for donations and forfeitures of property (line 12), transfers-in and -out of property from one federal agency to another without reimbursement (line 13), financing sources imputed for costs of the reporting entity which are absorbed by others (line 14), and any additional financing sources which are not reported in the Federal budget (line 15). Care should be taken to realize that transfers-out would have an arithmetic sign of minus in the computation of total "other" resources. Similarly, line 15, which is for any additional items not delineated in the illustration, might have some items that would have an arithmetic sign of minus.

33. The combination of the net budgetary resources obligated and the resources not reported in the Federal budget constitute the total resources used to finance activities on the statement of financing.

Resources Used to Finance Items not Part of the Net Cost of Operations

34. Some resources clearly finance the net cost of operations. For example, consider the expense for a guard service. There would be obligated budgetary resources for the amounts due or paid to the guard service and these amounts would have been expensed. Because the obligated resources and the net cost of operations (the expense for the guard service) would be the same, there would be nothing to reconcile on the statement of financing.

35. However, not all resources finance the net cost of operations. While the next main section of this report, explaining the lines illustrated in the OMB Bulletin 01-09 illustration for the statement of financing, lists a number of these items, which are discussed there, two illustrations will be given here.

36. The first illustration is the acquisition of $1,000 of property, which is capitalized as an asset. Property could be acquired either through the obligation of budgetary resources, by donation from the public, or by transfer-in from another federal agency without reimbursement. The source of the financing, whether budgetary or non-budgetary resources, would appear in the first section of the statement of financing as a resource used to finance activities. However, the "activity"–the acquisition of the property–did not result in expense or exchange revenue, which are the components of the net cost of operations. To explain why resources are $1,000, but the net cost of operations is zero, there needs to be a listing in the section "resources which do not finance the net cost of operations" for acquisition of property. When this is entered, the statement of financing then reports resources of $1,000, subtracts resources which do not finance the net cost of operations in the amount of $1,000, and yields the net cost of operations, zero.

37. Similarly, items that may involve offsetting collecting activity do not affect the net cost of operations. Suppose, for example, that the unfilled customer orders increased by $10 during the reporting period. Reviewing figure 2, line 5, this would decrease net

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

obligated resources by $10, because the change is subtracted. However, the change does not affect the net cost of operations, because it has no effect at all on the proprietary accounts, unless an advance is received, in which case only the asset Fund Balance with Treasury and the liability Advances from Others is recorded. No exchange revenue is recognized from the acceptance of an order to provide goods and services to the requester. Recognition of revenue would occur only when the orders were filled and resulted in a receivable or a cash collection. Hence, the net budgetary resources obligated would be -$10, and the net cost of operations would be zero. The difference is explained in the section on resources which do not finance the net cost of operations, and would be entered as +$10. When this is entered, the statement of financing reports resources of -$10, removes resources which do not finance the net cost of operations in the amount by adding back the $10, and yields the net cost of operations, zero.

38. If unfilled customer orders had *decreased* by $10 instead, the statement of financing would explain the difference between resources and net cost of operations in the same manner. The net obligated budgetary resources would be +$10 in this case, because since the change in unfilled customer orders is subtracted from gross obligations, the subtraction of the decrease (-$10) results in an arithmetic sign of plus. Net cost of operations is still zero, and the $+10 would be removed in the section on resources which do not finance the net cost of operations. Resources would be +$10; $10 of resources not financing the net cost of operations would be subtracted; and this would yield the net cost of operations, zero.

Components of Net Cost of Operations that Do Not Generate or Use Resources in the Reporting Period

39. Removing from total resources the resources that do not finance the net cost of operations leaves the resources that *do* finance the net cost of operations, but this is still not the amount reported for the net cost of operations. This is because some of the components of net cost do not use or generate resources in the reporting period. These components can be grouped into two general categories: those that will generate or use resources in subsequent reporting periods and those that will not.

40. The first category can be illustrated through the expense recorded for an accrual to increase an agency's liability for annual leave at the end of the year because employees earned more leave than they took. This proprietary transaction increases the expense for annual leave benefits and correspondingly increases the annual leave liability. However, it has no effect on the budgetary accounts, because Congress does not fund annual leave on an accrual basis. It is financed when it is taken and the amounts are paid to the employees who took the leave. Thus, resources are zero, but the net cost of operations includes the amount of the accrued leave.

41. Assuming an accrual of $10, then, resources would be zero, and the net cost of operations would be $10. The difference would be explained by adding $10 in the statement of financing section on components of net costs, which do not use

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

resources and indicating that it was for the increase in the annual leave liability for the year. When this is done, resources are zero, components of net costs not using resources are $10, and the two together yield the $10 net cost of operations.

42. The annual leave example was a case in which the expense would be financed in a subsequent period. At such time in succeeding years as employees take the leave that was accrued, they will be paid for it, and budgetary resources will be obligated for that payment. There are other cases, however, where components of net cost of operations will not use or generate resources in the current or future periods.

43. A common example of that is for depreciation on capitalized assets. Suppose that the $1,000 of capitalized property acquired in our previous illustration was to be depreciated for $100 in the current period. In that case, $100 of depreciation expense will be recorded, and the net cost of operations will thus be $100.

44. There is no budgetary effect of a transaction to record depreciation. An agency's budget is concerned with acquiring assets, not in their subsequent use. Hence, while resources will be obligated to acquire capitalized property, no budgetary accounts are affected by its subsequent depreciation. Because of this, the depreciation transaction would result in resources of zero and net cost of operations of $100. The reconciling factor, reported in the section on components of net cost, which do not use resources, would be the depreciation of $100. The zero resources plus the $100 of net cost components not using resources would yield the $100 net cost of operations.

Net Cost of Operations

45. The net cost of operations must be computed by totaling the statement of financing sections on (1) resources, (2) resources which do not finance net cost of operations, and (3) components of net cost of operations which do not generate or use resources in the reporting period. The amount thus derived must equal the amount reported for net cost of operations on the statement of net cost (line 10 of the OMB Bulletin 01-09 illustration for that statement – see Appendix B). That same amount also appears in the net cost of operations on line 17 of the OMB Bulletin 01-09 illustration for the statement of changes in net position.

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

IV. EXPLANATION OF LINES ON THE ILLUSTRATIVE STATEMENT OF FINANCING IN OMB BULLETIN 01-09, *FORM AND CONTENT*

46. The preceding narrative discussed the concepts of the structure of the statement of financing. This section expounds on those concepts by explaining how specific lines on the statement of financing illustrated in OMB Bulletin 01-09 are used to disclose the differences between net obligations (net budgetary resources obligated), and net cost of operations.

47. While the illustration in the OMB Bulletin provides the basis for the discussion in this section, the actual format used by an agency need not have exactly the same line items or the same words captioning the line items or the headings. However, it must contain the major sections to set forth the resources, those resources, which do not finance the net cost of operations, and those components of net cost of operations, which do not require or generate resources during the reporting period[26]. The result of combining the sections must be the amount of the net cost of operations, with the statement then explaining to the reader why the net obligations and the net cost of operations are different.

48. The OMB illustration for the statement of financing is reproduced in Figure 3, below (this illustration is also presented in Appendix A).[27] The comparative columns are omitted for purposes of simplifying the display, as they do not add to the theory underlying the statement. Of course, agencies must present comparative information in their statements in accordance with time schedules specified in OMB Bulletin 01-09.[28]

29 OMB Bulletin 01-09, pp. 35, 41-42, 46-47.

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

51. As can be seen from the table, no additional work is required to prepare the first section of the statement of financing. Every figure must already be computed for another financial statement.

Resources Used to Finance Items Not Part of the Net Cost of Operations (Lines 12-17)

52. Figure 6 reproduces the second section of the statement of financing, "resources that do not finance the net cost of operations," or, said another way, resources used to finance items *not* part of the net cost of operations.

Figure 6:
Resources Used to Finance Items not Part of the Net Cost of Operations

Resources Used to Finance Items not Part of the Net Cost of Operations	
12. Change in budgetary resources obligated for goods, services and benefits ordered but not yet provided (+/-)	xxx
13. Resources that finance expenses recognized in prior periods	xxx
14. Budgetary offsetting collections and receipts that do not affect net cost of operations	
14a. Credit program collections which increase liabilities for loan guarantees or allowances for subsidy	xxx
14b. Other	xxx
15. Resources that finance the acquisition of assets	xxx
16. Other resources or adjustments to net obligated resources that do not affect net cost of operations (+/-)	xxx
17. *Total resources used to finance items not part of the net cost of operations*	xxx
18. *Total resources used to finance the net cost of operations*	x,xxx

53. **Line 12** is used to explain the difference between the total resources used to finance activities and the net cost of operations because of the change in "budgetary resources obligated for goods and services and benefits ordered but not yet provided," i.e., "undelivered orders." Undelivered orders are part of the gross obligations on line 1. However, they do not affect the net cost of operations. If an undelivered order is not accompanied by an advance, it does not affect the proprietary accounts at all (the mere ordering of goods and services or benefits to be provided is not recognized in the proprietary accounts, which require that the goods and services be received or the benefits be provided, either through accrual of payables or through actual payment, for recognition). If an advance accompanies the order, there *is* a proprietary effect, but not on the net cost of operations, which is the difference between expenses and exchange revenues. The advance which may accompany an undelivered order would be recorded in the proprietary accounts by increasing prepayments, and asset, and decreasing fund balance with Treasury, also an asset. No expenses or exchange revenues result from the transaction.

54. Thus, for a transaction involving the placing of an undelivered order of $100, line 1 would be $100 and line 30, the net cost of operations, would be zero. The reconciling

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

factor is the undelivered order, which would be shown as a negative amount on line 12. This would be the reporting for all increases in undelivered orders during the reporting period.

55. As discussed previously in this guide, the computation of obligations involves the change in undelivered orders over the reporting period. If that change were negative (i.e. if undelivered orders decreased over the reporting period), reverse signs would be required. If there was a $100 decrease in undelivered orders, then, based solely on that, line 1 would be -$100 and line 30 would still be $-0-. The reconciling figure would be placed as a positive amount on line 12.

56. **Line 13** is used to explain differences in resources and net cost of operations caused by expenses, which were accrued in previous periods but paid in the current period. Assume, for example, the following information about the annual leave liability, which Congress funds on a cash rather than an accrual basis:

A.	Beginning Balance	$1,000
B.	Leave Earned	200
C.	Leave Taken	250
D.	Ending Balance	$ 950

57. For this example, the budget would have recorded obligations of $250 for the leave taken. However, the annual leave expense would only be $200. Thus, line 1 would show $250, and line 30 would show $200. The difference is accounted for by the decrease in the annual leave balance, which is an example of “resources that finance expenses recognized in prior periods.” Here, the $250 payment financed all of the current year’s accrual, and $50 of accruals in prior years–recorded as expenses in those years. The decrease would be shown as a negative $50 placed on line 13.

58. Note that the $50 is theoretically the difference between data elements B and C in the list, but the arithmetic is such that the same amount can be determined by taking the difference between A and D. When C is greater than B, or, correspondingly, there is a decrease from A and D, the reconciling item is a negative amount placed on line 13. The treatment for situations in which there is an increase in the annual leave liability is not parallel. That situation is discussed in conjunction with line 19. This same reporting rationale would apply to any liability which Congress funds on a cash rather than an accrual basis.

59. **Line 14** either deals with offsetting collections that do not result in reductions of expenses or increases in exchange revenues. **Line 14a** is provided for credit program collections, which increase liabilities for loan guarantees (in a loan guarantee program) or increase the allowance for subsidy (in a direct loan program) placed against credit program assets to reduce them to their present value. The rules for credit program accounting involving direct loans or loan guarantees obligated after September 30, 1991, the implementation of “credit reform,” are such that certain collections which under pre-credit reform rules would be recorded as exchange

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

revenue are instead recorded as increases in the loan guarantee liability or allowance for subsidy.[30]

60. Assume that $10 in application fees is collected in a program under credit reform. That collection is recorded in the budgetary accounts as an offsetting collection, and would be included in line 2 of the statement of financing. Note that because line 2 is a subtraction line, the sign for the collection would be negative. Because the credit reform rules would require that the amount be used to increase the loan guarantee liability (in a loan guarantee program) or the allowance for subsidy (in a direct loan program), the net cost of operations would be unaffected. Hence, the statement of financing would show, solely for this transaction, -$10 on line 2 and zero on line 30. The reconciling factor of +$10 would be placed on line 14a. (See table below.)

61. **Line 14b** would be used for all other transactions which are recorded as offsetting collection activity but which do not affect the net cost of operations. One such transaction, involving unfilled customer orders, is relatively common and was discussed in paragraphs 18-20 of this guide. If there was an increase in unfilled customer orders of $10 that would appear as -$10 on line 2 and zero on line 30. The reconciling factor would be a +$10 on line 14b. (If it was material, a separate line should be shown for it rather than placing it on an "other" line. Generally, material items would be so displayed.) If there was a $10 decrease in unfilled customer orders, that would appear as a +$10 on line 2 and zero on line 30. The reconciling factor would be a -$10 placed on line 14b (or a specific line for unfilled customer orders). Remember that because line 2 is a subtraction line, an offsetting collection amount is shown as minus if it increased and plus if it decreased. (See table below.)

62. **Line 15** is used for acquisitions of assets–fixed assets, supplies inventory, merchandise inventory, and so forth. This was discussed on paragraph 36 of this guide. In the case of the $1,000 asset acquired in that example, line 1 would show the $1,000 if budgetary resources were obligated to obtain the asset, line 6 if the public donated the asset, or line 7 if it was transferred in from another federal agency without recourse. Line 30 would be zero, and the reconciling factor would be a -$1,000 reported on line 15. (See table below.)

	Application Fee	Unfilled Customer Orders	Asset Acquisition
Line 1			$ +1,000
Line 2	$ -10	$ -10/ +10	
Line 14a	+10		
Line 14b		+10/ -10	
Line 15			- 1,000
Line 30	$ 0	$ 0/ 0	$ 0

63. **Line 16** is for any other situation not covered in lines 12-15 which is a reconciling

30 SFFAS 2: *Accounting for Direct Loans and Loan Guarantees*, pars. 22-23, 37-38, and SFFAS No. 18, *Amendments to Accounting Standards for Direct Loans and Loan Guarantees* (May 2000), par. 10 and Appendix B.

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

item involving a resource which was not used to finance the net cost of operations. **Line 17** is the combination of lines 13-16, and **line 18**, while not in section 2 itself, is the combination of lines 17 and 11, or stated another way, is the difference between section 1 and section 2. Note that line 11 is the total resources used to finance activities; line 17 is the total resources used to finance items which *did not* finance the net cost of operations (i.e. did not result in an expense or an exchange revenue); and thus, line 18, the difference between 11 and 17, is the amount of resources which *did* finance the net cost of operations.

Components of the Net Cost of Operations Not Requiring or Generating Resources (Lines 19-29)

64. Figure 7 contains OMB's lines for the third section of the statement of financing, "components of the net cost of operations that will not require or generate resources in the current period." Remember that these components are expenses that do not require resources in the current period, and exchange revenues that do not generate resources in the current period. As discussed on paragraphs 39-44, these items may be divided into two broad categories, those that will require or generate resources in subsequent periods and those that will not. OMB has illustrated the former with lines 19-24, and the latter with lines 25-28.

Figure 7:
Expenses and Exchange Revenues Which Do Not Require or Use Resources During the Reporting Period

Components of the Net Cost of Operations that will not Require or Generate Resources in the Current Period:	
Components Requiring or Generating Resources in Future Periods:	
19. Increase in annual leave liability	xxx
20. Increase in environmental and disposal liability	xxx
21. Upward/Downward reestimates of credit subsidy expense (+/-)	xxx
22. Increase in exchange revenue receivable from the public	xxx
23. Other (+/-)	xxx
24. Total components of Net Cost of Operations that will require or generate resources in future periods	xxx
Components not Requiring or Generating Resources:	
25. Depreciation and amortization	xxx
26. Revaluation of assets or liabilities (+/-)	xxx
27. Other (+/-)	xxx
28. Total components of Net Cost of Operations that will not require or generate resources	xxx
29. *Total components of net cost of operations that will not require or generate resources in the current period*	x,xxx

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

65. **Line 19** is for expenses related to an increase in the liability. This situation was discussed in paragraphs 40-42, in which the annual leave liability increased by $10. The reporting would involve zero for resources and $10 for the net cost of operations. The reconciling factor would be a positive $10 on line 19. Note that a situation in which the annual leave liability decreases is handled through line 13. **Line 20** is exactly the same thing, except that the difference is caused by the liability for environmental disposal and cleanup rather than by the annual leave liability. Increases in the liability create a reconciling factor on line 20, and decreases on line 13.

66. **Line 21** is related to credit program accounting under the Credit Reform Act of 1990. The Act provides that agencies will get subsidies to cover defaults and other situations for direct loans and loan guarantees obligated after September 30, 1991. The amount of subsidy is re-estimated each year, and if more subsidy is needed than was provided, it is obtained from an appropriation in the next year. If less subsidy is needed than was provided previously, the excess amount must be deposited to a designated special or miscellaneous receipt in the Treasury in the next year. Because accrual accounting recognizes these adjustments in the year to which they are due, but budgetary accounting does not recognize them until the succeeding year, resources and the net cost of operations disconnect.

67. Suppose that in Year A, a credit-program agency estimates that its subsidy, including interest, was $100 too little–that is, an upward subsidy adjustment, or re-estimate, must be made. Because there will be no budgetary recognition until the following year, resources are zero. However, the net cost of operations contains the $100 of additional, accrued subsidy expense. Thus, line 11 would be zero, and line 30 would be $100. The reconciling factor is the subsidy expense, which would be placed as a positive amount on line 21.

68. The treatment for a downward re-estimate is parallel to that for an upward re-estimate. Suppose that instead, the agency had a downward subsidy re-estimate of $100. In that case, there would still be no budgetary effect, but expenses, and the net cost of operations, would have been *decreased* by the $100. Accordingly, line 11 would be zero, and line 30 would be -$100. The reconciling item is the downward re-estimate, and would be shown as -$100 on line 21.

69. There is an opposite effect in the subsequent year (Year B in the example), in which there is no further effect on the net income from collecting or paying the re-estimated amounts, but there is a budgetary effect. The treatment is not parallel, and is discussed in the final section of this guide, which covers the effect of selected additional transactions on the statement of financing.

70. **Line 22** is for increases in receivables for exchange revenue from the public over the reporting period. Absent specific legislation to the contrary, public receivables do not count as budgetary resources until they are collected. Hence, the revenue related to

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

accruals of those resources is not reflected in offsetting collection activity at the time they are accrued.[31]

71. Assume that the following data elements are compiled for interest receivable from the public in Year A.

A.	Beginning Balance	$100
B.	Interest Earned	25
C.	Interest Collected	20
D.	Ending Balance	$105

72. The budgetary transactions would include recognizing the $20 of interest collected as an offsetting collection, and hence line 2 of the statement of financing would be -$20 (remember that line 2 is a subtraction line, and hence the sign for the $20 of collections would be minus). The net cost of operations on line 30 would be -$25, however, recognizing the amount of interest earned on an accrual basis. This indicates that there is -$5 in net cost of operations that is not reflected in resources– i.e. that did not generate recognized budgetary resources. The -$5 would be placed on line 22. The reconciling item is the difference between B and C, and the arithmetic is such that it can also be computed by subtracting A from D, noting that the receivable increased.

73. The situation for a decrease in exchange revenue receivable from the public is not parallel. It is discussed in the final section of this guide, which covers the effect of selected additional transactions on the statement of financing.

74. **Line 23** is for all other expenses or exchange revenues that do not require or generate resources in the current period but will do so in a subsequent period. **Line 24** is the subtotal of lines 19-23.

75. **Line 25** is the first under the section “components [of the net cost of operations] not requiring or generating resources” [in the current or future periods]. It is for depreciation and its related component, amortization. Depreciation was discussed in paragraphs 43-44. In the example, total resources – line 11– would be zero, and the net cost of operations, line 30, would be $100. The reconciling factor is the depreciation expense, which would be placed as a positive amount on line 25. Depreciation expense will not use budgetary resources in the current or future periods, because the related resources were used to acquire the equipment – either through obligating budgetary resources or from public donations or transfers-in from other federal agencies without reimbursement.

76. Cost of goods sold and the expense for supplies used are additional examples of items, which fit into the category of this line. They are treated in exactly the same way, as is depreciation, because they relate to an expense for use of assets or the allocation of their cost over time, which does not use resources.

31 See paragraph 20 and OMB Bulletin 01-09, p. 41.

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

77. **Line 26** is for situations in which assets or liabilities are revalued, resulting in related expenses (losses) or exchange revenues (gains) that do not generate or use resources. Assume that an agency has $1,000 of capitalized property on its books, and that a physical inventory indicated that only $950 was accounted for. The resulting adjustment of $50 would decrease inventory and increase expenses (loss from theft, natural disaster, shrinkage, etc.). Thus, resources on line 11 would be zero and the net cost of operations on line 30 would be $50. The reconciling factor of $50 would be placed as a positive amount on line 26.

78. The treatment for a situation in which there was *more* property than expected is parallel. Assume that instead of a physical inventory indicating $950, it indicated $1,050 of merchandise on hand. In that case, the resources on line 11 would still be zero, but the net cost of operations on line 30 would be -$50, reflecting the gain. The reconciling factor would be -$50, and would be placed on line 26.

79. **Line 27** is for any expenses or exchange revenues that will not require or generate resources in the current or future periods that are not accounted for on lines 25 or 26, and **line 28** is the subtotal for lines 25 through 27. **Line 29** is the subtotal of lines 24 and 28.

Net Cost of Operations (Line 30)

80. The final line on the OMB Bulletin 01-09 illustration of the statement of financing is **Line 30**, which is the net cost of operations. This is computed by totaling line 29, the total components of net cost of operations that do not require or generate resources in the current period, and line 18, the total resources used to finance the net cost of operations. When these two lines are totaled, the result must be the net cost of operations, which must be the same amount as reported for that figure on line 10 of OMB's illustration for the statement of net cost and line 17 of its illustration of the statement of changes in net position.

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

V. ADDITIONAL ILLUSTRATIVE ITEMS

81. This section explains how the statement of financing handles some transactions not covered in the preceding section of this guide. They were not discussed previously because the OMB illustration did not provide specific lines for them or the transactions did not integrate well in the preceding section. The transactions are for:

- Upward and downward credit program subsidy expense adjustments in the year of collection or payment;
- Receipt of basic positive credit program subsidy or payment of negative subsidy;
- Amortization of the allowance for subsidy for the interest differential component of the subsidy;
- Obligations for Items that decrease liabilities for loan guarantees or allowances for subsidy;
- Scrapping, transfer-out, or sale of fixed assets;
- Decrease in exchange revenue receivable from the public;
- Accruing and collecting non-federal receivables for overpayments of expenses;
- Defaults (bad debts) expense; and
- Prior period adjustments.

These transactions were chosen because of questions frequently asked about them, and are not intended to be comprehensive.

Upward and Downward Credit Program Subsidy Expense Adjustments in the Year of Collection or Payment

82. Section IV covered upward and downward adjustments of credit-program subsidy expense in the year the adjustments were accrued. In the following year, when upward adjustments are collected and downward adjustments are paid to the special or miscellaneous receipt account involved, the budget recognizes the collection or payment, but there is no further effect on the net cost of operations, which already accrued the resulting increase or decrease in subsidy expense in the preceding year.

83. Assume that an agency accrued a $50 upward re-estimate of subsidy expense in Year A. In Year B, the agency would have its program account disburse the $50 to its financing account. A discussion of the nature of these accounts is beyond the scope of this guide; both accounts are components of the reporting entity. In Year B, the program account would obligate the $50, and the financing account would collect

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

it. Line 1 of the statement of financing illustrated by OMB would be $50, and line 2 would be-$50 for the obligation and collection, respectively, and thus the net obligated resources would be zero. Because the subsidy expense adjustment had already been accrued in the preceding year, the net cost of operations on line 30 would also be zero. Hence, there is no reconciling item required.

84. Assume instead that an agency accrued a $50 downward re-estimate of subsidy expense. In Year B, the agency would pay the money to a miscellaneous receipt account.[32] The financing account, which would make the payment, would record an obligation for the payment, which would appear as $50 on line 1 of the OMB statement of financing. The collection by the miscellaneous receipt account would appear as -$50 on line 4 of the statement as an offsetting receipt. Thus, the net obligated resources would be zero. Because the subsidy expense adjustment had already been accrued in the preceding year, the net cost of operations on line 30 would also be zero. Hence, there is no reconciling item required.

Receipt of Basic Positive Credit Program Subsidy or Payment of Negative Subsidy

85. A credit program financing account receives basic subsidy (as opposed to re-estimated subsidy) from the program account. The program account obligates resources and recognizes subsidy expense in the same amount as the obligation. The financing account records the offsetting collection from the program account, but increases the allowance for subsidy (a contra-asset) or the loan guarantee liability. Assume that a credit program's basic subsidy was $100. To report this, line 1 of the OMB illustration for the statement of financing would show the $100 obligation, and line 2 would show a -$100 for the offsetting collection, resulting in net resources of zero. The subsidy expense of $100 would result in net cost of operations in that amount on line 30.

86. The reconciling item is due to the fact that the collection resulted in an increase in a contra asset or a liability instead of a decrease in an expense or an increase in exchange revenue. The OMB illustration does not provide a specific line for that, and so line 14b, "other budgetary offsetting collections that do not affect net cost of operations," would be used to report the +$100 reconciling item. If the amount were material, the reporting entity would include a separate line in its statement of financing.

87. In summary, the statement of financing would report +$100 on line 1, -$100 on line 2, +$100 on line 14b, and +$100 on line 30.

88. Most federal credit programs receive subsidy, as in the preceding example. This may be called a "positive subsidy." However, in some credit programs the present value of cash inflows is more than the present value of cash outflows, so they have a negative subsidy. When such a program enters into transactions to issue direct

32 Most agencies would pay downward reestimates to a miscellaneous receipt account, but in special circumstances (such as mandatory programs) the downward reestimates could be paid to a program account, a special fund receipt account, or a liquidating account.

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

loans or to make loan guarantees, it must borrow the amount of the negative subsidy and deposit it to its designated miscellaneous receipt account (it will repay the borrowing from future cash collections related to the direct loans or loan guarantees).[33] The deposit is made in the same year that the profit–a negative subsidy expense–is recognized.

89. Assume that a federal credit agency has a $100 negative subsidy. The financing account will obligate the $100, and that will appear as +$100 on line 1. The agency will record the collection in the miscellaneous receipt account as an offsetting receipt of -$100 on line 4. Thus, net obligated resources are zero. The net cost of operations on line 30 would be -$100, reflecting negative subsidy expense in that amount.

90. The reconciling item is due to the fact that the obligation resulted in a net financing disbursement by the non-budgetary financing account and a transfer-out of a financing source rather than an expense. The OMB illustration does not provide a specific line for that, and so line 16, “other resources or adjustments to net obligated resources that do not affect net cost of operation” would be used to report the -$100 reconciling item. If the amount were material, a separate line just for that would be included by the agency in its statement of financing.

91. In summary, the statement of financing would report +$100 on line 1, -$100 on line 4, -$100 on line 16, and -$100 on line 30.

Amortization of the Allowance for Subsidy for the Interest Differential Component of the Subsidy

92. A common trait in many direct loan programs is a subsidy component required because the rate of interest charged borrowers is less than what the Treasury must pay to borrow money. The agency is paying a higher interest expense on its own borrowing from Treasury than the rate it is receiving from the borrower, such that the interest expense is higher than the interest income. Because the subsidy is designed to compensate the agency for this difference, an amount equal to the difference between the interest expense and income is amortized from the allowance for subsidy by decreasing the allowance for subsidy and increasing interest income. The budgetary accounts, which have already recognized the obligation and offsetting collection for subsidy expense, are not affected by the transaction.

93. Hence, resources on line 11 of the OMB illustration of the statement of financing are zero, and the net cost of operations on line 30 is the amount of the amortization. The reconciling item would be placed as one of the “depreciation and amortization items” on line 25, as a positive amount. If the amount were $10, then line 11 would be $-0-, line 25 would be +$10, and line 30 would be +$10.

33 Again, most agencies would pay downward reestimates to a miscellaneous receipt account, but in special circumstances (such as mandatory programs) the downward reestimates could be paid to a program account, a special fund receipt account, or a liquidating account.

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

94. It is possible, though more unusual, that the amortization is negative, meaning that the borrower is charged a greater rate than the government pays to obtain funds. The treatment for that is parallel to the treatment for positive amortization. Assume that there is negative subsidy amortization of $10 due to the interest differential. In that case, resources on line 11 are still $0, but the net cost of operations on line 30 is -$10 rather than +$10, because, as there has been more interest income from the borrowers than interest expense paid to the Treasury, interest income must be decreased by the amortization, increasing the net cost of operations. The reconciling factor of -$10 is placed on line 25.

Obligations for Items that Decrease Liabilities for Loan Guarantees or Allowances for Subsidy

95. Paragraphs 59 and 60 dealt with situations in which offsetting collections increased liabilities for loan guarantees or allowance for subsidy related to credit program assets. In those cases, budgetary resources were negative, and net costs of operations were zero. The reconciling item was the collection made.

96. A related situation occurs when obligations are placed that decrease liabilities for loan guarantees or allowance for subsidy. Assume, for example, that a $100 default claim is paid to a third-party lender because a guaranteed loan made by the lender defaults. An obligation placed for the $100 payment would appear on line 1. Because the transaction would decrease both the asset Fund Balance with Treasury and the loan guarantee liability, net cost of operations on line 30 would be zero. The Difference is explained by the default payment having been made. OMB Bulletin 01-09 does not have a separate line for this, and thus the reconciling item would appear on -$100 on line 16 in the model, for “other resources not financing the net cost of operations.” If it were material, a separate line with an appropriate caption would be used.

Scrapping, Transfer-out, or Sale of Fixed Assets

97. Sometimes an agency may scrap its fixed assets, transfer them to other agencies without reimbursement, or may sell them either for cost or at a gain or loss. Assume that an agency has a fixed asset with a book value of $100 and that it disposes of it under each of the following scenarios:

    1. Scrapping the asset.

    2. Transferring the asset to another agency without reimbursement

    3. Selling the asset for $100.

    4. Selling the asset for $110.

    5. Selling the asset for $85.

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

98. The treatment for each of these situations on the statement of financing is shown below, using key lines on the OMB Bulletin 01-09 illustration for the statement.

Line	**Scenario 1**	**Scenario 2**	**Scenario 3**	**Scenario 4**	**Scenario 5**
RESOURCES					
2. Offsetting Collections			-$100	-$110	-$85
7. Transfers-out		-$100			
11. Total Resources	**$-0-**	**-$100**	**-$100**	**-$110**	**-$85**
RESOURCES NOT FINANCING COSTS					
14b. Other Collections Not Affecting Costs			$100	$100	$85
16. Other Resources Not Financing Costs		$100			
EXPENSES NOT REQUIRING RESOURCES					
26. Revaluation of Assets	$100				$15
30. Net Cost of Operations	**$100**	**$-0-**	**$-0-**	**-$10**	**$15**

99. In scenario 1, there were no resources generated by the transaction. The net cost of operations was increased by the loss on disposal, and the reconciling item is that loss, which, resulting from a revaluation of assets from $100 to $-0-, is reported on line 26. (A separate line item for losses on asset disposals could be inserted if the amount was material.)

100. In scenario 2, the transfer out would have been reported on the statement of changes in net position and would have reduced financing sources that were not reported in the Budget (transfers in would be zero, and transfers-out would be $100, resulting in a net reduction of $100). Accordingly, the reduction would appear on line 7. The net cost of operations was zero, because the transfer-out is not an expense. The reconciling item is placed on line 16, an “other” line, because the OMB illustration does not have a specific line for it. A discrete line item could be added, if the item were material.

101. In scenario 3, the sale resulted in a collection, making the net resources -$100. However, the net cost of operations was zero, because the asset was sold for its book value. Since none of the $100 collection resulted in net cost of operations, the

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

reconciling item is on line 14b, an "other" line used because the OMB illustration does not provide a specific line. A specific line would be added if the amount were material.

102. Scenario 4 is similar to scenario 3, except that $10 of the $110 collection resulted in net cost of operations (a gain of $10, which yielded a negative net cost of operations in that amount). The other $100 was a reduction for the asset. Accordingly, the $100 reconciling item is placed on line 14b.

103. Scenario 5 is a bit more complicated, in that there are two reconciling items. The $85 is an offsetting collection, and appears on line 2, while the net cost of operations is $15, the amount of the loss on the sale. None of the $85 contributed exchange revenues to the net cost of operations, and hence a reconciling item in that amount is placed on line 14b. In addition, the $15 loss did not use resources, and hence a reconciling item in that amount is placed on line 26.

Decrease in Exchange Revenue Receivable from the Public

104. The discussion for line 22 in the previous main section of this guide dealt with an increase in exchange revenue receivable from the public over the reporting period. When the receivable decreases, the reporting is not parallel to that for an increase.

105. Assume that the following data elements are compiled for interest receivable from the public in Year A.

A.	Beginning Balance	$100
B.	Interest Earned	20
C.	Interest Collected	25
D.	Ending Balance	$ 95

106. The budgetary accounting will record the $25 of interest paid as an offsetting collection, and the proprietary accounting will result in interest revenue of $20. The collection will be reported as -$25 on line 2, while the net cost of operations on line 30 will be -$20. The difference of $5 is a collection that does not affect the net cost of operations, and would be reported as a reconciling item of +$5 on line 14b. The $5 can be computed as the difference between B and C or as the difference between A and D, noting that the receivable decreased.

Accruing and Collecting Non-federal Receivables for Overpayments of Expenses

107. Sometimes, agencies will accidentally overpay a vendor for expenses, and the amounts must be collected back. A receivable must be recorded in the proprietary accounts for the overpayment, and expenses are decreased accordingly. If the receivable is from the public rather than a federal entity, the budget will not recognize it as a resource until collected.[34] If collection is not made by the end of the year, net obligations will differ from net cost of operations.

34 See paragraph 20.

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

108. Assume that a $10 overpayment for expenses was made to a non-federal vendor, and a receivable from the vendor was accrued. As of the end of the year, the receivable had not been collected. In this case, resources on line 11 are zero, because the non-federal receivable cannot be recorded in the budgetary accounts. The net cost of operations on line 30 is -$10, because of the decrease in the expense. The OMB illustration of the statement of financing does not provide a specific line for this, and so line 23, "other components of the net cost of operations not requiring or generating resources" would be used to report the -$10 reconciling item. If it were material, a separate line would need to be created for it.

109. If collection of the $10 was then made in a subsequent year, offsetting collections on line 2 would be -$10, but the net cost of operations would be zero, because the expense had already been reduced in the previous year. Because none of the collection affected net cost of operations, the reconciling item would be on line 14b, "other collections that do not affect net cost of operations." If it were material, a separate line would need to be created for it.

Defaults Expense

110. Agencies may reduce their accounts receivable, or their pre-credit reform loans receivable to net realizable value by accruing defaults (bad debts) expense. They may also accrue an allowance for estimated loan guarantee losses on their pre-credit reform loan guarantees. Such accruals are not recognized in the Budget, because neither resources nor the status of resources is affected by the transaction. However, the amount of the expense is part of the net cost of operations.

111. Assume that an agency accrues $10 of defaults expense at the end of the year. Resources on line 11 are zero, and the net cost of operations on line 30 is $10. The OMB illustration does not have a specific line for the reconciling factor, which would be placed on line 27, "other expenses not requiring resources." If the amount was material, a special line could be inserted in the statement.

Prior Period Adjustments

112. "Prior period adjustments" (PPA) is a phrase with a technical meaning in proprietary accounting.[35] PPAs adjust the opening balance of cumulative results. The term does not have the same technical meaning in budgetary accounting. Thus, there is a difference between a PPA and an adjustment of prior-period obligations. A PPA could be made for any number of things, and may or may not have a budgetary impact; and, if there is a budgetary impact, it may or may not affect the statement of financing.

113. For example, with respect to undelivered orders, an upward adjustment of an

35 See SFFAS 21, *Reporting Corrections of Errors and Changes in Accounting Principles, Amending SFFAS No. 7,* Accounting for Revenue and Other Financing Sources.

This is the original Revised Implementation Guide to SFFAS 7; it has not been updated for subsequent changes to SFFAS 7. Please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

obligation in order to, for example, correct a recording error in a prior fiscal year would be a reconciling item on the current year's statement of financing [obligations increase, cost does not increase]. It would affect obligations but not the current year net cost of operations. Nor would it affect the prior year net cost of operations and, thus, it would not be a PPA in the proprietary system.

114. To illustrate, the following briefly discusses some possible situations involving upward or downward adjustments to receivables and liabilities:

a. *Non-federal receivables.* The budgetary system generally does not recognize non-federal receivables as resources, so an adjustment of a non-federal receivable would not affect net obligations. Hence, there would be nothing to report on the statement of financing, as net obligations and net cost of operations would both be zero.

b. *Federal receivables—upward adjustment.* An upward adjustment of a federal receivable, if not collected during the period, would appear as a negative item on line 2 of the statement of financing, and there would need to be a reconciling item between that and line 30, which would be zero. There is no specific line for that item in the OMB Bulletin 01-09 illustration, and so line 16 would be used. If material, a separate line just for the adjustment should appear. (If the receivable were collected in whole or part, the cash collection would also feed line 2.)

c. *Federal receivables—downward adjustment.* A downward adjustment of a federal receivable, if not collected during the year would appear as a positive item on line 2 of the statement of financing. The same reconciliation as described in "b," above, would need to be made. Any cash collections would also feed line 2.

d. *Unfunded liabilities.* Since by definition, the budget does not recognize obligations for unfunded liabilities, there would be nothing for the statement of financing to report if there was a prior period adjustment up or down, since both net obligations and net cost of operations would be zero.

e. *Funded liabilities—upward adjustment.* If a funded liability were adjusted upward, there would be an obligation placed, which would appear as a positive amount on line 1. Line 30 would be zero, and the reconciling item, the prior period adjustment, would appear on line 16 (a separate line with an appropriate caption would be used if the amount was material).

f. *Funded liabilities—downward adjustment.* Same as "e," except that the amount on line 1 would be negative.

This guide presents illustrations and explanations intended to help practice and understanding; it does not constitute authoritative standards for preparers and auditors of financial statements. Authoritative guidance on display (format) of financial reports prepared pursuant to the Chief Financial Officers Act of 1990 (as amended) is provided by the Office of Management and Budget (OMB) in its periodic bulletins on the form and content of agency financial statements. Further guidance on applying Statements of Federal Financial Accounting Standards (SFFAS) and interpretations of those standards may be requested from OMB, Office of Management and Budget, pursuant to OMB Circular 134, *Financial Accounting Principles and Standards* (May 20, 1993). Also, guidance on specific questions that arise in practice concerning the proper account(s) to use to record a given transaction may be sought from the Standard General Ledger Board.

IMPLEMENTATION GUIDE TO ACCOUNTING FOR REVENUE AND OTHER FINANCING SOURCES

TABLE OF CONTENTS

CHAPTER 1: REPORTING ON REVENUE AND OTHER FINANCING SOURCES 1
INTRODUCTION..... 1
OVERVIEW OF NEW FINANCIAL STATEMENTS..... 2
Statement of Net Cost (3); Statement of Custodial Activity (4); Statement of Changes in Net Position (5); Statement of Budgetary Resources (5); Statement of Financing (6)
HOW FINANCIAL STATEMENTS HAVE BEEN CHANGED..... 7
Changes to the Statement of Operations (7); Changes to the Balance Sheet (9); New Statements of Budgetary Resources and Financing (12)
TERMINOLOGY AND THE EVOLVING FEDERAL REPORTING MODEL..... 12
Disclosure (12); Required Supplementary Information (12); Required Supplementary Stewardship Information (13); Other Accompanying Information (13)

CHAPTER 2: NEW FINANCIAL STATEMENTS..... 16
STATEMENT OF NET COST..... 16
Rationale (16); Illustrative Statement of Net Cost (19); Attributing revenue to the costs of earning it (23); Implications for the display of special cases (26)
STATEMENT OF CUSTODIAL ACTIVITY..... 29
Rationale (29); Illustrative Statement of Custodial Activity (30)
STATEMENT OF CHANGES IN NET POSITION..... 31
Illustrative Statement of Changes in Net Position (32); Implications of the term "net results of operations" (32)
STATEMENT OF BUDGETARY RESOURCES..... 33
Rationale (33); Illustrative Statement of Budgetary Resources (34)
STATEMENT OF FINANCING..... 35
Rationale (35); Illustrative Statement of Financing (37); Preparing the Statement of Financing (37); Obligations and nonbudgetary resources (38); Resources that do not fund net cost of operations (39); Costs that do not require resources (40); Financing sources yet to be provided (41)
REPORTING REVENUE..... 42

CHAPTER 3: COMPARISON BETWEEN ACCOUNTING AND BUDGETARY CLASSIFICATIONS OF TRANSACTIONS..... 44
INTRODUCTION..... 44
TRANSACTIONS WITH THE PUBLIC..... 44
General comparison (44); User charges (47)
INTRAGOVERNMENTAL TRANSACTIONS..... 48
CHOICE OF CLASSIFICATION SYSTEM..... 49

APPENDIX: CIRCULAR A-134 105

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

CHAPTER 1: REPORTING ON REVENUE AND OTHER FINANCING SOURCES

INTRODUCTION

1. Statement of Federal Financial Accounting Standards Number 7, Accounting for Revenue and Other Financing Sources and Concepts for Reconciling Budgetary and Financial Accounting (SFFAS No. 7), provides authoritative standards for classifying, recognizing, and measuring inflows of resources to the U.S. Government and its component reporting entities. These standards help provide better information about the cost of the Government's activities, make Federal financial reporting more supportive of the budget and performance measurement, and demonstrate accountability. The standards reflect the concepts adopted in Statement of Federal Financial Accounting Concepts No. 1, Objectives of Federal Financial Reporting (SFFAC No. 1), and Statement of Federal Financial Accounting Concepts No. 2, Entity and Display (SFFAC No. 2).

2. This document is an implementation guide for SFFAS No. 7. It is not authoritative material. The guide presents illustrations, explanations, and a case study intended to help practice and understanding. Authoritative guidance on form and content (i.e., display) of financial reports prepared pursuant to the Chief Financial Officers Act of 1990 (as amended) is provided by OMB in its periodic bulletins on the form and content of agency financial statements. Further guidance on applying SFFAS No. 7 and interpretations of it and other Federal accounting standards may be requested from the Office of Federal Financial Management, Office of Management and Budget, pursuant to OMB Circular A-134, *Financial Accounting Principles and Standards* (May 20, 1993, or as subsequently amended).[1] Also, guidance on specific questions that arise in practice concerning the proper account(s) to use to record a given transaction may be sought from the Standard General Ledger Board.

[1] A-134 is reproduced in the Appendix to this Implementation Guide.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

3. FASAB prepared this implementation guide pursuant to Paragraph III.I, "Pronouncements," of FASAB's approved rules of procedure. Subparagraph 3 of paragraph III.I reads: "The FASAB may, in its discretion and with or without appointment of task forces, research, notice, public hearings, or public exposure, issue in its name or at its direction other communications of an informational nature related to Federal accounting and financial reporting, including the FASAB's mission, policies, and activities. Such communications may include, among others, discussion memorandums, summary and related documents, research reports, responses to requests and inquiries, and statements of policy dealing with matters of Federal accounting and financial reporting." Most of this Guide is a revision or expansion of parts of the material included in the exposure draft, Accounting for Revenue and Other Financing Sources (July 1995). It has been revised in light of the comments on that exposure draft.

4. This implementation guide is organized largely in terms of the new basic financial statements for component Federal reporting entities. The following new financial statements illustrate the application of the standards in SFFAS No. 7:

- Statement of Net Cost,
- Statement of Custodial Activity,
- Statement of Changes in Net Position,
- Statement of Budgetary Resources, and
- Statement of Financing.

5. Some accounting and disclosure issues peculiar to the consolidated financial statements of the U.S. Government (required by the Government Management Reform Act) have not yet been addressed by the Board. Those consolidated statements may differ from the statements of the component units described in this guide.

OVERVIEW OF NEW FINANCIAL STATEMENTS

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

6. The standards in SFFAS No. 7 contemplate that for each component reporting entity, all costs will be shown in a Statement of Net Cost, along with applicable exchange (i.e., earned) revenues. Another statement, the Statement of Changes in Net Position, will report nonexchange revenues and appropriations. Separating costs and exchange revenues from nonexchange revenues and other financing sources is necessary to calculate the net cost incurred by a reporting entity in providing its outputs and its contributions to outcomes.

Statement of Net Cost

7. Under the new accounting standards, exchange revenues will be deducted from gross costs on a Statement of Net Cost to show the net cost of the entity's operating activities. Gross cost consists of all the costs recognized by an entity for a given period under Federal accounting standards. Net cost is the amount for which the entity is responsible and may, with appropriate details or "breakdowns" by suborganizations and programs, be compared with the entity's outputs to evaluate its performance. Gross cost also is relevant to performance measurement and, for some purposes, is more useful than net cost. Net cost is also the amount that, with some exceptions, must ultimately be paid by the taxpayer. The only major exception is for intragovernmental sales of goods and services. The extent to which taxpayers bear the costs of these goods and services depends on whether the goods and services are sold to entities that in turn sell goods and services to the public, or to entities that are financed by taxes. The net cost of operations may also be financed by other nonexchange revenue such as fines and donations.

8. Details or breakdowns within the Statement will also show exchange revenues deducted from the related costs of the transactions that generated these revenues. This will show the extent to which the costs of goods and services sold to the public are recovered by exchange revenues. Exchange revenues will be included in the Statement of Net Cost regardless of whether the entity retains the amounts or transfers them to others.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Statement of Net Cost
Focuses on: Operating costs (gross costs) and related exchange revenues of the reporting entity Presents information about: All costs less earned revenues in total and by suborganizations and programs Emphasizes: Net cost of operations for comparison with performance measures

Statement of Custodial Activity

9. For reporting entities such as the Internal Revenue Service (IRS) that collect taxes for other entities, such custodial collections and the adjustments to measure revenue will be reported in statements that are separate from those used to report on the collecting entity's own operations. A Statement of Custodial Activity will reflect the collections by type, the adjustments to calculate the revenue, and the disposition of the amounts to the entities entitled to receive them. The collecting entities will not recognize inflows from these custodial activities as their own revenue.[2]

Statement of Custodial Activity
Focuses on: Revenue collections on behalf of other entities Presents information about: Source and disposition of collections and related accruals Emphasizes: Accountability for collections

[2]The IRS and the Customs Service now prepare a Statement of Custodial Activity.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Statement of Changes in Net Position

10. The Statement of Changes in Net Position provides a summary of all the entity's transactions that affect its net position. The net result of the entity's operations will be calculated by deducting from the net cost of operations the financing for that net cost. The financing is provided by nonexchange revenues, appropriations used, and other financing sources. To arrive at the change in net position during the period, adjustments will be made for any prior period adjustments and changes in unused but available appropriations.

Statement of Changes in Net Position
Focuses on: Financing sources for operations
Presents information about: All flow transactions of the entity
Emphasizes: The components of net results of operations and the change in net position

Statement of Budgetary Resources

11. The other financial statements do not provide information about the flow of budgetary resources on the budgetary basis of accounting. Information on that basis is used to control the obligation of budgetary resources and the outlays to liquidate those obligations. A Statement of Budgetary Resources will show this information and provide a reference point for the accrual-based financial statements. This Statement tracks the execution of the budget from the budgetary resources, to obligations of those budgetary resources, and finally to outlays (usually in cash) to satisfy obligations. Budgetary integrity will be enhanced because this Statement will be subject to audit.

Statement of Budgetary Resources
Focuses on: Budgetary resources provided, the status of these resources, and outlays

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Presents information about:
Budgetary data from budgetary resources, to obligation of funds, to outlays

Emphasizes:
Showing budget execution on a budget basis of accounting

Statement of Financing

12. Finally, a Statement of Financing will explain how the obligations incurred on a budget basis of accounting, together with nonbudgetary resources, finance the net cost of operations of the reporting entity. The Statement of Financing provides a reconciliation or "translation" from the budget to the financial statements. The Statement will help those who work with the budget to understand the financial statements and the cost information they provide.

Statement of Financing

Focuses on:
Reconciling budget obligations with net cost of operations

Presents information about:
Budgetary and nonbudgetary resources and the items which explain the differences between the budget basis and financial statement basis of accounting

Emphasizes:
Making financial information more comparable and useful

HOW FINANCIAL STATEMENTS HAVE BEEN CHANGED

13. Readers who know how Federal agencies have reported in the past may find it helpful to read this section, which illustrates how the new standards have changed reporting by Government component units.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Changes to the Statement of Operations

14. Past practice combined all costs, revenues, and other financing sources in a single Statement of Operations. Past practice did not recognize appropriations as a financing source when they were used to acquire assets, but it did accrue anticipated appropriations for incurred expenses. These practices often caused the bottom line in the old Statement of Operations to approximate zero.

15. The illustration on page 8 shows that applying the new standards will mean that the old Statement of Operations will be divided into separate statements. Costs and exchange revenues, on the one hand, will be shown in the new Statement of Net Cost, where they will determine the net cost of operations. Nonexchange revenue and other financing, on the other hand, will be shown in the new Statement of Changes in Net Position, where they will be deducted from the net cost of operations to determine the operating results. The operating results will be calculated in such a way that they will no longer often approximate zero as a matter of definition. This is because the appropriation will be recognized as used in the same period that budgetary accounting recognizes an expended appropriation. This will simplify accounting for appropriations. The Statement of Changes in Net Position will also show how the operating results and other adjustments determine the change in net position.

16. The figure on page 8 illustrates the changes described above, but does not show the interaction between the Statement of Custodial Activity and the Statement of Changes in Net Position (i.e., the flow of nonexchange revenues from the collecting entity's Statement of Custodial Activity to the recipient entity's Statement of Changes in Net Position).

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

STATEMENT OF OPERATIONS
(Old Format)

< Revenues

Appropriations used>

Less: Expenses>

STATEMENT OF CHANGES IN NET POSITION
(New)

> Net cost of operations

Appropriations used <

> Nonexchange revenues and other financing

Net result of operations

Prior period adjustments

Change in cumulative results of operations

Change in unexpended appropriations

Change in net position

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Changes to the Balance Sheet

17. The old Balance Sheet will be simplified. The flow effects of current capital transactions will be shown in the Statement of Changes in Net Position as illustrated at the bottom of the preceding page, and certain capital balances will be consolidated in the Balance Sheet. Previously, donations and transfers-in of assets without reimbursement were reflected directly in the Balance Sheet as additions to capital (i.e., without being reflected in operations). Also, appropriations used to acquire capital assets were reflected in the Balance Sheet as invested capital. They were not reflected in operations until the assets were depreciated. As a result, the current period effects of these transactions and events were obscured: only accumulated balances (i.e., stocks rather than flows) at the end of the accounting period were shown.

18. New accounting standards will govern accounting for unreimbursed asset transfers between Government entities, for donations, and for appropriations used. These standards will require that flows from the related transactions and events be separately recognized in the Statement of Changes in Net Position. The results of these flows will be combined with the results of other operating flows in one capital account, "cumulative results of operations." This standard and SFFAS No. 1's requirement for separate disclosure of current liabilities that are not covered by budgetary resources eliminate the need for the capital account for future funding requirements. These standards, together with OMB's form and content requirement that the Balance Sheet separately report liabilities that are covered by budgetary resources and those that are not covered, eliminate the need separately to report future funding requirements as a negative item in net position in the Balance Sheet. The only other capital account on the current Balance Sheet, "unexpended appropriations," will remain unchanged. Entities with reason to do so may continue to report this information separately within cumulative results of operations or as a disclosure.

19. Eliminating separate balances showing the accumulated amounts of invested capital, donations, and transfers from other Government entities will omit some information from the Balance Sheet. That information, however, is not

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

ordinarily used and, in the case of future financing, is misleading. It is misleading because it only represents amounts that were expensed, not items that were capitalized (such as assets under capital lease). Hence, looking at the unfunded liabilities (rather than the negative capital account for future funding requirements) gives a truer picture of the future budgetary resources needed for assets and expenses recognized in the proprietary financial statements of the reporting period.

20. The figure on the next page shows how the Balance Sheet will be condensed and how flow information in the Statement of Changes in Net Position affects related Balance Sheet elements.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. TERMINOLOGY AND THE EVOLVING FEDERAL REPORTING MODEL

22. "**Disclosure**" in this document indicates reporting information in notes or narrative regarded as an integral part of the basic financial statements. "**Supplementary**" indicates reporting information in schedules or narrative regarded as "Required Supplementary Information" (RSI) as that term is used by the Financial Accounting Standards Board (FASB) and the Governmental Accounting Standards Board (GASB) in accounting standards and by the General Accounting Office (GAO) and the American Institute of Certified Public Accountants (AICPA) in auditing standards. Government auditing standards (which incorporate the AICPA's standards by reference) require more limited auditing procedures for RSI than is required for basic information. "**Required Supplementary Stewardship Information**" (RSSI) is a new category unique to Federal Government accounting and auditing standards. It refers to certain information for which FASAB expects the GAO and OMB in collaboration to agree upon appropriate auditing procedures.[3] "**Other Accompanying Information**" (OAI) refers to unaudited information that accompanies the audited financial statements. These terms are intended to indicate the Board's expectations regarding the minimum auditor's responsibility for the information, not its placement in reports.

23. To provide a context for the new standard, the table on page 15 depicts the terms and categories used in accounting and auditing standards to define the auditor's normal degree of association and responsibility in connection with an examination of financial statements. The word "normal" acknowledges that the scope of any given engagement can be modified by the relevant authorities, e.g., by adding agreed-upon procedures to be performed on certain RSI or OAI.

24. Until such time as the GAO and OMB have defined the audit procedures for RSSI and Government Auditing Standards have been modified, the existing categories should be used. Operationally, similar field work results can be

[3]In its Statement of Recommended Accounting Standards, Supplementary Stewardship Reporting, FASAB recommends designating certain information as RSSI, with the expectation that OMB and GAO will in collaboration agree upon audit procedures appropriate to apply to this information.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

achieved under the existing standards by defining information as RSI or OAI as appropriate, with any additional desired agreed upon audit procedures specified by OMB in its instructions regarding audit of these financial statements. As is illustrated in the table on page 15, different reporting standards would apply under the proposed standards.

25. The new standard calls for certain information to accompany the financial statements as other accompanying information. This includes information about the revenue gap, a perspective on the income tax burden, and estimates of revenue forgone as a result of not charging full cost or market price for transactions with the public. The standard also recognizes that reporting entities may wish to present other accompanying information about other subjects, including directed flows of resources and tax expenditures related to programs for which the entities are responsible. This will mean that the auditor will treat this information as other accompanying information that is provided by the statement preparer but not required by a standards setter. Except as otherwise directed by the authority engaging for audit, or as may be subsequently directed by future developments in auditing and/or accounting standards, the auditor is not responsible for auditing this information. The auditor merely notes any material inconsistency between this information and the audited financial statements.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

CATEGORIES OF INFORMATION AND AUDITOR'S NORMAL ROLE IN CURRENT AND NEW STANDARDS

Basic Information	**Accompanying Information**	
Basic Financial Statements and Notes [highest level of audit work]	**Required Supplementary Information** (RSI) [limited audit procedures]	**Other Accompanying Information** (OAI) [not audited]
Fieldwork: The auditor examines the basic information and expresses an opinion whether it is fairly presented in accordance with relevant accounting standards. Each line in the statements, and each number in the statements and notes, is a separate "assertion" to be tested, but the auditor's tests are performed, and the auditor's opinion is expressed, in light of the auditor's judgment about materiality (whether a user's decision would be influenced). The judgment about materiality is influenced by the objectives of the financial statement or report and the uses contemplated for the information in it. **Reporting:** If basic information is missing or materially misstated the auditor expresses an adverse or "qualified" opinion (or, in some cases, disclaims an opinion).	**Fieldwork:** The auditor performs limited procedures specified by professional standards to review the RSI. These procedures are mainly inquiry and limited analytical procedures such as comparing information obtained for consistency with the auditor's knowledge and the evidence collected in connection with the examination of the basic information. **Reporting:** If RSI is missing or materially misstated, the auditor notes this, but may still express an unqualified opinion on the basic financial statements, if warranted.	**Fieldwork:** The auditor reads the other accompanying information to see whether it appears materially inconsistent with the financial statements, but does not audit the information. **Reporting:** The auditor notes any material inconsistency with the financial statements, but may still express an unqualified opinion on the basic financial statements, if warranted.
Required Supplementary Stewardship Information (RSSI): **Fieldwork:** to be defined by the GAO and OMB; varies for each item. **Reporting:** same as for "basic" information--i.e., auditor must qualify or disclaim if RSSI is missing or materially misstated.		

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

CHAPTER 2: NEW FINANCIAL STATEMENTS

STATEMENT OF NET COST

Rationale

26. The Statement of Net Cost is designed to explain and analyze the net cost of operations of an entity. The display of the information in this Statement reflects the thinking that underlies the standards in SFFAS No. 7 for distinguishing exchange revenue from nonexchange revenue and other financing sources, for recognizing exchange revenue, for matching exchange revenue with cost, and for assigning exchange revenue to the costs of earning it. The concept of this Statement is also discussed in SFFAC No. 2, ***Entity and Display***.[4]

27. The illustration of the Statement of Net Cost on page 19 expands upon the illustration in SFFAC No. 2, ***Entity and Display***. As explained in the introduction to this guide, the Statement of Net Cost shows separately the components of the net cost of the reporting entity's operations for the period. It consists of a display showing (1) the gross cost of the goods and services provided at a price, (2) the amount of related exchange revenue, (3) the resulting shortfall, or net cost,[5] (4) the gross cost of the goods, services, transfers, and grants not provided at a price (which comprise most of the Government's expenses), (5) the costs that cannot be assigned to specific outputs or programs, and (6) the exchange revenues that cannot be attributed to specific outputs or programs.

28. The costs in items (1), (4), and (5) of paragraph 0 are the gross costs of the reporting entity during the period and comprise all the costs recognized by the entity for a given period according to Federal accounting standards. The costs that cannot be assigned to outputs or programs consist of (a) high level general management and administrative support costs that cannot be directly traced, assigned on a cause-and effect-basis, or reasonably allocated to segments

[4]See pp. 31-34.

[5]The exchange revenue may be more than the gross cost, in which case the net cost is negative, i.e., the difference is a net revenue.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

and their outputs and (b) those "non-production costs" that cannot be assigned to a particular program (non-production costs are costs that, under Federal accounting standards, are linked to events other than the production of goods and services).[6]

29. The total net cost of operations of the reporting entity will be the net cost of all its outputs, whether or not provided at a price, plus the costs (and minus the exchange revenues) that are not assigned to outputs. The elements of the display on the Statement of Net Cost will be related to each other in a way that shows how the net cost of operations is determined for the reporting entity as a whole and its sub-organizations and programs.

30. Suborganizations are generally equivalent to responsibility segments, for which cost accounting is performed to measure and report the costs of the segment's outputs.[7] More than one suborganization may incur costs for a single program, as in cases where other suborganizations provide supporting services or goods without charge to the program. Net program cost equals the net cost of outputs plus any non-production costs that can be assigned to the program but not to its outputs.

31. The following example of a Statement of Net Cost illustrates some of the basic relationships that might be displayed, depending on the nature of the entity.

- Program A produces outputs that are entirely sold to the public.
- Program B produces outputs all of which are also sold, but some to the public and the rest to other Government entities.
- Programs C and D produce outputs that are not sold. Program C provides goods, services, transfers, or grants to the public; program D provides services to both the public and

[6]See SFFAS No. 4, *Managerial Cost Accounting Concepts and Standards for the Federal Government*, especially pp. 37-38 and 42, paragraphs 92 and 104.

[7]See *ibid.*, pp. 31-35. Also see SFFAC No. 2, *Entity and Display*, pp. 25-26, para. 75 and footnote 14.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

other Government entities.

o Program E produces two outputs for the public, of which one is sold and the other is not.

32. The net program cost is calculated separately for each program as gross costs less revenue earned, if any. Some of the programs illustrated in this Statement are carried out within a single suborganization, while others are not. If a program is carried out by more than one sub-organization, the net program cost is calculated both for each of these suborganizations separately and for all suborganizations together that are responsible for that program. All three sub-organizations in the illustration incur some general management and administrative support costs that cannot be assigned to programs and outputs and are thus reported as "costs not assigned to programs."[8] Suborganization C earns an insignificant amount of revenue that cannot be attributed to its outputs or programs and so is reported for the suborganization as a whole.

[8]SFFAS No. 4, *Managerial Cost Accounting Concepts and Standards for the Federal Government,* pp. 37-38, para. 92, defines such costs more fully and requires that they be reported in the entity's financial statements, such as the Statement of Net Cost, as costs not assigned to programs. Also see SFFAC No. 2, Entity and Display, pp. 33-34, para. 94-96.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Public	XXX	XXX	..	XXX
Program costs	XXX	XXX	..	XXX
Program E:				
Output 1:				
Public	XX	..	..	XX
Less earned revenues	X	..	..	X
Net cost of output 1	XX	..	..	XX
Output 2:				
Public	XXX	..	..	XXX
Net program costs	XXX	..	..	XXX
Costs not assigned to programs	XX	XX	XX	XX
Less other earned revenues not attributed to programs	..	..	X	X
Net Cost of Operations	$XXX	$XXX	$XXX	$XXX

33. Other variations on the Statement of Net Cost will also be appropriate depending on the types of programs that the reporting entity carries out and OMB's guidance on the form and content of agency financial statements. For example, a program that makes transfer payments to the public might differentiate these payments from its administrative costs because the transfer payments

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

are a measure of the benefits provided by the program:

Program F:	
Public:	
Transfer payments	XXX
Administrative costs	X
Program costs	XXX

34. Stewardship investment might also be differentiated: costs incurred for Federally financed physical property that is owned by state and local governments, for certain education and training, and for research and development. These costs have a distinctive importance because they are investments to increase economic growth and provide benefits to the nation over an extended period of time:[9]

Program G:	
Public:	
Costs for stewardship investment	XXX
Administrative costs	X
Other costs	X
Program costs	XXX

35. As another example, a program might incur non-production costs, which are costs linked to events other than the production of goods and services in the period when the costs were recognized. For example, the cost of acquiring weapons systems and other Federal mission property, plant, and equipment (PP&E) is recognized as a cost on the Statement of Net Cost when acquired, rather than through depreciation over the Federal mission property's estimated useful life.[10] Federal cost accounting does not assign non-production costs such as this to the goods and services produced in the period when the cost is recognized. Non-production costs might usefully be differentiated from other costs on the Statement of Net Cost in order to show and analyze separately those costs that were incurred during the reporting period for producing outputs in that period. For this reason, SFFAS No. 6, Accounting for Property, Plant, and

[9]See FASAB's Statement of Recommended Accounting Standards, *Supplementary Stewardship Reporting* (May 1996), pp. 5 and 31-43.

[10]SFFAS No. 6, Accounting for Property, Plant, and Equipment, p. 16, para. 53.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Equipment, requires that the cost of Federal mission PP&E, heritage assets, and stewardship land be separately disclosed, either on the face of the Statement of Net Cost or in footnotes, depending on the materiality of the amounts and the need to distinguish them from other costs relating to outputs and outcomes. In the case of weapons systems purchases, the distinction might be shown as follows:[11]

Program H:	
Weapons system purchases	XXX
Other costs	XXX
Program costs	XXX

36. If a program produces several large and distinct outputs, regardless of whether it earns any revenue, it may be illuminating to display the costs of each. If such a program has material non-production costs, they may be displayed separately from the production costs of the outputs:

Program I:	
Public:	
Output 1	XX
Output 2	XX
Non-production costs	X
Program costs	XX

[11]For further analysis of accounting for non-production costs, see ***SFFAS No. 4, Managerial Cost Accounting Concepts and Standards for the Federal Government***, especially para. 97, 103, and 104; and related discussion in SFFAS No. 4's Basis for Conclusions, para. 214-215. For the case of Federal mission PP&E, heritage assets, and stewardship land, see SFFAS No. 6, ***Accounting for Property, Plant, and Equipment***, para. 53, 61, and 69.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

37. As illustrated by these diverse possibilities, the Statement of Net Cost will emphasize information about the cost of operations. By this means, it will help achieve the objectives of Federal financial reporting and managerial cost accounting. Managers responsible for programs can often obtain cost information they need from internal cost reports and in other ways. Other users, however, depend partially or wholly on general purpose financial reports for cost information. These users include higher-level management of the entity, high-level Executive Branch officials and their staffs, and the Congress. They may need to refer to general purpose financial reports not only for the information contained in them but also to help them interpret the cost information they receive directly from management and to relate it to other information and events. Budget or program analysts, academic researchers, and members of the specialized news media and interest groups may depend even more on the information provided in an entity's general purpose financial reports. Members of the general news media and the public who wish to consult Government financial reports may rely entirely on general purpose financial reports. Even for program managers, the emphasis on net cost in this Statement and its use by others may contribute to a greater understanding of the concept and routine use of this information.

38. Good information on gross and net cost, determined and analyzed in the manner of this Statement, is essential to the success of the Government Performance and Results Act of 1993 (GPRA)[12] in relating costs to accomplishments. GPRA requires setting performance goals for program activity and establishing performance indicators to measure outputs and outcomes of the program activity. Performance measurement under GPRA is to begin in FY 1999, and pilot projects started in FY 1994. Under OMB's plan to carry out GPRA, performance reports will show the results of what was actually accomplished (outputs and outcomes) with the resources used. The net cost of programs (as well as gross cost) should be a fundamental measure of these resources.

[12]Public Law 103-62.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

39. Preparers should decide the exact classification of suborganizations and programs based on the nature of the entity, the missions and outputs for the entity's GPRA strategic and annual performance plans, the concepts in Entity and Display, Federal accounting standards, and OMB's bulletin prescribing the form and content of agency financial statements. OMB's guidance on the form and content of agency financial statements may require that the gross cost and net cost of operations be calculated by suborganization, program, and output, and reported separately in the Statement of Net Cost (or, if appropriate to reduce the complexity of the display, in footnotes to that Statement). Suborganizations are generally equivalent to responsibility segments as defined by the standards on managerial cost accounting.[13] Under the cost accounting standards, a responsibility segment must be able to assign full costs to the measurable outputs of its programs.[14] If reported on that basis, users of general purpose federal financial reports will be provided with the gross cost of the reporting entity's outputs (and outcomes).

40. When unit costs of outputs (and outcomes) are provided as performance indicators elsewhere in the report containing the financial statements, it may be useful to provide a reference to that information in the financial statements. A cross-reference in the financial statements does not change the level of audit otherwise specified for the performance information.

41. The information provided in the Statement of Net Cost generally will not be as detailed as the information needed by those who are responsible for budgeting and managing the costs of the Government, and by those who for other reasons have a special interest in the performance of a given program. The detailed information should be available through the managerial cost accounting system, cost analyses, and other studies used to provide the information reported in the Statement of Net Cost. However, the Statement of Net Cost

[14]SFFAS No. 4, *Managerial Cost Accounting Concepts and Standards for the Federal Government*, pp. 36-42 and 51-59.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

provides important summary information to top management, the central agencies, Congress, and the public. The Statement of Net Cost also provides a link to the more detailed information that may be used by managers of the reporting entity to explain the results shown in the Statement of Net Cost.

Attributing revenue to the costs of earning it

42. A reporting entity may have several missions carried out by different suborganizations, all of them having component programs and outputs. For each of these, both gross cost and net cost are important in evaluating performance and managing cost. Furthermore, either an entity as a whole or its suborganizations and programs may have significant costs that are not incurred to earn revenue, as well as significant costs that are incurred for that purpose. Therefore, the revenue-earning and nonrevenue-earning components need to be separately evaluated in order to assess the net cost of particular activities. Additionally, various components may earn revenue but cover costs to different degrees.

43. In all these cases, the net cost of the reporting entity as a whole does not show the extent to which earned revenue covers the cost of providing particular outputs. This can only be calculated for the entity's components. Determining the net cost for components is therefore essential to achieve the goals of SFFAS No. 7: to match exchange revenue with the gross cost of outputs and to offset exchange revenue against that related gross cost.

44. Exchange revenue should be attributed to the costs of outputs unless it is not reasonably possible to do so. If that cannot be done, exchange revenue should be attributed to the costs of programs, or, if that also is not reasonably possible, to the costs of suborganizations. Attributing exchange revenue to the components of an entity in this way is more effective for performance evaluation, price setting, and other purposes than attributing it to the reporting entity as a whole.

45. The following principles help determine the degree to which exchange revenue can reasonably be

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

attributed to a component of a reporting entity, a suborganization, or a program. Application of these principles requires the exercise of managerial judgment to meet the goal of measuring net cost for the many Government reporting entities with their varied characteristics.

45.1. Exchange revenue may be earned by an entity or program that sells all its goods or services in exchange for revenue. Examples include the Postal Service and the Defense Business Operations Fund. If the entity's gross costs are divided among programs or suborganizations that all sell goods or services, the exchange revenue attributable to these programs or suborganizations should be offset against the respective gross costs. If the entity is not so divided, its exchange revenue should be offset against the gross cost of the entity as a whole.

45.2. Exchange revenue may be attributable to an organization (or a program) as a whole in carrying out a function that is inherently governmental. For example, SEC registration fees may be deemed attributable to the SEC as a whole rather than to a division or line of activity within the SEC that manages the registration process. Such exchange revenue should be offset against the gross cost of the organization as a whole rather than the costs of the line of activity.

45.3. Exchange revenue may be earned by the operations of the entity as a whole in selling goods or services. For example, the National Park Service charges admission fees to parks and incurs expenses for such activities as preserving wildlife, maintaining roads, and providing visitor facilities. The fees are not related to the costs of the visitors as opposed to the costs of maintaining the land as a national heritage. They should be offset against the gross cost of the National Park Service.

45.4. Exchange revenue may be earned by a particular component of a reporting entity, such as a program within a suborganization. Except in the cases specified above, such exchange revenue should be offset against the gross cost of that component to calculate its net cost. The net cost of that component should be added to the net costs of other components to calculate the net cost of

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

the reporting entity as a whole.

45.5. Exchange revenue may be earned as a byproduct by some activities within a program or suborganization that are secondary to the main purpose of the program or suborganization. For example, the Geological Survey sells maps to the public as a byproduct of its surveys and other research. Such exchange revenue should be offset against the incremental costs incurred to produce that revenue, based on the assignment of costs according to the managerial cost accounting standards.[15] The other costs of the Geological Survey should be classified in other components of the organization.

45.6. Exchange revenue that is insignificant or cannot be associated with particular outputs may be deducted separately against the cost of the program, suborganization, or reporting entity as a whole.

46. Whether a particular revenue is offset against the cost of the reporting entity as a whole or against the cost of a component also depends on the level of aggregation of the reporting entity. As explained above, the admission fees of the National Park Service can reasonably be attributed to the National Park Service but not to its components. Therefore, in financial statements of the National Park Service, such revenue would most likely be offset against the gross cost of the reporting entity (the National Park Service) as a whole. However, the financial statements of the Department of the Interior might be divided by suborganization and include the National Park Service as one separate component. Because the admission fees would be reasonably attributed to the National Park Service, they would offset the gross cost of the component (the National Park Service) on the Department's Statement of Net Cost rather than the gross cost of the reporting entity (the Department) as a whole.

47. The effect of the level of aggregation could be even more pronounced where the exchange revenue is deducted from the gross costs of a program within a suborganization in the financial statements of the suborganization. In the

[15]For the standard on cost assignment, see ibid., pp. 51-59.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

financial statements of the full organization, the programs of the suborganization might be consolidated and the exchange revenue deducted from the gross cost of the suborganization as a whole.

Implications for the display of special cases

48. **Exchange revenue collected for others**. Many entities that collect exchange revenue keep that revenue for their own use. Revolving funds keep the revenue they earn. By their nature, they are expected to finance at least a significant part of their cost by selling goods and services in a continuing cycle of business-type activity. Other collecting entities may also keep the revenue they earn. Sometimes, however, the exchange revenue is transferred to the General Fund or to other entities in whole or in part. For example, the Southeastern and Southwestern Power Administrations transfer the revenue they collect from the public to the General Fund of the Treasury. Similarly, the Western Area Power Administration, while retaining some of the revenue that it collects, transfers the rest to the General Fund and various special funds designated by law.

49. As a general rule, exchange revenue transferred to others must be offset against the collecting entity's gross cost to determine its net cost of operations. Exchange revenue reduces the net cost of operations incurred by the entity in producing outputs, regardless of whether the entity keeps the exchange revenue for its own use or transfers it to another operating entity or the General Fund. Likewise, exchange revenue reduces the net cost of the entity's operations to the taxpayer regardless of its disposition. Therefore, all exchange revenue related to the cost of operations must be deducted from gross cost in the Statement of Net Cost to determine the net cost of operations for the entity. The display in that Statement has no need to distinguish between exchange revenue retained or transferred to others.

50. Exchange revenue that is transferred to others does not, however, affect the collecting entity's operating results and net position. Therefore, as required by the standards in SFFAS No. 7 for other financing sources, such exchange revenue is

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

recognized as a transfer-out in calculating the entity's operating results in its Statement of Changes in Net Position.

51. The only exception to the general rule occurs when the entity recognizes virtually no cost in earning the exchange revenue, as explained in the following section.

52. **Exchange revenue unrelated to recognized cost.** In exceptional cases, an entity may recognize virtually no costs in connection with earning exchange revenue that it collects. A major example for many years has been the Minerals Management Service (MMS) of the Department of the Interior. It manages energy and other mineral resources on the Outer Continental Shelf (OCS) and collects rents, royalties, and bonuses due the Government and Indian tribes from minerals produced on the OCS and other Federal and Indian lands. The rents, royalties, and bonuses are exchange revenues, earned by sales in the market. If the value of natural resources were recognized as an asset by MMS, then depletion could be recognized as a cost according to the units of production method as minerals were extracted.[16] The revenue from rents, royalties, and bonuses could then be matched against MMS's gross cost, including depletion and minor other costs, to determine its net cost of operations.

53. MMS does not recognize a depletion cost for various reasons, including the fact that under present accounting standards the value of natural resources is not recognized as an asset. As a result, this exchange revenue cannot be matched against the economic cost of operations and bears little relationship to the recognized cost of MMS. Therefore, it should not be subtracted from MMS's gross cost in determining its net cost of operations in its Statement of Net Cost. If it were subtracted, the relationship between MMS's net cost of operations and its measures of performance would be distorted. The net cost of operations of the Department of the Interior would likewise be distorted.

[16]Methods of calculating depletion based on the economic cost of extraction, such as represented here, should be distinguished from depletion methods allowed under the Internal Revenue Code.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

54. MMS collects this revenue acting as an agent for the recipients designated by law: the Treasury, certain entities within the Government to which amounts are earmarked, the states, and Indian tribes and allottees. Therefore, MMS should account for the exchange revenue as a custodial activity, which is an amount collected for others, in the same way as the Internal Revenue Service accounts for the nonexchange revenue that it collects. Because the revenue collected by MMS is exchange revenue, it should be recognized and measured under the exchange revenue standards when the rents, royalties, and bonuses are due pursuant to the contractual agreements. Custodial activity is reported in the entity's Statement of Custodial Activity.

55. The rents, royalties, and bonuses transferred to Treasury for the General Fund or to other Government reporting entities should be recognized similarly by these recipient entities. The revenue is exchange revenue and should be recognized and measured under the exchange revenue standards. However, although the revenue comes from exchange transactions, neither the Government as a whole nor the other recipient entities recognize the natural resources as an asset and depletion as a cost. Therefore, the revenue should not offset the cost of operations for the U.S. Government as a whole or for these entities and should not be included in their Statements of Net Cost. As in the case of MMS, offsetting cost by this revenue would distort the relationship between the net cost of operations and the measures of the performance of these entities. The exchange revenue should instead be a financing source in determining the operating results and changes in net position in their Statements of Changes in Net Position.

56. The Board is addressing the accounting for natural resources in a separate project. If it concludes that the value of mineral rights should be recognized as an asset and depletion as a cost, it would be appropriate to recognize the exchange revenue from rents, royalties, and bonuses in determining the net cost of operations.

57. Although MMS is the most prominent case of an entity collecting exchange revenue for which it recognizes virtually no cost, there can be other instances. The Federal Communications Commission

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

collects exchange revenue from the auction of the radio spectrum. Such revenue should be accounted for in the same way as the revenue collected by MMS.

STATEMENT OF CUSTODIAL ACTIVITY

Rationale

58. Entities that collect nonexchange revenue for the General Fund and other recipient entities do not recognize revenue as a result of collecting these resources. These entities are designated as "collecting entities" by SFFAS No. 7, which requires that the collection and disposition of nonexchange revenue be accounted for as custodial activity. The collection of exchange revenue is not a custodial activity, as a general rule, because exchange revenue should be deducted from gross cost in the Statement of Net Cost for the purpose of determining the net cost of operations. SFFAS No. 7 requires this accounting for exchange revenue regardless of whether the entity retains the exchange revenue for its own use or transfers it to others, except under exceptional circumstances stipulated in the standard and discussed in the previous section.

59. Collecting entities need to report their custodial activities in a way that highlights these important activities but does not obscure the entities' own operating costs. Therefore, significant transactions related to collecting revenue for others will be reported separately from the entity's reports on its own net cost and changes in net position. A statement designed to do that follows:

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Illustrative Statement of Custodial Activity

Sources of Revenue:	
Cash Collections: (by type of tax or duty)	$XX
Refunds and Other Payments	(X)
Net Collections	XX
Accrual Adjustment	X
Total Revenue	XX
Disposition of Revenue:	
Transferred to others: (by recipient)	XX
Increase (decrease) in amounts to be transferred	X
Retained by the Entity	X
Total Disposition of Revenue	XX
Net Custodial Activity	$-0-

60. Collecting entities are to report both cash and accrual information for taxes and duties they collect. Most of the Government's nonexchange revenues are derived from taxes and duties. Components of cash collections, by type of tax or duty, transfers to recipient entities, and the related accrual adjustments should normally be reported as illustrated above. Collections of nonexchange revenue other than taxes and duties may also be reported on a cash basis and adjusted to an accrual basis, but only the accrual basis information is required. The sources and disposition of revenue should net to zero.

61. The increases (or decreases) in the amounts of revenue to be transferred to other entities affect the inter-entity balances between the collecting entities and the entities that receive and recognize the revenue. Amounts may be retained by the collecting entities if they are entitled to the revenue. The collecting entities report such amounts in their Statement of Net Cost as an

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

exchange revenue if it is retained as a reimbursement of the costs of collection.

62. Based on the revenue standards in SFFAS No. 7, the net change in revenue-related assets and liabilities of the collecting entities is a component of revenue. The net change is referred to as the accrual adjustment. The accrual adjustment consists of accounts receivable, the allowance for uncollectible amounts, and accounts payable for refunds. Revenue recognized by the recipient entities is composed of the cash transferred to them and the increase or decrease in the amount to be transferred to them as measured by applicable cash collections and the accrual adjustment.

STATEMENT OF CHANGES IN NET POSITION

63. The Statement of Changes in Net Position is designed to show results of operations for the period and other adjustments to net position. The term "net results of operations" describes the excess (or the deficit) of the "net cost of operations" over "financing sources." These terms designate the first three sections in the Statement, as illustrated below. The net result of operations is also the current period's change in the cumulative results of the entity's operations since its inception, except to the extent that there are prior period adjustments. Prior period adjustments include corrections of errors and all changes in accounting principles.[17]

64. The Statement also shows budgetary resources from two accounting perspectives. First is the amount of appropriations used during the period. Together with other financing sources, "appropriations used" is deducted from net cost to show the net result of the entity's operations for the period. From the budgetary standpoint, appropriations include dedicated tax receipts, such as Social Security taxes and Highway Trust Fund excise taxes. From a proprietary standpoint, on the other hand, unexpended appropriations do not include dedicated tax receipts because these

[17]In the private sector, prior period adjustments are limited to corrections of errors and a few types of accounting principle changes. In addition, if comparative statements are presented, statements of prior periods are restated to reflect the retroactive application of the adjustment.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

receipts are accounted for as nonexchange revenue. Therefore, appropriations used would not include dedicated tax receipts, thus avoiding double counting of these amounts as financing sources.[18]

65. The second perspective on budgetary resources is the change in unexpended appropriations during the period. The Balance Sheet reports "unexpended appropriations" at the end of the current period as a separate element of net position. A simple illustration of the Statement of Changes in Net Position appears below. As was illustrated for the Statement of Net Cost, the Statement of Changes in Net Position might also be subdivided by suborganization.

Illustrative Statement of Changes in Net Position

Net Cost of Operations		$(XXX)
Financing Sources (other than exchange revenue):		
Appropriations used	XXX	
Taxes (nonexchange revenue)	X	
Donations (nonexchange revenue)		X
Imputed financing	X	
Transfers-in	X	
Transfers-out	(X)	
Net Results of Operations	X	
Prior Period Adjustments		X
Net Change in Cumulative Results of Operations	X	
Increase (Decrease) in Unexpended Appropriations	X	
Change in Net Position	X	
Net Position-Beginning of Period	XX	
Net Position-End of Period		$ XX

[18]For trust funds financed entirely by dedicated revenue and other dedicated financing sources, there are no "appropriations used."

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Implications of the term "net results of operations"

66. Some of those who commented on FASAB's exposure draft Accounting for Revenue and Other Financing Sources expressed concern that some readers might infer the amount of "net results of operations" was a significant performance measure, even though this will not be the case for most Federal reporting entities. Some users might draw such an inference because, in the private sector, the term "net results of operations" is synonymous with net income and net income is the "bottom line" performance measure. The Statement of Operations used by Federal reporting entities prior to implementation of SFFAS No. 7 focused on a similar bottom line, net results of operations. This was the effect of showing the flow of all operating activities on a single statement. For most Federal entities, however, no single bottom line can accurately measure performance, and "net results of operations" normally provides little information on either the costs or the benefits of an entity's operations. Therefore, the Statement of Changes in Net Position is not a performance-related Statement, and using the term "net results of operations" in this context does not imply that it is a measure of performance.

67. The Board notes that, when OMB revises its form and content guidance, OMB may wish to consider whether any change is needed in the captions for lines on the Statement of Changes in Net Position that are now labelled "Net Results of Operations" and "Net Change in Cumulative Results of Operations."

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. STATEMENT OF BUDGETARY RESOURCES

Rationale

68. The Statement of Budgetary Resources and the related disclosures provide information about how budgetary resources were made available as well as their status at the end of the period. This information is based on budgetary accounting rules. Because it is a basic financial statement, it also makes budget execution subject to audit at the level of the reporting entity. Some people are concerned about the accuracy of budget execution data at the budget account level. SFFAS No. 7 calls for that information to be presented for major budget accounts as RSI, which normally is subject only to limited review by auditors. When appropriate, this information could be made subject to more extensive agreed-upon audit procedures or attestation by OMB (through its bulletin on audits of Federal financial statements) or by Inspectors General or others who arrange for audits. Finally, the Statement of Budgetary Resources reports the "obligations incurred," which is also reported in the Statement of Financing and is the reference point for the reconciliation to the accrual-basis financial statements. An illustration of this statement follows:

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Illustrative Statement of Budgetary Resources

Budgetary resources:	
Budget authority (line 1)	$XXX
Unobligated balances-beginning of period (line 2A)	X
Spending authority from offsetting collections (line 3)	X
Adjustments (lines 4-6)	X
Total, budgetary resources	$XXX
Status of budgetary resources:	
Obligations incurred (line 8))	$XXX
Unobligated balances-end of period (line 9)	X
Unobligated balances-not available (line 10)	X
Total, status of budgetary resources (line 11)	$XXX
Outlays:	
Obligations incurred(line 8)	$XXX
Less: spending authority from offsetting collections and adjustments (lines 3A,B,D,&4A)	X
Obligated balance, net-begin. of period (line 12)	X
Obligated balance transferred, net (line 13)	X
Less: obligated balance, net-end of period (line 14)	X
Total, outlays (line 15)	$XXX

69. The terminology and definitions used in the Statement of Budgetary Resources are taken from the budget. OMB Circular A-34, Instructions on Budget Execution, dated December 26, 1995, defines the terms shown in this Statement. The above budgetary resources illustration differs from SFFAC No. 2, Entity and Display, to conform to the December 1995 revision of A-34. The revised SF-133 line item numbers are shown on the above illustration. If OMB concepts and definitions are revised in the future, the classification and recognition of the appropriate amounts should change accordingly. The U.S. Government Standard General Ledger (SGL) provides a crosswalk from the SGL accounts to reports on budget execution prepared for OMB. Those budget execution reports contain the information needed to prepare this Statement.

70. Disclosures are required if the information shown differs from that which is included in the "actual" column of the President's Budget. For

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

example, this disclosure would be needed in cases where the reporting entity in the financial statements is different than the reporting entity in the Budget.

71. Some users may be confused by budgetary terms being used in general purpose financial reports. As with all financial statements, footnotes are needed to make them understandable, especially when the financial statements use terms specific to a field of knowledge not necessarily known to a general user of the statements.

STATEMENT OF FINANCING

Rationale

72. A primary objective of the Board is that readers of the financial statements be able to understand the difference between obligations, as reported in the Federal budget and on the Statement of Budgetary Resources, and the net cost of operations reported in the Statement of Net Cost. Guidance prior to SFFAS No. 7 only reconciled expended authority with expenses. SFFAS No. 7 requires the more comprehensive reconciliation between obligations and net cost of operations.

73. "Net cost of operations" is the focal point of the Statement of Financing. The Board perceives information about gross and net cost to be the principal advantage that the financial statements offer both to those concerned with the budget and to those concerned with making performance measurement (as required under GPRA) successful. Therefore, budgetary obligations should be reconciled with net cost. By this comparison, financial reports can help those who make program authorization, modification, and discontinuation decisions.

74. Besides its value in reconciling budgetary and financial accounting, the Statement of Financing supplies information not shown elsewhere in the financial statements. It reports the net change in the amount of obligations for undelivered orders from the beginning to the end of the period, under the caption "Change in Amount of Goods, Services, and Benefits Ordered, but Not Yet Received or Provided." Under the caption "Financing Sources Yet to Be Provided," the Statement reports the

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

future budgetary funding requirements for transactions reflected in the net cost of operations for the period. Those amounts can be large, where substantial amounts of unfunded liabilities are recognized.

75. In addition to the information it provides, the Statement of Financing will provide additional assurance about the reliability of the system that produces the accounting and budgetary information. SFFAC No. 2, Entity and Display, does not illustrate the Statement of Financing but it is explained and illustrated in an amendment to SFFAC No. 2 published as part of SFFAS No. 7. An illustration follows:

Illustrative Statement of Financing

Obligations and Nonbudgetary Resources:	
Obligations incurred	$XXX
Less: Spending authority from offsetting collections and adjustments	X
Donations not in the budget	X
Financing imputed for cost subsidies	X
Transfers-in (out)	X
Exchange revenue not in the budget	(X)
Other	X
Obligations, as adjusted, and Nonbudgetary Resources	$XXX
Resources That Do Not Fund Net Cost of Operations:	
Change in amount of goods, services, and benefits ordered but not yet received or provided	(X)
Costs capitalized on the Balance Sheet	(X)
Financing sources that fund costs of prior periods	(X)
Other	(X)
Costs That Do Not Require Resources:	
Depreciation and amortization	X
Revaluations of assets and liabilities	X
Other	X
Financing Sources Yet to be Provided	X
Net Cost of Operations	$XXX

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Preparing the Statement of Financing

76. This comprehensive reconciliation can be accomplished by presenting the following information:

Net resources: obligations, as adjusted, and nonbudgetary resources

Resources not used to fund net cost of operations

Costs that do not require resources

Financing sources yet to be provided

These sets of information can be combined to yield the net cost of operations and, thereby, explain the differences between obligations and net cost of operations as shown above. The information is discussed in more detail below and is illustrated for specific transactions in chapters 4 and 5.

Obligations and nonbudgetary resources

77. The obligations and nonbudgetary resources section reports the computation of "Obligations Incurred" and its related budgetary adjustments. It also shows the items that provide financing but that are not recognized in the entity's budget.

78. Obligations include orders for goods and services which have not yet been filled (referred to as "undelivered orders,") and the value of goods and services received from orders which have been filled (referred to as "expended authority"). Budgetary adjustments to obligations are required (1) to subtract spending authority from offsetting collections (i.e., earned reimbursements, increases (decreases) in unfilled customer orders for work to be performed by the Federal reporting entity, and transfers from trust funds) and (2) to subtract recoveries of prior year obligations.

79. The sum of obligations and the adjustments to it represents the value of net budgetary resources obligated which could finance the net cost of operations. Additional financing sources could also finance net cost of operations. These would include such items as assets transferred in or out without reimbursement, most donations other than cash, and financing sources imputed for cost

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

subsidies. They must be added to the amount of obligations because they are nonbudgetary resources and, therefore, are not included in obligations.

80. Also, there may be exchange revenues which are nonbudgetary, e.g., an increase in accounts receivable from the public. (Intra-governmental accounts receivable are normally considered a budgetary resource, whereas accounts receivable from the public are not.) Any non-budgetary exchange revenues must be subtracted from obligations. This is because they were subtracted in the computation for net cost of operations, but were not included in the computation for obligations, as adjusted. Thus, an increase in accounts receivable from the public would be subtracted in the computation for net resources; a decrease would be added. Note that the amount of collections from the public is budgetary resources; hence the adjustment required is only for the change in revenues accrued as a receivable from the public.

81. The result of the above paragraphs 0-0 would be the net resources available to fund net cost of operations. This would be arrayed as shown below:

Obligations Incurred

Less Adjustments

Plus Nonbudgetary Resources Other than Exchange Revenue

Less Nonbudgetary Exchange Revenues

Equals Obligations, as Adjusted, and Nonbudgetary Resources

Resources that do not fund net cost of operations

82. Resources that do not fund net cost of operations for a reporting period commonly arise from three sources. One source is the change in goods, services, and benefits ordered but not yet received or provided. Another source is any good or service capitalized on the Balance Sheet. The third source is any item treated as a financing source yet to be provided in a prior period that is being recognized as a budgetary resource in the current period.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

83. The change in goods, services, and benefits ordered but not yet received or provided is the net change in undelivered orders from the beginning of the period to the end. The entity had to incur an obligation to place an order for goods or services, but accrual accounting does not recognize the transaction until the ordered goods, services, and benefits are actually received or provided. To reconcile obligations with the net cost of operations, net increases in undelivered orders should be subtracted from the net obligations and nonbudgetary resources; net decreases should be added. The entity's obligation to incur future costs is important information in and of itself, and therefore the total amount outstanding at the end of the reporting period is to be disclosed.

84. Goods and services received and capitalized as assets on the Balance Sheet should be subtracted from obligations and nonbudgetary resources. They require obligations but do not affect net cost. General property, plant, and equipment (PP&E) is the most obvious example. Other examples include loans made by liquidating funds under the Federal Credit Reform Act of 1990 (P.L. 101-508) and purchases of inventory.

85. An entity may receive budgetary resources in the current period that were previously reported as "financing sources yet to be provided," such as appropriations for credit subsidy reestimates recognized as expenses of the previous period, or for decreases in the liability for annual leave. Such amounts must be subtracted from obligations and nonbudgetary resources, because the current period budgetary financing funds costs (either expenses or capitalized items) that were recognized in previous periods.

Costs that do not require resources

86. Although there may be many expenses of this type, two of the most common are: (1) allocation of assets to expense, and (2) expenses related to revaluation of assets.

87. Cost is recognized in the Statement of Net Cost when cost of assets is allocated to expense. Depreciation of capitalized PP&E is an example of such allocation. Often the budgetary financing sources for the assets will have been recognized

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

during a prior period, when the capitalized items were acquired. Because the Statement of Financing is to report net cost of operations, the cost of assets allocated to expense must be added to obligations and nonbudgetary resources.

88. Changes during the accounting period in the valuation of assets (initially acquired by budgetary resources) may be made through accounting provisions or revaluations. When made, they are included in net cost of operations. Examples include:

- revaluation of PP&E due to obsolescence or damage, and
- revaluation of inventory for expected losses due to excess or unserviceable quantities, realization value lower than carrying value, etc.

89. It may not always be feasible to report separately the acquisition of certain assets, adjustments to them, and sales of them. For example, as a practical matter, a net decrease in inventory because of a combination of revaluations and sales that exceeded purchases may need to be aggregated in one amount under the caption, "Costs That Do Not Require Resources." This type of netting, though sometimes necessary, reduces the informative quality of the Statement of Financing.

Financing sources yet to be provided

90. The section of the Statement of Financing labeled "financing sources yet to be provided" reports the amount of obligations that will be made in future periods for costs recognized in the reporting period. It includes financing for all costs for which the Congress has not yet authorized the financing, or for which the Congress has authorized the financing but the amount has not yet been made available. This amount is added to the obligations and nonbudgetary resources of the reporting period because it represents a cost recognized in the Statement of Net Cost for the reporting period for which the financing sources will have to be provided in future periods. When financing is later made available, it is reported in the Statement of Financing as a subtraction from obligations and nonbudgetary resources in the

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

section entitled "resources that do not fund net cost of operations." It is also recognized as "appropriations used" and reported in the Statement of Changes in Net Position.

91. For agencies funded by appropriations, the most common example is the cost of increases in unused annual leave. Cost for this leave is incurred in the reporting period, but it is normally funded through salary and expense appropriations in subsequent years. The amount related to this increase in unused annual leave is reported as a financing source yet to be provided.

92. A further prominent example is the cost of subsidy reestimates for program funds under the Credit Reform Act. For financial reporting, subsidy reestimates are usually made as of the end of a fiscal year, and any increase in subsidy cost is recognized as an expense of that year. However, the reestimate cannot be calculated until after the end of the year, so the funding of that expense is not available until the following year. Thus, although the Congress has provided a permanent indefinite appropriation, it cannot be used until after the end of the fiscal year to which the reestimate applies.

93. In some instances, such as annual leave, funding for previously recognized costs may not be separately identifiable. Therefore, only the period change can be accounted for in the Statement of Financing. An increase in the unfunded liability would be shown as a financing source yet to be provided and a decrease would be shown as resources that do not fund net cost.

REPORTING REVENUE

94. The previous sections explained the different ways in which revenues are reported, depending on whether the revenue is exchange or nonexchange and on whether the collecting entity keeps the revenue or transfers it to others. The revenue may be reported on the Statement of Net Cost, the Statement of Custodial Activity, or the Statement of Changes in Net Position.

95. The following chart summarizes which statements to use. Note that exchange revenue, except for a few cases as noted earlier (see paragraphs 0-0), is always reported on the

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Statement of Net Cost and deducted from gross cost in calculating the entity's net cost of operations. If such revenue is transferred to others, it is also reported as a transfer-out in the Statement of Changes in Net Position.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

REVENUE REPORTING SUMMARY

DISPOSITION OF REVENUE	EXCHANGE REVENUE[19]	NONEXCHANGE REVENUE
Collecting entity keeps all	Statement of Net Cost	Statement of Changes in Net Position
Collecting entity transfers all to others	Full amount reported on Statement of Net Cost and also reported as a transfer-out on the Statement of Changes in Net Position	Full amounts collected and accrued, and their disposition, reported on Statement of Custodial Activity
Collecting entity keeps some and transfers some to others	Full amount reported on Statement of Net Cost and the amount transferred out reported on the Statement of Changes in Net Position	Full amounts collected and accrued, and their disposition (including amounts retained), reported on the Statement of Custodial Activity. Amounts retained also reported on Statement of Changes in Net Position unless they reimburse the collection function; then they are reported on the Statement of Net Cost as exchange revenue.

[19]See para. 0 - 0 for discussion of exceptional cases where exchange revenue is unrelated to recognized cost.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. CHAPTER 3: COMPARISON BETWEEN ACCOUNTING AND BUDGETARY CLASSIFICATIONS OF TRANSACTIONS

INTRODUCTION

96. This chapter compares the classification of transactions for financial accounting in SFFAS No. 7 with the classification of transactions used in the budget. The classification systems are very similar for transactions with the public, though significantly different in some respects for intragovernmental transactions. This chapter also compares the merits of having separate and common classification systems.

TRANSACTIONS WITH THE PUBLIC

97. **General comparison.** The distinction between nonexchange and exchange revenue is similar but not identical to the distinction in the budget between governmental receipts and offsetting collections from the public.[20] Governmental receipts are shown as the "receipts" in the budget and compared with outlays to calculate the deficit; whereas offsetting collections are subtracted from gross disbursements to determine the "outlays."[21] Nonexchange revenue generally corresponds to governmental receipts, and exchange revenue generally corresponds to offsetting collections. As a result, the

[20]The foundation of budget concepts for the distinction between governmental receipts and offsetting collections is the Report of the President's Commission on Budget Concepts (Washington, D.C.: U.S. Government Printing Office, October 1967), pp. 64-72.

[21]Offsetting collections are divided between two major categories: "offsetting collections credited to expenditure accounts," which are deducted in calculating the net outlays of the expenditure accounts in the budget to which they are credited; and "offsetting receipts," which are deposited in receipt accounts and in most cases are deducted in calculating net outlays at the agency level. (In a few cases, they are deducted in calculating government-wide net outlays.) In either case, they are an offset to total budget outlays. The difference between them, which is determined by law, is not germane to the issues in this chapter.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

budgetary classification and the accounting classification in SFFAS No. 7 are compatible with a few exceptions: gains and losses, budgetary inflows not recognized as revenue (such as exchanges of assets at book value), and inflows of resources recognized in financial accounting but not in the budget (such as non-cash donations). Also, there are a few instances where a particular inflow that is classified as a governmental receipt in the budget is classified as an exchange revenue in the financial accounting and hence subtracted from gross cost in the Statement of Net Cost.

98. The distinction in budgetary concepts between governmental receipts and offsetting collections is based on the difference in the method of allocating resources: collective decision making for governmental receipts and the market for offsetting collections. Governmental receipts are those collections derived from the exercise of the Government's sovereign powers, particularly its sovereign power to compel payment through taxation; whereas offsetting collections from the public are derived from business-type activities. The purpose of this system of classification is to measure the size of the Government, its agencies, and its functions in terms of the amount of resources allocated through collective political choice rather than through the principle that the provision of service requires the payment of a price. Under this classification system, the budget totals--total outlays and total receipts--measure what the U.S. Government does collectively in its role as a government, which is its predominant role, rather than what it does in its secondary role as a business.

99. Since nonexchange transactions, such as income tax receipts, would rarely occur except as a result of the Government's sovereign power, they are all governmental receipts in the budget. Exchange transactions are more varied. Exchange transactions with the public, such as the sale of maps and electricity, generally do not depend on sovereign power, so most are offsetting collections in the budget. However, there are three types of exceptions.

o Federal employee contributions to

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

retirement plans are exchange transactions because they are part of a broader exchange transaction--selling labor services in return for compensation--in which each party receives and sacrifices something of value. They are governmental receipts in the budget, however, because the budget classification deems them to be akin to compulsory social insurance taxes.

- Some transactions with the public that arise from the Government's sovereign power to regulate, such as passport fees and the SEC registration fee, are classified as exchange transactions for financial reporting. The entity's operations produce the revenue in conjunction with the expense; identifiable beneficiaries pay fees for the special services provided, or identifiable non-Federal entities pay fees to compensate the Government for the costs that were incurred in regulating them for the benefit of the general public; and the fees in general are closely related to the cost of providing service or regulation. Nevertheless, since the collections depend on the Government's sovereign power rather than being the result of voluntary transactions, these regulatory user fees are governmental receipts under budget concepts.

- Exchange transactions may produce a cash inflow all of which is included in the offsetting collections of the budget but only part of which is recognized in the financial accounting statements as an inflow of resources. Some exchange transactions produce gains or losses for the difference between cash inflow and book value instead of producing revenue for the whole amount of the cash inflow (such as the sale of property, plant, and equipment that has been capitalized). The entire amount of the cash collected is an offsetting collection in the budget, but only the gain or loss is recognized in the Statement of Net Cost. Other exchange transactions, such as the repayment of pre-1992 direct loans and other receivables at book value, are not included in revenue or other financing

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

sources at all, although (except for post-1991 direct loans) the entire amount of cash collected is an offsetting collection in the budget.[22]

100. **User charges.**[23] The term "user charge" designates payments that are based to a degree on related benefits or damages. Many are exchange transactions in the accounting classification of SFFAS No. 7 and are offsetting collections in the budget. Some, the regulatory user charges discussed above, are exchange transactions in the classification of SFFAS No. 7 but in concept are governmental receipts in the budget.

101. Still other user charges are benefit taxes or taxes related to the cause of some damage. Benefit taxes are levied on bases that are related to the use of publicly provided goods and services or the public provision of other benefits, such as the gasoline excise tax, which is largely dedicated to the highway trust fund. Taxes may also be levied on bases related to the cause of some damage and dedicated to pay for that damage, such as the tax on domestically mined coal, which is dedicated to the black lung disability trust fund. Because these are taxes, which depend on the Government's sovereign power to compel payment, they are governmental receipts in the budget. Because the relationship between the tax and the benefit received by an identifiable recipient is so indirect and disproportionate, these taxes are nonexchange transactions in the financial accounting.

102. The budget classification of user charges and other transactions is not clear-cut in every case. The nature of transactions may be mixed and contain elements of both voluntary exchange and sovereign power. For example,

[22]These repayments, however, may lead to an increase or decrease in expense if they are the occasion for reestimating the subsidy cost of post-1991 direct loans or for adjusting the allowance for uncollectible amounts of other receivables.

[23]User charges are discussed in a CBO study that has a broader scope than indicated by its title. See The Growth of Federal User Charges (August 1993). The data in that study have been updated in CBO Memorandum, The Growth of Federal User Charges: An Update (October 1995).

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

individuals under Medicare may choose to pay premiums for Supplemental Medical Insurance (SMI). At the same time, however, the Government, through its sovereign powers, pays for about three-quarters of the cost of SMI, which is such a strong incentive that almost all eligible persons participate. As a result, the premiums might reasonably be classified as either governmental receipts or offsetting collections. They were classified as governmental receipts when the program began but for some years have been classified as offsetting collections.

103. Furthermore, the budget classification of various user charges does not follow the conceptual principles in every instance. Statutory requirements and other public policies have increasingly classified regulatory user charges as offsetting collections in recent years even though they arise from the exercise of the Government's sovereign power.[24] The budget classification of receipts now has a formal category of "offsetting governmental receipts" that includes a number of transactions that are deemed to arise from sovereign power but are classified as offsetting receipts; and the budget identifies as "governmental" those offsetting collections credited to expenditure accounts that arise from sovereign power.[25]

[24]CBO, The Growth of Federal User Charges (August 1993), pp. 35-36.

[25]Governmental offsetting collections credited to an expenditure account are identified as such and shown on a separate line in the account's program and financing schedule.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

INTRAGOVERNMENTAL TRANSACTIONS

104. The relationship between budgetary and financial accounting transactions is not nearly as close for intragovernmental transactions as it is for transactions with the public. All intragovernmental collections recorded in the budget are offsetting collections. This is necessary in order that the receipt and outlay totals of the budget reflect only transactions with the public. However, as explained in Appendix B of SFFAS No. 7, some of these offsetting collections are exchange revenues in the new financial accounting, a few are nonexchange revenues, while a number of others are classified as other financing sources. Furthermore, the financial accounting recognizes some inflows of resources that are not transactions in the budget.

105. Intragovernmental exchange transactions consist of all payments for goods and services provided, such as the sale of services by DBOF (Defense Business Operations Fund) to another entity within the Department of Defense. Intragovernmental nonexchange transactions are those transactions where the inflow of resources is akin to a corresponding nonexchange transaction with the public (such as an employer entity's contributions to Social Security and Medicare for its employees) or derives directly from past nonexchange transactions with the public (such as interest paid to trust funds on their investments in Treasury securities that they purchased from previous tax receipts).

106. Other intragovernmental financing sources are more varied. They include many inflows of resources that are not recorded as transactions in the budget. The most important of these is appropriations, which are recognized as an other financing source to the entity when used but are not recorded in the calculation of budget outlays and receipts. The budget records appropriations, of course, but appropriations provide the authority to enter into obligations that will result in outlays rather than being offsets in calculating the amount of outlays. Recording appropriations as offsetting collections would make outlays approximately zero when appropriations were subtracted from

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

the outlays for which they provided the authority. Further examples of other financing sources are the transfer of capitalized assets without reimbursement, and imputed financing when the full cost of goods or services is recognized but is not charged to the entity that receives them. The other intragovernmental financing sources all have the same basic characteristic: they are not produced by the operations of the entity that receives the inflow and therefore should not be deducted from its gross cost in determining its net cost of operations.

CHOICE OF CLASSIFICATION SYSTEM

107. Because financial and budgetary accounting are related, it may be asked whether financial accounting should follow the budgetary classification of transactions. For intra-governmental transactions, the differences are so large and fundamental between budgetary accounting and the principles in SFFAS No. 7 that the two classifications could not reasonably be made the same.

- The accounting principles of SFFAS No. 7 require that exchange revenue be recognized separately from nonexchange revenue and other financing sources and offset against gross cost in order to calculate net cost. Nonexchange revenue and other financing sources do not affect net cost but do contribute to net position. The budget classification of intragovernmental offsetting collections does not make this distinction and must offset all intragovernmental transactions against gross outlays in order for the budget totals to measure transactions with the public.

- The inflows of resources classified by financial accounting as other financing sources--such as appropriations--could not be classified as offsetting collections in the budget without making the related budget outlays approximately zero as a matter of definition. However, they are necessary in financial accounting to determine the change in net position.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

108. For transactions with the public, on the other hand, the differences between the principles of SFFAS No. 7 and the budgetary classification are relatively small. There are about $5 billion of employee contributions to Federal retirement systems that are classified as exchange transactions for financial accounting but are governmental receipts in the budget, and there are around $2 billion of regulatory user fees that are classified in the same way. There are also sales of property, plant, and equipment, which are recognized in financial accounting only to the extent of a gain or loss but are measured by cash inflow in the budget. These and similar transactions are relatively small compared to the $1,570 billion of governmental receipts plus offsetting collections (from the public) recorded in the budget for 1995.

109. Financial accounting could follow the budget in classifying the type of transaction with the public by matching exchange revenue with offsetting collections and nonexchange revenue with governmental receipts. The arguments are fourfold. First, one classification system is simpler to use and understand than two systems and would avoid confusion. Second, the two classifications generally overlap, as discussed above, so the aggregate loss from misclassification in terms of the financial reporting criteria could not be large. Third, in some cases the transactions for which the two classifications differ are borderline decisions under both classifications, especially in the area of regulatory user charges. And fourth, a separate classification system would need its own method of ensuring compliance.

110. The underlying argument in favor of separate classifications is that different classification systems are needed for different purposes. The primary purpose of the classification system for revenue and other financing sources is to help measure the net cost of an entity's operations. To achieve this result, it is necessary to offset the entity's costs by the revenue that it earns from the provision of goods and services.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

111. The net cost of operations is important information. For all entities, the net cost (and the gross cost) should be compared with outputs and outcomes in assessing the effectiveness with which resources are used to achieve results. For an entity that provides goods and services to the taxpayer, net cost is needed in order to calculate the extent to which the cost of the activity is borne by the taxpayer rather than by identifiable recipients of special benefits or by identifiable parties that are being regulated. This information can help decision makers evaluate the extent to which the entity's exchange activities were justified in terms of the public's willingness to pay. Both the comparison of costs with outputs and outcomes, and the information about the public's willingness to pay, can be used by management, the President, and the Congress in making decisions about the allocation of resources. And for all entities that provide goods and services, whether to the public or to other Federal entities, the net cost of operations is needed in evaluating and establishing the entity's pricing policy. The extent to which expense is covered by user charges can be a critical factor in setting user changes that are efficient and fair.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

112. Although a separate classification system for transactions with the public would make little difference to the aggregate amounts in the consolidated financial statements of the U.S. Government, it would enable these particular goals to be much better met for a number of specific entities and activities: instances where the budget does not offset program outlays by the collections earned by the program's provision of goods and services, or where the budget records an offsetting collection that exceeds the gain/loss or adjustment to expense. Furthermore, as long as the financial accounting standards measure some transactions in terms of the difference between the cash inflow and the book value of the assets that are given up, the dollar amounts of a few types of transactions cannot be the same. The financial accounting standards, moreover, recognize a few transactions with the public that are not recorded in the budget. Nor can the financial accounting classification be compatible in all cases with both budget concepts and budget practice. Finally, the classification of intragovernmental transactions would remain very different, so the two systems would still not be identical.

113. Because the purposes of financial accounting and the budget are different, although related, it is reasonable to expect that the classification systems appropriate for each purpose would also be related but not identical. This would be similar to the relationship between the Federal budget and the Federal sector in the national income and product accounts. Their principal purposes differ, and as a result their classifications have important differences even while being similar in many respects.[26] Accordingly, the

[26]The difference between the classifications in the budget and the national income and product accounts prior to the comprehensive revision of these accounts in January 1996 is discussed in "National Income and Product Accounts," chapter 19 of Analytical Perspectives, Budget of the United States Government, Fiscal Year 1996, pp. 267-70. For a more detailed reconciliation table, see Bureau of Economic Analysis, National Income and Product Accounts of the United States, vol. 2, 1959-88 (Washington: Government Printing Office, 1992), table 3.18B.

Board decided to recommend that financial accounting use a separate classification system from the budget.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. CHAPTER 4: CASE STUDY AND ILLUSTRATIONS

114. This is a case study to illustrate the application of the new standard on accounting for revenue and other financing sources. The case provides a set of budgetary and proprietary journal entries and related proprietary financial statements for three Federal entities that have transactions with each other and with the public. The entities are:

a. a *collecting entity*, which receives an annual appropriation and collects tax revenues earmarked for a trust fund;

b. a *credit program entity*, which makes loans, provides reimbursable services to the trust fund, and procures services from the public;

c. a *trust fund*, which consolidates the cash and investing activities of Treasury's Financial Management Service with the activities of the program agency administering the trust fund's operations.

115. The case illustrates the following transactions in the appropriate entities:

a. collection, accrual, and transfer of taxes;

b. ordering goods or services to be received or provided;

c. issuance and receipt of appropriations and borrowings from Treasury;

d. interagency borrowing from Treasury;

e. receipt or provision of goods, services, and benefits, including making loans to the public;

f. collection of loan principal and interest;

g. interagency purchase, issuance, and redemption of Treasury securities;

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

h. accrual, payment, and receipt of interest on the Treasury securities;

i. imputation of revenue and expense for services provided at less than cost;

j. depreciation of equipment and accrual of annual leave;

k. temporary accrual of financing sources for expenses to be funded from future financing sources;

l. closing entries.

116. Both pre- and post-closing trial balances are shown for the budgetary and proprietary accounts for each entity. From these, the following financial statements are illustrated based on the requirements of the new standard:

a. Statement of Custodial Activity;

b. Statement of Net Cost;

c. Statement of Changes in Net Position;

d. Balance Sheet;

e. Statement of Budgetary Resources; and

f. Statement of Financing.

117. Only the line items necessary to complete the statements are shown. Crosswalks to account balances from which the figures are obtained are presented on the face of the statement for illustrative purposes.

118. There are a number of caveats in using the case.

a. The case entities do not reflect any particular Federal agencies or programs. Although there are counterparts to the illustrated transactions in real Federal agencies and programs, the case entities and their transactions are fictitious. Dollar amounts used in transactions are assumed for purposes of illustration. Particularly, regarding the credit agency, in an actual

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

situation the amounts relating to the subsidy and its amortization would be computed using present value methodologies, which are beyond the scope of this implementation guide. Information on present value computations for direct loan and loan guarantee programs is provided in the reference set forth in paragraph 119(h). Additional information is also found in Appendix B, "Technical Explanations and Illustrations," of SFFAS No. 2, Accounting for Direct Loans and Loan Guarantees (August 23, 1993).

b. The transactions are illustrative, but not comprehensive. Federal agencies engage in many transactions in addition to those shown, such as the use and recognition of contract authority and sales of assets, decreases in the liability for annual leave, accrual of exchange revenue from the public, etc. A comprehensive case would mask the benefit of the illustrations by requiring voluminous technical and explanatory information about specific programs and transactions. Similarly, the reports and crosswalks illustrated are condensed and simplified to highlight application of key concepts and requirements of the revenue standard. Authoritative guidance for agency financial statements that are prepared pursuant to the Chief Financial Officers Act (as amended) is contained in OMB's bulletin on form and content. Guidance for budgetary reports is contained in OMB Circulars A-11 and A-34. Agencies may sometimes develop alternative crosswalks which provide the same information.

c. The journal entries and trial balances for the collecting agency and trust fund utilize accounts provided in the U. S. Government Standard General Ledger, and the illustrated reports include crosswalks to those accounts. Account names are often abbreviated to fit within available space. At this writing, the SGL Board is revising the illustrative transactions in the SGL, and journal entries are subject to change.

d. Accounts which would be subaccounts of an SGL account are shown with the master account number. For example, account number 6100,

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

"Operating/Program Expenses," is used for the subaccount "Depreciation Expense - Equipment." Subaccount titles and numbers are the purview of agencies.

e. Line items which would be reported based on data elements being captured with accounts are indicated with a "D." For example, account 6100, "Operating Expenses," would require data elements for each expense to indicate whether the expense was exchange- or nonexchange-related.

f. Accounts not presently in the SGL are marked "XXXX" in place of a number, and the issues involved have been referred to the SGL Board for resolution.

g. Crosswalks are those for SGL accounts used in the case only. They do not include the entire SGL chart of accounts.

h. Beginning account balances are assumed to be zero for purposes of illustration.

i. For simplicity, all appropriations are classified as "other," SGL account 4119, rather than as specific types of appropriations. In an actual situation, specific types of appropriations, with different SGL account numbers, would be designated as applicable. Budgetary authority for the collecting and credit agencies is assumed to expire at year-end; authority for the trust fund is assumed to be available for obligation in the succeeding year. Additionally, apportionment of resources is assumed and not illustrated. The status of resources is shown beginning with their allotment by agencies for commitment and obligation. Commitment accounting, which does not add to the value of the case, is not illustrated.

j. In most cases, revenues and expenses are not broken out beyond the designation "exchange" and "nonexchange." This is for illustrative purposes only and is designed to avoid cluttering the statements with specific items

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

which do not add to the value of the concepts presented. Note, however, that in an actual situation, revenues and expenses must be broken out by source of revenue and nature of expense as prescribed by OMB's form and content guidance.

k. The trust fund transactions provide for transfers of collections to it in the amount collected. In practice, transfers are made during the year based on estimates, and any amount collected but not yet transferred at year-end is accrued as a receivable and a revenue by the trust fund.

l. In addition to activities for the entities illustrated, the Department of the Treasury would maintain records on the Government's cash position and debt. Related information would be reported in the Consolidated Financial Statements of the U. S. Government.

m. The illustrative Balance Sheets are designed solely to highlight the new, simplified capital structure which would result from application of the revenue standard. Assets and liabilities are not segregated by entity and non-entity to avoid complicating the example with items not related to the revenue standard. Agency Balance Sheets would be prepared in accordance with SFFAS No. 1 and the form and content guidance published by OMB, which prescribes the entity and non-entity designations.

119. More detailed information on Federal accounting can be found in such references as:

121. a. The following pages present financial statements for the three entities involved. The matrix below identifies the statements prepared for each entity.

ILLUSTRATIVE FINANCIAL STATEMENTS PREPARED FOR CASE STUDY ENTITIES

Statement	Collecting Agency	Credit Agency	Trust Fund
Custodial Activity	Figure 1	N/A	N/A
Net Cost	Figure 2	Figure 7	Figure 12
Changes in Net Position	Figure 3	Figure 8	Figure 13
Balance Sheet	Figure 4	Figure 9	Figure 14
Budgetary Resources	Figure 5	Figure 10	Figure 15
Financing	Figure 6	Figure 11	Figure 16

b. The legend for the various statements is as follows:

1. [ ] designates accounts and arithmetic
2. XXXX designates an account not in the SGL
3. B = beginning account balance
4. E = ending account balance
5. No B or E = adjusted (preclosing) account balance
6. Pub = public (outside the Government)
7. Fed = Federal (within the Government)

CHAPTER 5: ADDITIONAL GUIDANCE FOR PREPARING THE STATEMENT OF FINANCING

INTRODUCTION

122. Chapter 4 illustrated the results of numerous typical transactions for the financial statements in SFFAC No. 2, Entity and Display, as amended by SFFAS No. 7 to include the Statement of Financing. It was not feasible to include every possible transaction or to illustrate every possible circumstance.

123. Most of the financial statements in Entity and Display are based on concepts for the same financial statements that existed previously. Even the Statement of Budgetary Resources was based on the SF-133, "Report on Budget Execution," required of agencies by OMB. However, the Statement of Financing, introduced in SFFAS No. 7, is relatively new. While reconciliations between expended authority and expenses have been required before, there has not been a requirement to reconcile gross obligations with net cost of operations.

124. Because of the newness of the Statement, this chapter provides additional information about the Statement of Financing by showing how certain additional transactions should be reported. They include:

a. a decrease in the annual leave liability from the beginning to the end of the year;

b. acquisition of assets under capital leases;

c. transfer of assets in and out without reimbursement;

d. sale of property, plant, and equipment at a gain, loss, or neither;

e. accrual of revenue which is not recognized as a budgetary resource;

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

f. special topics related to discretionary direct loan and loan guarantee programs.

125. Whereas chapter 4 presented journal entries and trial balances for the results of the transactions covered, this chapter deals with individual transactions only. Journal entries and trial balances leading to the transaction are not included. The U.S. Government Standard General Ledger illustrates transactions for agencies and includes crosswalks to reports, and the Standard General Ledger Board provides a forum for discussing issues related to recording and reporting.

126. For each of the five transaction types, this chapter describes the transactions and illustrates reporting on the Statement of Financing. The transactions are not intended to be comprehensive, but rather are particular issues raised during a pilot test of the Statement of Financing and in other comments from agencies. As with chapter 4, small dollar amounts are used for simplicity. Also, as with chapter 4, this chapter presents condensed, simplified financial statements designed to illustrate only the basic concepts and information presented. The illustrations are non-authoritative and shall not be viewed as criteria against which to audit. Authoritative guidance for display of financial statements prepared pursuant to the CFO Act (as amended) is provided by OMB in its bulletin on form and content.

DECREASE IN THE ANNUAL LEAVE LIABILITY

127. Chapter 4 illustrated reporting an increase in the unfunded liability for annual leave. This has been the situation most agencies have encountered as their staffs or budgets have grown. However, as the Government has recently begun downsizing, agencies are beginning to encounter situations in which the annual leave liability decreases rather than increases.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

128. For appropriated entities, when the annual leave liability *increases*, it is shown on the Statement of Financing as a reconciling item under the caption “financing sources yet to be provided.” This is because the budget does not recognize an increase in annual leave as an obligation, but financial accounting recognizes it as an expense. Obligations are recorded in the year the leave is paid. Hence, as shown in chapter 4, any increase in an unfunded annual leave liability creates a situation in which obligations are less than net cost of operations, and the difference is reconciled by adding the increase in annual leave as financing sources yet to be provided.

129. When the annual leave liability *decreases*, the expense for annual leave decreases accordingly, and the net cost of operations is less as a result. Reporting is not symmetrical to that for increases in the annual leave liability. Assume, for example, the following situation:

Annual Leave Liability, October 1	$ 40
Annual Leave Accrued for the Year	600
Annual Leave Paid During the Year	(605)
Annual Leave Liability, September 30	$ 35

130. In this instance, obligations of $605 would have been recorded for the leave paid. However, net cost of operations would be increased by only $600 for annual leave, the expense of leave accrued. The $5 decrease in the annual leave liability is a reconciling item which must be subtracted from obligations to yield net cost of operations. Because that $5 of the $605 in obligations did not fund the net cost of operations, which was only $600, it is subtracted under the caption "resources that do not fund net cost of operations."

131. An abbreviated Statement of Financing for the situation is shown below. Note that, based solely on the transaction described above, obligations are $605 and net cost of operations is $600.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Obligations Incurred	$605
Resources That Do Not Fund Net Cost of Operations	
Decrease in Annual Leave Liability	(5)
Net Cost of Operations	$600

ASSETS ACQUIRED BY CAPITAL LEASE

132. The Government may enter into an agreement to lease the use of assets in such a way that the benefits and risks of ownership are substantially transferred from the lessor to the Government. In such cases, the economic substance of the transactions is that the assets are effectively purchased. These agreements are called "capital leases" in financial accounting. The standards for accounting for leases are prescribed in SFFAS No. 5, Accounting for Liabilities of the Federal Government, pp. 14-15, and SFFAS No. 6, Accounting for Property, Plant, and Equipment, pp. 5, 6 and 10.

133. Such leases have been treated distinctively in the budget for new leases since FY 1991, when guidance relating to the leases was phased in over a two-year period. The budgetary rules have many similarities in substance with the financial accounting standards, though there are differences in terminology. The budget classifies these leases as "lease-purchases without substantial private risk," "lease purchases with substantial private risk," and "capital leases." These categories cover approximately the same leases that financial accounting terms "capital leases." The budgetary rules and terminology are prescribed in OMB's Circular A-11, Preparation and Submission of Budget Estimates (1995), Appendix B.

134. The budgetary requirements for obligating what the budget calls capital leases and lease purchases are the same. They are discussed together here. There are differences in how the outlays related to these lease types are determined for purposes of budgetary reporting, but this does not affect the Statement of Financing. Because OMB's guidance grandfathers budgetary accounting practice for leases entered into prior to the current guidance, this section

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

discusses preparing the Statement of Financing under both the current guidance and prior practice. The more generic financial accounting term, "capital leases," is used in the discussion and illustrations that follow.

135. **Current Guidance.** When an asset is purchased under a capital lease arrangement, the budget is obligated in the amount of the present value of the lease payments. The difference between the present value of the lease and the total of the lease payments represents interest expense and is amortized over the term of the lease using present value techniques. The interest expense determined for each year is recognized as an obligation in the budget for that year. Depreciation expense is not recognized in the budget. Financial accounting treats the present value of the lease payments as an asset when acquired, recognizes interest expense over the term of the lease, and reports depreciation expense over the useful life of the asset. Accordingly, the difference between obligations incurred and net cost of operations is the amount of the present value of the lease in the year of acquisition and the amounts of depreciation expense over the life of the asset.

136. Assume, for example, that a 3-year lease is entered into that calls for payments of $100 in each year. The present value of the lease payments is $250; interest expense amortized is $25, $15, and $10 for years 1, 2, and 3 respectively; and depreciation expense is $30, $30, and $30 for years 1, 2, and 3, respectively. (Note that depreciation is charged over the life of the asset, which may be different from the term of the lease.) Thus, obligations incurred are $275 (the $250 present value of the lease payments plus the first year interest of $25) in Year 1, and $15 and $10 for years 2 and 3, respectively--the amount of the interest expense for those years. The net cost of operations for each year is the sum of the interest and depreciation expenses. The resulting Statements of Financing for the three years are shown below.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

	Year 1	Year 2	Year 3
Obligations Incurred	$275	$ 15	$ 10
Resources That Do Not Fund Net Cost of Operations:			
Capitalized assets acquired	(250)	0	0
Costs That Do Not Require Resources:			
Depreciation expense	30	30	30
Net Cost of Operations	$ 55	$ 45	$ 40

137. Note that this presentation has the same reconciling items as would be the case for an asset acquired by direct purchase. This is because the resulting interest expense on the capital lease, which is the principal difference between an asset acquired by capital lease and an asset acquired by direct purchase, is recognized as an obligation by the budget and as an expense in the cost of operations.

138. **Prior Practice.** For capital leases entered into prior to the current guidance, the budget is obligated in the amount of the annual lease payments and the interest expense is not recognized as an obligation. This is the same as for operating leases in financial accounting. Under prior practice, the budget often did not distinguish between capital and operating leases, but rather treated them all like operating leases. Depreciation expense, not recognized in the budget under current guidance, was also not recognized on assets acquired through leases reported in the budget under prior practice. The financial accounting treatment for capital leases is the same whether they fall under current budgetary reporting guidance or prior practice. Thus, the items required to reconcile obligations incurred with net cost of operations are the annual lease payments, interest expense, and depreciation expense.

139. Assume, for example, that there are three

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

$100 payments remaining on a capital lease entered into prior to FY 1991. Interest expense on the capital lease for financial accounting purposes is $25, $15, and $10 and depreciation expense is $30, $30, and $30, respectively, for the three years. (Again, note that depreciation is charged over the life of the asset, which may be different from the term of the lease.) The net cost of operations is the sum of the depreciation and interest expense. The Statement of Financing for those years would appear as shown below.

	Year 1	Year 2	Year 3
Obligations Incurred	$100	$100	$100
Resources That Do Not Fund Net Cost of Operations:			
Payments on capital leases	(100)	(100)	(100)
Costs That Do Not Require Resources:			
Depreciation expense	30	30	30
Interest expense	25	15	10
Net Cost of Operations	$ 55	$ 45	$ 40

TRANSFERS OF ASSETS IN AND OUT WITHOUT REIMBURSEMENT

140. Assets are sometimes transferred from one agency to another without reimbursement. In such cases, the donating agency reports the transaction as a transfer-out (a negative financing source) in its Statement of Changes in Net Position, which reduces its cumulative results of operations and total net position. The receiving agency reports the transaction as a transfer-in (a positive financing source that increases its cumulative results of operations and total net position) on its Statement of Changes in Net Position. Treatment on the Statement of Financing is described below:

(a) Obligations are not affected for either agency, but the donating

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

agency reports a decrease in its nonbudgetary resources and a decrease in its costs capitalized on the Balance Sheet in the amount of the book value of the asset transferred on its Statement of Financing. The transaction has no effect on net cost of operations of the donating agency. The receiving agency reports an increase in its nonbudgetary resources in the amount of the book value of the asset, if known, or for the fair market value of the asset, if not. Whether adjustments to obligations, as adjusted, and nonbudgetary resources are required on the receiving agency's Statement of Financing depends on whether the receiving agency capitalizes the asset or expenses it on receipt.

(b) If the receiving agency capitalizes the asset on receipt, the amount capitalized is subtracted from obligations, as adjusted, and nonbudgetary resources under the caption "resources that do not fund net cost of operations." The transaction does not affect net cost of operations.

(c) If the asset is expensed on receipt, no adjustment to obligations, as adjusted, and nonbudgetary resources is required, since the amount of the expense would be part of net cost of operations. In this case, the net cost of operations would be financed by the transfer-in of the assets without reimbursement.

141. Assume, for example, that a donating agency gives an asset with a book value of $5,000 to a receiving agency, which knows the book value. The transaction would be reported on the Statements of Financing for the agencies as shown below under the following scenarios: (a) the receiving agency capitalizes the asset, and (b) the receiving agency expenses the asset. Note that the reporting is the same under both scenarios for the donating agency, but it differs for the receiving agency.

a. If the receiving agency capitalizes the asset on receipt, the Statements of Financing would be prepared in this manner:

	Receiving Agency	Donating Agency

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Obligations Incurred	$ 0	$ 0
Nonbudgetary Resources:		
Transfers of Assets from (to) Others without Reimbursement	5,000	(5,000)
Obligations, as adjusted, and Nonbudgetary Resources	5,000	(5,000)
Resources That Do Not Fund Net Cost of Operations		
Costs capitalized on the Balance Sheet	(5,000)	N/A
Capitalized costs removed from the Balance Sheet	N/A	5,000
Net Cost of Operations	$ 0	$ 0

b. If the receiving agency expenses the asset on receipt, the Statements of Financing would be prepared in this manner:

	Receiving Agency	Donating Agency
Obligations Incurred	$ 0	$ 0
Nonbudgetary Resources:		
Transfers of assets from (to) others without reimbursement	5,000	(5,000)
Obligations, as adjusted, and Nonbudgetary Resources	5,000	(5,000)
Resources That Do Not Fund Net Cost of Operations		
Costs capitalized on the Balance Sheet	0	N/A
Capitalized costs removed from the Balance Sheet	N/A	5,000
Net Cost of Operations	$5,000	$ 0

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

SALE OF CAPITALIZED ASSETS

142. An agency may sell its capitalized assets at a gain, a loss, or for book value (which would result in no gain or loss). The budget would recognize the amounts collected from the sale, regardless of whether they resulted in gains and losses, and would subtract those amounts as adjustments to yield obligations, as adjusted. Thus, the reconciling factor for each instance would be the book value of the capitalized assets sold.

143. Assume, for example, three scenarios in which an agency has a piece of equipment with a book value of $25 and sells it for (a) $30, (b) $15, and (c) $25. Obligations would be -$30, -$15, and -$25, and net cost of operations would be -$5, +$10, and $0 for each of the scenarios, respectively. The Statements of Financing are illustrated as follows.

Scenarios:	(A)	(B)	(C)
Obligations Incurred	$ 0	$ 0	$ 0
Spending authority from offsetting collections	(30)	(15)	(25)
Obligations, as adjusted, and Nonbudgetary Resources	($30)	($15)	($25)
Resources That Do Not Fund Net Cost of Operations			
Capitalized costs removed from the Balance Sheet	25	25	25
Net Cost of Operations	($5)	$10	$ 0

144. Note in this example that the capitalized costs removed from the Balance Sheet were added to obligations. Costs capitalized on the Balance Sheet are subtracted from obligations, because those obligations do not fund costs (see the illustrations in chapter 4). When capitalized costs are removed, they must be treated in the opposite manner and added back in the reconciliation between obligations and net cost of

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

operations.

145. The present illustration provides a line item for “capitalized costs removed from the Balance Sheet.” An alternative display might net those costs removed against the costs of assets acquired and capitalized on the Balance Sheet. If the costs removed are not material, it might present the net as a single line item entitled "net costs capitalized on the Balance Sheet."

EXCHANGE REVENUE FROM THE PUBLIC

146. OMB Circular A-34 provides that when an agency performs reimbursable services for others, receivables from work performed are normally considered budgetary resources if the work is performed for another Government agency. If the work is performed for the public, however, budgetary resources are recognized only to the extent receivables are collected. Financial accounting recognizes revenue accrued from both intragovernmental and public receivables. Thus, the change in accrued receivables relating to exchange revenue from the public is a reconciling item between obligations and net cost of operations.

147. Assume, for example, that at the beginning of Year 1, receivables were zero. During Year 1, $100 was collected from the public for services performed and $15 additional was billed but not yet collected at year-end. In Year 2, $125 was collected, including the $15 owed at the beginning of the year, and an additional $10 was accrued.

148. The collections of $100 and $125 are subtracted from obligations incurred on the Statement of Financing for Years 1 and 2, respectively. However, the amounts subtracted from expenses on the Statement of Net Cost are $115 for Year 1 and $120 for Year 2. This is because financial accounting, on which the Statement of Net Cost is based, essentially recognizes revenue when it is earned by providing goods or services regardless of when collections are made.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

149. The $15 of receivables from the public at the end of Year 1 is part of the revenue recognized for financial accounting purposes. Thus, the Year 1 revenue reported on the Statement of Net Cost is the sum of the collections, $100, and the $15 receivable from the public at year-end: $115. In Year 2, only $110 of the $125 in collections is recognized as revenue for financial accounting purposes, because the $15 collected for receivables from the public as of the end of Year 1 was already counted as revenue in Year 1. The $10 of receivables from the public accrued at the end of Year 2 is also recognized as revenue for financial accounting purposes. The $110 and $10 together equal $120: the Year 2 revenue reported on the Statement of Net Cost.

150. The Statements of Financing reconciling the differences between obligations and net cost of operations are illustrated and explained below:

	Year 1	Year 2
Obligations Incurred	$ 0	$ 0
Spending Authority from Offsetting Collections	(100)	(125)
(Increase) Decrease in Exchange Revenue Receivable From the Public	(15)	5
Obligations, as adjusted, and Nonbudgetary Resources	($115)	($120)
Net Cost of Operations	($115)	$(120)

151. Note that in Year 1, collections were $100, which was recognized as spending authority from offsetting collections in the budget. This is subtracted from obligations incurred. However, the net cost of operations is -$115 (indicating an excess of exchange revenue over expenses). The $15 difference is explained by the $15 increase in accounts receivable from the public. This is not considered to be spending authority for budgetary purposes, but is recognized and accrued as revenue on the Statement of Net Cost. It was not included in spending authority from offsetting collections, but it was subtracted from expenses to yield net cost of operations. Hence, to reconcile

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

obligations incurred with net cost of operations, it must be subtracted in the reconciliation on the line for exchange revenue accrued from the public.

152. In Year 2, collections were $125 and were recognized as spending authority from offsetting collections in the budget. However, the net cost of operations is -$120, indicating an excess of revenue over expenses. In this case the difference is explained by two factors. First, for the same reasons as explained for Year 1, the ending $10 in accounts receivable from the public must be subtracted in the reconciliation. Second, the collections would have included the $15 of receivables accrued at the end of Year 1. This is considered spending authority from offsetting collections, but it is not recognized as revenue on the Statement of Net Cost in Year 2 because it was already recognized there in Year 1. Because it was subtracted in the line for spending authority from offsetting collections but was not subtracted from expenses to yield net cost, it must be added back in the reconciliation. The difference between the $10 subtraction and $15 addition is reflected in the $5 addition on the line for exchange revenue accrued from the public.

SPECIAL TOPICS RELATED TO DISCRETIONARY DIRECT LOAN AND LOAN GUARANTEE PROGRAMS

Introduction

153. Reporting loans made subsequent to the Credit Reform Act of 1990 on the Statement of Financing is illustrated in chapter 4. The following paragraphs set forth some important observations about the illustrations and information regarding these and additional transactions related to credit reform and pre-credit reform loans. The transactions are applicable to direct loans and loan guarantees in programs operated under both credit reform and pre-credit reform authority unless otherwise specified. They include:

- making direct loans;
- collecting loan principal for direct loans and for defaulted guaranteed loans assumed by the Government for direct collection;

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

- making upward and downward subsidy re-estimates for direct loan and loan guarantee programs (credit reform only)
- writing off defaulted loans; and
- accruing bad debts expense (pre-credit reform only).

154. The transactions discussed in the following sections are only for normal situations applicable to the program, financing, and liquidating funds of discretionary credit programs under the Credit Reform Act, which constitute most credit programs. Mandatory credit programs have different accounting requirements for some transactions, which would be reported differently on the Statement of Financing. In addition, some credit programs may operate in part under separate legislation which also has different accounting and reporting requirements. Authoritative information on credit program terminology and related accounting and reporting is found in SFFAS No. 2, Accounting for Direct Loans and Loan Guarantees, in Section 12 of OMB Circular A-34, Instructions on Budget Execution (December 1995), in Section 33 of OMB Circular A-11, Preparation and Submission of Budget Estimates, and in OMB Bulletin 94-01, Form and Content of Agency Financial Statements (or its successor).

Reconciliations and the chapter 4 case

155. The results of budgetary and proprietary accounting for direct loans require several factors on the Statement of Financing to reconcile between obligations and net cost of operations. Three reconciling factors are (1) loans made, (2) subsidy expense other than for reestimates, and (3) collections of loan principal. The reason for these reconciling factors is that, for budgetary purposes, loans made are obligations, and collections of loan principal are offsetting collections which are subtracted from obligations to obtain obligations, as adjusted. On the other hand, for financial (proprietary) accounting purposes, loans made are considered increases in assets (specifically, loans receivable),

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

collections of loan principal are considered decreases in assets, and a subsidy expense is recognized for the amount of the loans financed by the subsidy (not including reestimates, which are discussed later).

156. Thus, the reconciliation requires that the loans made, less the subsidy expense (other than for reestimates), be subtracted from obligations, since this is the amount of loans made that has not been recognized as an expense and, therefore, does not affect net cost of operations. The reconciliation also requires that collections of loan principal must be added back in reconciling net cost of operations to obligations. This is because these collections are subtracted from obligations in calculating "obligations, as adjusted," as explained above, but do not enter into the computation of the net cost of operations for financial accounting purposes (although they reduce the asset "loans receivable"). The same reconciliation is also needed for collections of the loan principal of guaranteed loans assumed for direct collection by the Government when the lender declares them in default. These three reconciling factors are types of "resources that do not fund net cost of operations" in the Statement of Financing. They explain the crosswalk regarding loans provided in figure 11 of the chapter 4 case illustration: "4800 Obligations for Loans Made (D) minus 4262 Collections of Loan Principal minus 6100 Subsidy Expense other than for reestimates (D)."

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

157. The fourth reconciling factor between obligations incurred and net cost of operations for direct loans is interest income from amortization of the allowance for subsidy. The reconciliation is required because the interest is recognized as an exchange revenue for financial accounting purposes and reduces net cost of operations, but it is not included in obligations for purposes of the budget. The interest is reported on the Statement of Financing as a subtraction under "exchange revenue not in the budget" in the section on obligations and nonbudgetary resources. The reporting is illustrated in figure 11 of chapter 4 (the $5 of "Interest Income--Subsidy Amortization"). The same reconciliation is needed for the amortization of subsidy related to loans under loan guarantee programs assumed for direct collection by the Government when the lender declares them in default.

158. The chapter 4 case also illustrated proprietary accounting for an upward reestimate of the subsidy as of the end of the year and an accompanying accrual of interest expense and interest income on the reestimate amount. The budget did not recognize these transactions in the year of accrual, and other reconciling factors between obligations and net cost of operations arose as a result. Of course, downward reestimates can also occur, with similar need for reconciliation. Reporting upward and downward subsidy reestimates and related interest on the Statement of Financing for the year of accrual and the succeeding year is discussed in the next sub-section, which deals with subsidy reestimates (see page 99).

159. The chapter 4 case covered loans made under the Credit Reform Act. However, agencies still operate liquidating funds for programs authorized under legislation prior to that Act. Because the proprietary rules for recognizing expenses are different for loans made under pre-credit reform authority, the reconciliation between obligations incurred and net cost of operations is different. This is discussed in more detail in the subsection on pre-credit reform loans (see page 104).

160. The chapter 4 case did not illustrate writeoffs of defaulted loan principal. Such

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

writeoffs--under both the Credit Reform Act and authority prior to the Act--do not enter into the reconciliation between obligations incurred and net cost of operations. This is because they do not affect obligations, nor are they recognized in the Statement of Net Cost. For financial accounting purposes, they reduce both loans receivable and (for Credit Reform Act loans) the related allowance for subsidy account, which are offset in the assets section of the Balance Sheet, as shown in figure 9 of chapter 4. For loans made prior to the Credit Reform Act, the related allowance account is termed "allowance for uncollectible accounts" (or an equivalent title) rather than "allowance for subsidy." Although an allowance for uncollectible accounts is computed differently than an allowance for subsidy, the nature of the reporting display is the same--it is offset against loans receivable. The same reconciliation is needed for the writeoff of guaranteed loans assumed for direct collection by the Government when the lender declares them in default.

Subsidy reestimates

161. When an upward subsidy reestimate for credit reform loans is made as of the end of the year, it is accrued in the program fund as additional subsidy expense payable to the financing fund, along with interest expense on the subsidy, which is also payable to the financing fund. The financing fund accrues a related receivable for the total of the reestimate and interest, recognizes an increase in the allowance for subsidy in the amount of the re-estimate, and recognizes an exchange revenue for the interest on the subsidy. The payable in the program fund is eliminated against the receivable in the financing fund before proprietary financial statements are prepared. Although monies will come from a permanent indefinite appropriation in the following year, the amount is not apportioned in the year of accrual, and, accordingly, no receivable from the appropriation may be accrued. For budgetary purposes, the obligation for the subsidy reestimate and interest is recognized in the succeeding year. The table below summarizes this information:

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

	Current Year	Succeeding Year
Budgetary Accounting		
Recognition of obligations	No	Yes
Proprietary Accounting		
Recognition of expenses	Yes	No
Recognition of exchange revenue	Yes	No

162. Because of this difference in timing, the reconciliation between obligations incurred and net cost of operations for an upward revision of subsidy is different both for the year of accrual, in which the subsidy and interest expense and related interest revenue are recognized for financial accounting purposes, and for the subsequent year, in which the related obligations are recognized for budgetary purposes. Using the information in chapter 4, assume, for example, that in Year 1, an upward subsidy reestimate of $8, with interest of $1, is recorded as of the end of the year. Because the budget does not recognize this until the following year, obligations are zero in Year 1 and $9 in Year 2. Net Cost of Operations will be $8 in Year 1 ($9 in expenses less $1 of interest income) and zero in Year 2. The Statement of Financing reconciliation for this is shown below. Note that the additional interest income to offset interest expense on the subsidy reestimate is recognized in the financing fund, which is nonbudgetary. Accordingly, it is shown under the caption "exchange revenue not in the budget."

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

	Year 1	Year 2
Obligations and Nonbudgetary Resources		
Obligations Incurred	$ 0	$ 9
Less Exchange Revenue Not in the Budget: Interest Income on Subsidy Reestimate	(1)	N/A
Obligations, as adjusted, and Nonbudgetary Resources	(1)	9
Resources That Do Not Fund Net Cost of Operations		
Financing Sources That Fund Costs of Prior Periods	N/A	(9)
Financing Sources Yet to Be Provided	9	N/A
Net Cost of Operations	$ 8	$ 0

163. When a recomputation of the subsidy as of the end of the year results in a smaller amount than previously recognized, the reestimate is downward. For proprietary accounting purposes, three adjustments are required for this. They are recognized in the year for which the reestimate is made. First, the excess subsidy and interest on that excess must be paid to a special receipt account of the Treasury. Second, more allowance for subsidy must be amortized to interest income. Amortization is based on the amount of interest expense from all sources less interest expense other than the reestimate. Had the subsidy initially been calculated correctly, it would have been less, and correspondingly more would have been borrowed from Treasury. This would have caused interest expense on the borrowing to be greater, and more would have been amortized from the subsidy as a result. However, because the subsidy was greater than it should have been, less was borrowed from Treasury, and less was amortized from the allowance for subsidy account. Hence, the allowance for subsidy is overstated and must be further amortized to interest income in the amount of interest expense from the reestimate--just as it would have been had more been borrowed from Treasury in the first place and more interest expense had been incurred. Third, both subsidy

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

expense and the related financing source "appropriations used" must be reduced by the amount of the excess subsidy received.

164. The result of the adjustments discussed above which affect the Statement of Financing is that net cost of operations is reduced by the amount of the excess subsidy. This is because of the following effects of the adjustments. First, interest expense is recognized in the amount of the actual interest incurred on the borrowing from Treasury plus the amount of the interest on the reestimate. This provides for the same amount of interest expense as would be the case if the subsidy had initially been estimated correctly, the borrowing from Treasury greater, and the interest on that borrowing greater. The interest is divided into two parts--interest expense on the borrowing from Treasury and interest expense on the downward reestimate. Second, the adjustments provide for the same amount of interest income that would have been amortized from the allowance for subsidy if the interest expense had been based on a greater borrowing from Treasury. That interest income is also divided into two parts--interest income from the basic amortization and interest income from the reestimate. The total interest expense and total interest income (which would also include interest income from borrowers), both of which appear on the Statement of Net Cost, will be the same. Hence, the net cost of operations is unaffected by interest.

165. Third, the allowance for subsidy is reduced by the amount to be paid to the special receipt account, and that amount is shown as a liability. Neither the allowance for subsidy nor the liability to Treasury appears on the Statement of Net Cost, and, again, the net cost of operations is unaffected. Finally, both subsidy expense and appropriations used are reduced in the amount of the excess subsidy. The reduction in subsidy expense appears on the Statement of Net Cost. However, the reduction in appropriations used, which is not an expense or an exchange revenue, does not. Thus, the net cost of operations is reduced by the amount of the excess subsidy received. (Net results of operations, which includes appropriations used and additional financing sources other than exchange revenue, is unchanged by the transactions, as is net position. This is appropriate, because the adverse effects

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

on cash flows from returning the excess subsidy and interest should be offset by increased cash inflows from other sources over the life of the loans. These sources might include a lower default rate on loans than originally estimated or other items which were factors in reestimating the subsidy.)

166. Under budgetary accounting rules, an obligation for the excess subsidy and interest would be recorded in the year following the reestimate rather than in the year the reestimate was made. In the year following the reestimate, the amount of the obligation, which is paid to a special receipt account of the Treasury, is also reported in the budget as an offsetting receipt (which does not adjust obligations) rather than as an offsetting collection credited to an expenditure account (which does). Hence, the factors necessary to reconcile obligations with net cost of operations involve (1) the timing of the recognition of obligations for budgetary purposes and of expenses and revenues for proprietary purposes, (2) the additional interest income to offset interest expense on the reestimate, and (3) the decrease in subsidy expense from the reestimate. Assuming the same facts as in paragraph 0, except that the reestimate is downward rather than upward, net cost of operations would be -$8 in Year 1 (the $1 of interest expense less the $8 reduction in subsidy expense and less the $1 of interest income) and zero in Year 2. Obligations would be zero in Year 1 and $9 Year 2. The credit agency's Statement of Financing for the two years would be as shown below. Note that the interest income appears under the caption "exchange revenue not in the budget."[27]

[27]For purposes of the Statement of Financing, exchange revenues categorized in the budget as offsetting receipts, which do not provide spending authority from offsetting collections credited to an expenditure account, are treated as nonbudgetary exchange revenues.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

	Year 1	Year 2
Obligations and Nonbudgetary Resources		
Obligations Incurred	$ 0	$ 9
Less Exchange Revenue Not in the Budget: Interest Income on Subsidy Reestimate	(1)	N/A
Other Nonbudgetary Resources: Reduction in Subsidy Expense from Downward Reestimate	(8)	N/A
Obligations, as adjusted, and Nonbudgetary Resources	(9)	9
Resources That Do Not Fund Net Cost of Operations		
Obligations for payment of excess subsidy and interest	N/A	(9)
Costs That Do Not Require Resources		
Interest Expense-Downward Reestimate	1	N/A
Net Cost of Operations	$ (8)	$ 0

167. The observations and illustrations in paragraphs 0-0 would also be applicable to subsidy reestimates for loan guarantee programs, except that the loan guarantee liability rather than the allowance for subsidy would be involved in the journal entries and computations, and direct loans would not be made. If the Government assumes defaulted guaranteed loans for direct collection, both the loan guarantee liability and the allowance for subsidy would be involved.

Pre-credit reform loans

168. There are many similarities in accounting for loans under credit reform and pre-credit reform rules. For budgetary accounting purposes, the making of pre-credit reform loans also results in an obligation, albeit the obligation is against different budget authority. Collection of loan principal is also recorded as an offsetting collection. There is no subsidy appropriation connected with pre-credit reform loans, however, and no obligation is recognized for defaults when they occur. For

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

financial accounting purposes, loans issued under pre-credit reform authority are accounted for as assets, and collections of loan principal are recorded as decreases in those assets. However, instead of a subsidy expense, a bad debts expense for defaults is recognized.

169. Accordingly, for pre-credit reform loans, the reconciliation between obligations and net cost of operations requires that bad debts expense be added to obligations, as adjusted. Assume, for example, that during a year $500 of pre-credit reform loans are made; $30 of principal is collected; and $100 of bad debts expense is recognized. In this case, obligations, as adjusted, are $470 ($500 in loans made less $30 in principal collections), and the net cost of operations is $100 (the amount of the bad debts expense). The resulting reconciliation on the Statement of Financing is shown in the pre-credit reform column below. Loans made, less collections of principal, are subtracted from obligations, as adjusted, under the caption "resources that do not fund net cost of operations"--the same reconciliation adjustment as for credit reform loans; and bad debt expenses are added under "costs that do not require resources." The next column contrasts that with the reconciliation for credit reform loans (assuming for sake of illustration a subsidy expense of $100 rather than a bad debts expense of $100).

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

	Pre-Credit Reform	Credit Reform
Obligations Incurred	$500	$500
Spending Authority from Offsetting Collections	(30)	(30)
Obligations, as adjusted, and Nonbudgetary Resources	$470	$470
Resources That Do Not Fund Net Cost of Operations		
Loans Made	(500)	(500)
Less: Subsidy Expense	N/A	100
Collections of Loan Principal	30	30
Costs That Do Not Require Resources		
Bad Debts Expense	100	N/A
Net Cost of Operations	$100	$100

170. The lines for spending authority from offsetting collections and for collections of loan principal in the illustration above would also be applicable to both credit reform and pre-credit reform guaranteed loans assumed for direct collection by the Government when the lender declares them in default. Note that the negative $30 and the positive $30 for those two lines would cancel and result in zero net cost of operations under both credit reform and pre-credit reform programs. Net cost of operations from this transaction is zero because, as explained above, the collection of loans does not affect net cost of operations.

171. The line for bad debts expense would also apply to the recognition of the expense related to pre-credit reform defaulted guaranteed loans that have been assumed. Considering only the bad debts expense in the illustration above, net cost of operations would be $100, but, because the budget does not recognize bad debts expense as an obligation, obligations would be zero. The reconciling factor would be the $100 of bad debts expense, as shown in the pre-credit reform column of the illustration.

This is the original Implementation Guide to SFFAS 7 and was replaced by the Revised Implementation Guide at http://www.fasab.gov/pdffiles/impguid7200204.pdf. Neither guide has been updated for subsequent changes to SFFAS 7; please check for the most recent SFFAS 7 file in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

172. Bad debts expense is not applicable to programs operating under authority of the Credit Reform Act.

Subsidy expense for defaulted guaranteed loans: credit reform

173. Subsidy expense related to defaulted guaranteed loans assumed for direct collection by the Government would not be a reconciling item between obligations and net cost of operations, as it is for loans made in a direct loan program under the Act. This is because the only accounting requirement for subsidy relating to the assumed loans in the guarantee program is that a portion of the loan guarantee liability be reclassified as "allowance for subsidy," which is subtracted from the asset "loans receivable" on the Balance Sheet. Such a reclassification does not involve expenses or exchange revenue and, accordingly, would not affect net cost of operations. The reclassification is also not recognized as an obligation under budgetary accounting rules. Since neither net cost of operations nor obligations is affected, no reconciliation is required.

THE FEDERAL ACCOUNTING STANDARDS ADVISORY BOARD

Elmer B. Staats, Chairman

James L. Blum	Gerald Murphy
Donald H. Chapin	James E. Reid
Martin Ives	Cornelius E. Tierney
Norwood Jackson	Alvin Tucker

The Secretary of the Treasury, the Director of the Office of Management and Budget, and the Comptroller General established the Federal Accounting Standards Advisory Board (the FASAB or "the Board") in October 1990 to consider and recommend accounting principles for the United States Government.

The Board communicates its recommendations by publishing recommended accounting standards after considering the financial and budgetary information needs of Congress, executive branch agencies, and other users of Federal financial information. The Board also considers comments from the public on its proposed recommendations, which are published for comment as "exposure drafts." The Board's sponsors, i.e., the officials who established the Board, then decide whether to adopt the recommendations. If they do, the standard is published by OMB and the GAO and then becomes effective.

Additional background information is available from the FASAB, including: (1) the "Memorandum of Understanding among the General Accounting Office, the Department of the Treasury, and the Office of Management and Budget, on Federal Government Accounting Standards and a Federal Accounting Standards Advisory Board" and (2) the "Mission Statement of the Federal Accounting Standards Advisory Board."

APPLICABILITY, MATERIALITY, AND TERMINOLOGY

These standards apply to general purpose financial reports of U.S. Government reporting entities. These standards need not be applied to immaterial items unless otherwise noted. Statement of Federal Financial Accounting Concepts No. 2 (SFFAC No. 2), Entity and Display, lists criteria for defining Government reporting entities. Paragraph 78 of Entity and Display notes that some of a reporting entity's components may be required by law or policy to issue financial statements in accordance with accounting standards other than those recommended by the FASAB and issued by the OMB and the GAO, e.g., accounting standards issued by the Financial Accounting Standards Board or by a regulatory agency. Those components should continue to issue the required reports. The reporting entities of which the components are a part, however, need to be sensitive to differences that may arise because of different accounting standards. If these differences are material, the standards recommended by the FASAB and issued by the OMB and the GAO should be applied. The components would need to provide any additional disclosures or different recognition and measurement required by the accounting standards issued by the OMB and the GAO that are not required by other standards.

"Disclosure" in this document indicates providing information in notes or narrative regarded as an integral part of the basic financial statements. "Supplementary" indicates providing information that is regarded as "required supplementary information" as that term is used in accounting and auditing standards. The limited auditing procedures for this information are defined in auditing standards. "Other accompanying information" refers to unaudited information that accompanies the audited financial statements. It is not regarded as essential for "fair presentation." Another kind of supplementary information is "Required Supplementary Stewardship Information." This is a proposed category unique to Federal Government accounting and auditing standards. It refers to certain information for which FASAB expects OMB and GAO in collaboration to agree upon appropriate auditing procedures. It will be regarded as essential for "fair presentation."

PREFACE

This document contains two separate parts. The first, on revenue and other financing sources, is composed of the introduction, accounting standards, and appendices. After the standards recommended by FASAB are approved by the Secretary of the Treasury, the Director of the Office of Management and Budget, and the Comptroller General and are published, the standards provide authoritative guidance to those who prepare and audit general purpose financial reports of U.S. Government entities.

The second part of this document amends Statement of Federal Financial Accounting Concepts No. 2, Entity and Display, by adding a new concept to satisfy users' needs for information that reconciles budgetary and financial accounting. This concept is presented in the section of this document that begins on page **Error! Bookmark not defined.**. Statements of Federal Financial Accounting Concepts articulate the framework within which the Board considers and recommends accounting standards. Statements of concepts do not provide authoritative guidance to preparers and auditors.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

EXECUTIVE SUMMARY

ACCOUNTING STANDARDS FOR REVENUE AND OTHER FINANCING SOURCES

SCOPE

1. This Statement presents standards to account for inflows of resources from revenue and other financing sources. It provides standards for classifying, recognizing, and measuring resource inflows. These financial (proprietary) accounting standards differ from those used for budgetary accounting only to the extent essential to meet the Objectives of Federal Financial Reporting.

CLASSIFICATION, RECOGNITION, AND MEASUREMENT

2. Revenue is an inflow of resources that the Government demands, earns, or receives by donation. Revenue comes from two sources: exchange transactions and nonexchange transactions. Exchange revenues arise when a Government entity provides goods and services to the public or to another Government entity for a price. Another term for "exchange revenue" is "earned revenue." Nonexchange revenues arise primarily from exercise of the Government's power to demand payments from the public (e.g., taxes, duties, fines, and penalties) but also include donations. The term "revenue" does not encompass all financing sources of Government reporting entities, such as most of the appropriations they receive. These other sources of financing do, however, provide resource inflows to Government reporting entities, so this Statement includes accounting standards for them.

3. These accounting standards recognize exchange revenue at the time that a Government entity provides goods or services to the public or to another Government entity. The revenue is measured at the price

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

likely to be received. Thus, with some differences that are explained in the standard, the accounting for earned revenue is comparable to the private sector's accrual accounting for earned revenue. Exchange revenue includes most user charges other than taxes. Such user charges include regulatory user charges, in which the exchange is not wholly voluntary but the revenue is generally, but not always, related to the cost of providing service to identifiable groups. One example is the revenue derived from the Securities and Exchange Commission's registration fees. Exchange transactions also include those intragovernmental transactions where the price serves as a full or partial reimbursement for the costs incurred.

4. Distinguishing exchange revenue from non-exchange revenue and other financing sources enables the entity to report the net cost of operations of its programs (and the cost of the entity to the taxpayer) and provides the accounting foundation to report unit cost of output measures for performance evaluations. Requiring that exchange revenue be matched with the cost of outputs of goods and services sold to the public enables the entity to report the cost to the taxpayer of not charging the full cost of those goods and services.

5. Nonexchange revenues include income taxes, excise taxes, duties, fines, penalties, and other inflows of resources arising from the Government's power to demand payments, as well as voluntary donations. Nonexchange revenue is recognized when a reporting entity establishes a specifically identifiable, legally enforceable claim to cash or other assets. It is recognized to the extent that the collection is probable (i.e., more likely than not) and the amount is measurable (i.e., reasonably estimable).[1]

6. In the case of taxes and duties, inherent and practical limitations on the assessment process serve to delay the time when the power

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

to demand payment becomes a legally enforceable claim to cash or other assets. For this reason, the method of accounting for taxes and duties can best be characterized as a modified cash basis of accounting, rather than an accrual basis. This basis of accounting amends the standard for the recognition of accounts receivable for taxes and duties. Cash basis tax revenue will continue to be accounted for as well, because of the fiscal importance of the information. The accrual accounting required will provide more accurate and complete information about receivables and refunds legally receivable and payable and about the components of the Government's revenue stream. The Board may review the standard for accrual of taxes and duties after several years. The Board has provided that in the interim the IRS and Customs may on their own initiative modify this standard so that it reflects a fuller application of the accrual concept.

7. Budgetary resources are recognized from two perspectives: the proprietary accounting perspective and the budgetary perspective. From the proprietary perspective, appropriations are accounted for as a financing source when used. Appropriations are used when an entity has acquired goods and services or has provided benefits and grants that are authorized to be paid by an appropriation. The remaining amount of appropriations enacted into law, but not yet recognized as "appropriations used," is treated as capital, i.e., "unexpended appropriations." This treatment parallels the recognition of expended appropriations during budgetary execution.

8. To the extent that other standards require that costs not on the entity's books be imputed to the entity, the standards for other financing sources require recognition of the corresponding imputed financing.

9. Financial statements have not previously presented budget execution information needed by users of those reports. Furthermore, concerns have been expressed about whether the budget is being properly executed in all cases. The standards presented in this document require the presentation and, consequently, the audit of information about budgetary resources, the status of those resources, and outlays. The standards also require a reconciliation of proprietary and budgetary information in

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

a way that helps users relate the two.

DISCLOSURES, SUPPLEMENTARY INFORMATION, AND OTHER INFORMATION

10. The different types of revenue, and the complexity of accounting for revenue and other financing sources, increase the importance of certain disclosures and other information.

11. Extensive disclosures and other information about taxes and duties compensate to some extent for the limited accruals under the modified cash basis of accounting. Such disclosures and other information also provide a better basis for estimating future cash flows, overseeing the custodial responsibilities given to the tax collecting entities, and understanding how the tax burden is shared.

12. Certain disclosures are required about exchange transactions where the full cost of goods and services sold is not recovered.

13. Limited disclosure concerning accountability for dedicated collections is required for reporting entities responsible for administering such funds. Supplementary information is required from those entities and the entities that make the collections in cases where trust funds may be over- or under-funded in terms of applicable law.

14. Disclosures are required about the use of borrowing authority and the status of budgetary resources that may affect future spending by the entity.

CONCEPTS FOR RECONCILING BUDGETARY AND FINANCIAL ACCOUNTING

15. This statement amends Statement of Federal Financial Accounting Concepts No. 2, Entity and Display, by adding a category of financial information to further satisfy users' needs and the objectives of financial reporting. More specifically, the amendment is designed to meet users' need to understand "how

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

information on the use of budgetary resources relates to information on the cost of program operations . . ." (sub-objective 1C). The objective of this new category of information is to provide an explanation of the differences between budgetary and financial (proprietary) accounting. This is accomplished by means of a reconciliation of budgetary obligations and nonbudgetary resources available to the reporting entity with its net cost of operations.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

6 PART I: ACCOUNTING FOR REVENUE AND OTHER FINANCING SOURCES

INTRODUCTION

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

BACKGROUND

16. The essential differences among exchange revenues, nonexchange revenues, and other financing sources affect the way they are recognized and measured under the accrual method of accounting. Properly classifying these inflows according to their nature, therefore, provides the basis for applying different accrual accounting principles. In addition, proper classification is essential to constructing financial statements that meet the federal financial reporting objectives,[2] as they have been described in Statement of Federal Financial Accounting Concepts No. 2, Entity and Display.

17. To help meet those objectives, classifications were developed to determine what specific kinds of revenue should be deducted from the cost of providing goods and services by the reporting entities. Only revenue classified as exchange revenue should be matched with costs. Nonexchange revenue and other financing sources are not matched with costs because they are not earned in the operations process. Because they are inflows that finance operations, nonexchange revenues and other financing sources should be classified in accordance with other rules and should be recognized only in determining the overall financial results of operations for the period. This differs from the focus used in the private sector, where the focus is on net income for business organizations, and on changes in net assets for not-for-profit organizations. It is also a different focus from that used previously in reporting on U.S. Government operations. Under the old federal accounting standards, the focus was on matching all of an entity's financing with incurred expenses to report "net results of operations" which generally was not useful in evaluating performance. The new focus is on costs --both gross and net--which are useful in evaluating performance on many levels.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

18. The concept of matching costs and revenue has little relevance in government except where there is an exchange transaction. An exchange transaction occurs when one party sacrifices value and receives a valuable good or service in return. The operations of an entity engaged in exchange transactions produce the revenue earned as well as the associated cost incurred. Therefore, financial accounting should relate the revenue to the cost for these transactions. The net effect--the gross cost minus the revenue, or the net cost--generally determines the extent to which taxpayers bear the cost of the operations.[33]

19. Information about the net cost of exchange transactions serves other purposes as well. Net cost gives one indication of the extent to which people are willing to make voluntary payments to acquire goods or services of the kinds that are sold. It thus can give an indication of the extent to which people judge the products to have value. Net cost also can be used in evaluating an entity's pricing policy.

20. Most importantly of all, both net cost and gross cost can be compared with outputs and outcomes in assessing the effectiveness and efficiency with which resources are used to achieve results. Such comparisons can be used by agency management, the President, and the Congress in making decisions about allocating resources. These standards, together with those in SFFAS No. 4, Managerial Cost Accounting Concepts and Standards, provide information essential to effective implementation of the Government Management Reform Act, which requires agencies to report performance measures such as unit cost. These standards, when applied in the context of applicable entity and display concepts, will make federal financial reporting more meaningful to those concerned with performance measurement.

[33] The only major exception is for intragovernmental sales of goods and services. The extent to which taxpayers bear the costs of these goods and services depends on whether the goods and services are sold to entities that in turn sell goods and services to the public, or to entities that are financed by taxes. The net cost of operations may also be financed by other nonexchange revenue such as fines, forfeitures, and donations.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

21. Nonexchange revenue transactions do not require a Government entity to give value directly in exchange for the inflow of resources. The Government does not "earn" the nonexchange revenue. The cost that nonexchange revenue finances falls on those who pay the taxes and make the other nonexchange payments to the Government. The different character of nonexchange revenues requires that they be distinguished from exchange revenues. They should, therefore, be shown in a way that does not obscure the entity's net cost of operations.

22. Although Board Members have differing views on whether social insurance programs result in exchange or nonexchange transactions, they agree that social insurance tax revenues should be shown in the same way as other tax revenues for the purposes of financial reporting.[34] Social insurance taxes, like other taxes, are determined by the Government's power to compel payment. Individuals and businesses that pay social insurance taxes are subject to them as a byproduct of their decision to enter covered employment or engage in a covered business. Especially for the major, broad-based social insurance programs-- Social Security, Medicare (hospital insurance), and unemployment compensation--the individuals and businesses have virtually no option except to pay.

23. The main sources of financing for the Government as a whole are exchange and nonexchange revenues and borrowing from the public. For component reporting entities, however, the sources of financing are provided through the budget and are largely financing sources other than revenue. Appropriations and other budget authority provide an agency with the authority to incur obligations to acquire goods and services or to provide benefits and grants. These other financing sources are not earned by an entity's operations. Therefore, as with nonexchange revenue, they should be accounted for in a way that does not obscure the entity's net cost.

[34] See discussion of social insurance programs in FASAB's Exposure Draft, Supplementary Stewardship Reporting.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

24. Budgetary resources have a different character than both exchange revenue and nonexchange revenue. Budgetary inflows should be shown in a way that reflects two different perspectives: the proprietary effect and the budgetary effect. Proprietary accounting treats these resources much as capital and lines of credit are treated in private sector accounting, and provides information about their availability in the Balance Sheet or in notes. Appropriations are recognized as capital when enacted into law, while borrowing authority is disclosed in notes. Because Government entities are expected to expend capital from appropriations rather than maintain it, the accounting for the use of appropriations differs in this respect from the private sector's accounting for capital. The accounting for "appropriations used" has been simplified and parallels their budgetary effect.

25. The budget provides the principal basis for planning and controlling obligations and expenditures by Government entities. Budget execution tracks the flow of budgetary resources from the congressional authorizing and appropriating process, to the apportionment, allotment, and obligation of the budgetary resources, to the outlay of cash to satisfy those obligations. For the most part, obligations and cash, rather than accrual accounting, are the bases for budgeting and reporting on budget execution.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

26. Those who prepare financial statements have recognized that accrual accounting and the budget are complementary. Accrual-basis accounting often provides better information than cash-basis accounting for evaluating performance. It can provide more information for planning and control of operations. Accrual accounting provides an understanding of a reporting entity's net position and cost of operations. U.S. Government financial statements have not been used for planning and control as well as they might have been. In part, this is because accounting standards have not been fully attuned to the Government's needs and circumstances. Another important reason is the continuing primacy of the budget as a financial planning and control tool. General purpose financial reports have not presented budget execution information with the financial statements in a way that helped users relate these two important, but different, types of financial information. The standards presented in this document provide the basis for reports that can deal with this problem.

MATERIALITY

27. Except as otherwise noted, the provisions of the accounting standards in this statement need not be applied to items that are qualitatively and quantitatively immaterial.

28. The determination of whether an item is material depends on the degree to which omitting or misstating information about the item makes it probable that the judgment of a reasonable person relying on the information would have been changed or influenced by the omission or the misstatement.

EFFECTIVE DATE

29. The provisions of this statement are effective for reporting periods that begin after September 30, 1997. Earlier application is encouraged.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

ACCOUNTING STANDARDS

SCOPE

30. These standards determine how a Government reporting entity should account for inflows of resources from revenue and other financing sources in its general purpose financial reports. Revenue is an inflow of resources that the Government demands, earns, or receives by donation. Revenue comes from two sources: exchange transactions and nonexchange transactions. Exchange revenues arise when a Government entity provides goods and services to the public or to another Government entity for a price. Another term for "exchange revenue" is "earned revenue." Nonexchange revenues arise primarily from exercise of the Government's power to demand payments from the public, such as taxes, duties, fines, and penalties. Nonexchange revenue also includes donations.

31. The term "revenue" does not encompass all financing sources of Government reporting entities, such as most of the appropriations they receive. These other sources of financing do, however, provide resource inflows to Government reporting entities, although not to the Government as a whole. Accordingly, standards for accounting for these inflows are also provided.

32. Appendix B, "Guidance for the Classification of Transactions," provides authoritative guidance on which transactions should be classified as exchange transactions and which should be classified as nonexchange transactions or other financing sources.

EXCHANGE REVENUE

33. Exchange revenue and gains are inflows of resources to a Government entity that the entity has earned. They arise from exchange transactions, which occur when each party to the transaction sacrifices value and receives value in return. That is, exchange revenue arises when a Government entity provides something of value to the public or another Government entity at a price.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

RECOGNITION AND MEASUREMENT OF EXCHANGE REVENUE

34. Revenue from exchange transactions should be recognized when goods or services are provided to the public or another Government entity at a price.

35. When a transaction with the public or another Government entity at a price is unusual or nonrecurring, a gain or loss should be recognized rather than revenue or expense so as to differentiate such transactions.

36. Revenue from specific types of exchange transactions should be recognized as follows:

(a) When services are provided to the public or another Government entity (except for specific services produced to order under a contract), revenue should be recognized when the services are performed.

(b) When specific goods are made to order under a contract (either short- or long-term), or specific services are produced to order under a contract (either short- or long-term), revenue should be recognized in proportion to estimated total cost when goods and services are acquired to fulfill the contract. If a loss is probable (more likely than not), revenue should continue to be recognized in proportion to the estimated total cost and costs should continue to be recognized when goods and services are acquired to fulfill the contract. Thus, the loss should be recognized in proportion to total cost over the life of the contract.[3]

(c) When goods are kept in inventory so that they are available to customers when ordered, revenue should be recognized when the goods are delivered to the customer.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

(d) When services are rendered continuously over time or the right to use an asset extends continuously over time, such as the use of borrowed money or the rental of space in a building, the revenue should be recognized in proportion to the passage of time or the use of the asset. The interest received on money borrowed in an intragovernmental transaction is an exchange revenue when the source of the borrowed funds is predominantly exchange revenue and is a nonexchange revenue when the source of the borrowed funds is predominantly nonexchange revenue or other financing sources.

(e) When an asset other than inventory is sold, any gain (or loss) should be recognized when the asset is delivered to the purchaser.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

37. When advance fees or payments are received, such as for large-scale, long-term projects, revenue should not be recognized until costs are incurred from providing the goods and services (regardless of whether the fee or payment is refundable). An increase in cash and an increase in liabilities, such as "unearned revenue," should be recorded when the cash is received. "Unearned revenue" should also be recorded if an agency requests advances or progress payments prior to the receipt of cash and records the amount.[35]

38. The measurement basis for revenue from exchange transactions should be the actual price that is received or receivable under the established pricing arrangements.

39. When cash has not yet been received at the time revenue is recognized, a receivable should be recorded. An appropriate allowance for estimated bad debts should be established.

40. To the extent that realization of the full amount of revenue is not probable due to credit losses (caused by the failure of the debtor to pay the established or negotiated price), an expense should be recognized and the allowance for bad debts increased if the bad debts can be reasonably estimated.[36] The amount of the bad debt expense should be separately shown.

---

[35] SFFAS No. 1, para. 41, provides that such request should be recorded if a claim to cash is established based on legal provisions, such as a payment due date.

[36] SFFAS No. 1, Accounting for Selected Assets and Liabilities, paragraphs 40-52, is the standard for estimating bad debts. The standard is further explained in SFFAS No.1's Basis for Conclusions, paragraphs 116-133.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

41. To the extent that realization of the full amount of revenue is not probable due to returns, allowances, price redeterminations, or other reasons apart from credit losses, the revenue that is recognized should be reduced by separate provisions if the amounts can be reasonably estimated. The amounts of such provisions should be reflected as revenue adjustments, rather than costs of operations, and should be separately shown.

42. The recognition and measurement of revenue and credit losses due to direct loans and loan guarantees is determined by SFFAS No. 2, *Accounting for Direct Loans and Loan Guarantees*. Appropriate allowances should be established as determined by those standards.

43. Exchange revenue should be recognized in determining the net cost of operations of the reporting entity during the period. The exchange revenue should be recognized regardless of whether the entity retains the revenue for its own use or transfers it to other entities. Gross and net cost should be calculated as appropriate to determine the costs of outputs and the total net cost of operations of the reporting entity. The components of the net cost calculation should separately include the gross cost of providing goods or services that earned exchange revenue, less the exchange revenue earned, and the resulting difference. The components of net cost should also include separately the gross cost of providing goods, services, benefit payments, or grants that did not earn exchange revenue.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

44. The net amount of gains (or losses) should be subtracted from (or added to) gross cost to determine net cost in the same manner as exchange revenue is subtracted. Exchange revenue that is immaterial or cannot be associated with particular outputs should be deducted separately in calculating the net cost of the program, suborganization, or reporting entity as a whole as appropriate. Nonexchange revenues and other financing sources should not be deducted from the gross cost in determining the net cost of operations for the reporting entity.

45. Under exceptional circumstances, such as rents and royalties on the Outer Continental Shelf, an entity recognizes virtually no costs (either during the current period or during past periods) in connection with earning revenue that it collects.

45.1. The collecting entity should not offset its gross costs by such exchange revenue in determining its net cost of operations. If such exchange revenue is retained by the entity, it should be recognized as a financing source in determining the entity's operating results. If, instead, such revenue is collected on behalf of other entities (including the U.S. Government as a whole), the entity that collects the revenue should account for that revenue as a custodial activity, i.e., an amount collected for others.

45.2. If the collecting entity transfers the exchange revenue to other entities, similar recognition by other entities is appropriate.

a. If the other entities to which the revenue is transferred also recognize virtually no costs in connection with the Government earning the revenue, the amounts transferred to them should not offset their gross cost in determining their net cost of operations but rather should be recognized as a financing source in determining their operating results.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

b. If the other entities to which the revenue is transferred do recognize costs in connection with the Government earning the revenue, the amounts transferred to them should offset their gross cost in determining their net cost of operations.

45.3. Because the revenue is exchange revenue regardless of whether related costs are recognized, it should be recognized and measured under the exchange revenue standards.

DISCLOSURES AND OTHER ACCOMPANYING INFORMATION

46. Each reporting entity that provides goods or services to the public or another Government entity should disclose the following:

(a) differences in pricing policy from the full cost or market pricing guidance for exchange transactions with the public as set forth in OMB Circular No. A-25, *User Charges* (July 8, 1993), or in subsequent amendments in circulars that set forth pricing guidance;

(b) exchange transactions with the public in which prices are set by law or executive order and are not based on full cost or on market price;[4]

(c) the nature of intragovernmental exchange transactions in which the entity provides goods or services at a price less than the full cost or does not charge a price at all, with explanations of the amount and reason for disparities between the billing (if any) and the full cost; and

(d) the full amount of the expected loss when specific goods are made to order under a contract, or specific services are produced to order under a contract, and a loss on the contract is probable (more likely than not) and measurable (reasonably estimable).

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

47. When making the disclosures called for by (a) and (b) in paragraph 0, cautionary language should be added to the effect that higher prices based on full cost or market price might reduce the quantity of goods or services demanded and, therefore, the difference between revenue received and such higher prices does not necessarily provide an indication of revenue forgone. If a reasonable estimate is practicable to make, the entity should provide as other accompanying information the amount of revenue forgone and should explain whether, and to what extent, the quantity demanded was assumed to change as a result of a change in price.

NONEXCHANGE REVENUE

RECOGNITION AND MEASUREMENT OF NONEXCHANGE REVENUE

The General Standard

48. Nonexchange revenues are inflows of resources that the Government demands or receives by donation. Such revenue should be recognized when a specifically identifiable, legally enforceable claim to resources arises, to the extent that collection is probable (more likely than not) and the amount is reasonably estimable. Nonexchange revenue should be **measured** by the collecting entities, but should be **recognized** by the entities legally entitled to the revenue (the recipient entities). Paragraphs 0 through 0 describe the application of this general standard.

Taxes and Duties

49. **Revenue measured by the collecting entities.** Taxes and duties also should be measured on the cash basis, and the cash basis amount(s) should be shown in conjunction with the accrual amounts recognized. The source and disposition of revenue

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

from taxes, duties (which are a type of tax), and related fines, penalties and interest should be measured by the collecting entities in a manner that enables reporting of (1) cash collections, refunds, and the "accrual adjustment" necessary to determine the total revenue and (2) cash or cash equivalents transferred to each of the recipient entities and the revenue amounts to be recognized by each of them. The collecting entities function in a custodial capacity with respect to revenue transferred or transferable to the recipient entities. The collecting entities should not recognize such revenue, but should account for and report upon the above mentioned custodial activities. The entities that collect taxes and duties may change the general standard (para. 0) to accrue amounts now required to be presented as supplementary information (paragraphs 0 and 0) and make other changes that would result in a fuller and more complete application of accrual accounting.

50. **Cash collections** should be based on amounts actually received during the fiscal period, including withholdings, estimated payments, final payments, and collections of receivables. Cash collections include any amounts paid in advance of due dates unless they are deposits.

51. **Cash refunds** should be based on repayments of taxes and duties during the period. Refunds include refund offsets and drawbacks. Refund offsets are amounts withheld from refunds on behalf of other agencies and paid to such agencies. Drawbacks are refunds of duties paid on imported goods that are subsequently exported or destroyed.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

52. **The "accrual adjustment,"** which modifies the net of cash collections and refunds to determine the amount of revenue recognized, should be the net increase or decrease during the reporting period in net revenue-related assets and liabilities. The net revenue-related assets and liabilities include accounts receivable, the allowance for uncollectible accounts, and amounts payable for refunds. Recognition standards for these accounts of the collecting entities are described in paragraphs 0 to 0.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

53. **Accounts receivable** should be recognized when a collecting entity establishes a specifically identifiable, legally enforceable claim to cash or other assets through its established assessment processes to the extent the amount is measurable. This definition of accounts receivable from nonexchange transactions requires the standard for recognition of accounts receivable to be amended so that such receivables are not recognized on the basis of payment due dates but rather on the basis of the completion of the assessment processes.[5] Under such processes, assessments are enforceable claims for which specific amounts due have been determined and the person(s) or entities from whom the tax or duty is due have been identified. Assessments include both self-assessments made by persons filing tax returns or entry documents and assessments made by the collecting entities.

54. Assessments recognized as accounts receivable include tax returns filed by the taxpayer (or customs documents filed by the importer) without sufficient payments, taxpayer agreements to assessments at the conclusion of an audit or to a substitute for a return (or importer agreements to supplemental assessments), court actions determining an assessment, and taxpayer (or importer) agreements to pay through an installment agreement or through accepted offers in compromise. Receivables determined to be currently not collectable are included, but assessments where there is no future collection potential such as where the taxpayer (or importer) has been either insolvent or deceased for specified periods are not included. Accounts receivable, therefore, include only unpaid assessments made through the end of the period plus related fines, penalties, and interest. Accounts receivable do not include amounts received or due with tax returns received after the close of the reporting period or amounts that are compliance assessments[37] or pre-assessment work in process.

55. **Compliance assessments and pre-assessment work in process.** Compliance assessments and pre-assessment work in process may or may not be legally assessed depending on the resolution of subsequent events.

---

[37] Customs refers to "compliance assessments" as protested assessment amounts.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

55.1. **Compliance assessments** are proposed assessments by the collecting entity in definitive amounts, but the taxpayer (or importer) still has the right to disagree or object, such as in the case of assessments made at the conclusion of an audit (or at the conclusion of a review by an import specialist or when a violation of applicable law is discovered), or the issuance by IRS of a substitute for a return, or where assessment is in appeals or in the tax court. These compliance assessments may become accounts receivable if the taxpayer files an amended return (or Customs' protest/retention period lapses), or an appeal or court action finally determines the assessment, or the taxpayer (importer) agrees to pay currently or through an installment agreement, or an offer in compromise is accepted.

55.2. **Pre-assessment work in process** is assessments not yet officially asserted by the collecting entity which are subject to a taxpayer's right to conference in response to initial information notices, e.g., revenue agent reports (or are unasserted assessments on merchandise released into commerce for which the importer did not submit an entry summary document or for projected revenues due as a result of Customs' compliance measurement programs). The amount or range of amounts that will ultimately be assessed or the duration of the notice period may be reasonably estimable, but there are no amounts for pre-assessment work in process presently included in the dollar based accounting systems. Estimates of the amount or range of amounts of pre-assessment work in process that may ultimately be collectable are not presently sufficiently reliable to be recognized.

56. **Allowance for uncollectible amounts** should be recognized based on an analysis of both individual accounts receivable and groups of accounts receivable, as prescribed by other standards.[38] A

[38] SFFAS No. 1, Accounting for Selected Assets and Liabilities, para. 44 to 51, provides the basis for determining this allowance.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

provision to increase or decrease the allowance will result in an adjustment of nonexchange revenue, rather than a bad debt expense.

57. **Amounts payable for refunds** (including refund offsets and drawbacks) should be recognized when measurable and legally payable under established processes of the collecting entities. The amounts include those refunds, where returns (or claims for refund) have been filed by the taxpayer and the Government has determined the specific amounts refundable and has identified the payee. Refunds with respect to returns or claims filed as of the end of the reporting period that do not require specific approval before payment are included in accounts payable for refunds.

58. **Other claims for refunds.** Claims filed for which specific administrative actions are required before payments can be made and unasserted claims for refund by taxpayers or importers that may or may not become payable depending upon the resolution of subsequent events.

58.1. Claims filed for refunds where required administrative actions are not yet complete as of the close of the reporting period are not recognized. The refunds, however, may be reasonably estimable.

58.2. Unasserted claims for refund such as unfiled claims for refunds or drawbacks for which no claim has been filed, are not recognized.[39] These amounts may be reasonably estimable, but are not presently included in dollar-based accounting systems.

[39] Future income taxes from corporations may be reduced by more than $100 billion dollars as a result of net operating loss carryforwards and tax credit carryforwards. Information in returns filed by corporations and in their financial statements appears to provide the basis for a reasonable estimate of the amount of potential reduced future income tax revenue attributable to these provisions of tax law. Information about net operating loss carryforwards is not an unasserted claim, as defined here.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

59. **Deposits**. Amounts voluntarily paid to the reporting entities as deposits, such as those made to stop the accrual of interest or those made pending settlements and judgments, are separately recognized as deposit liabilities.

60. **Revenue recognized by the recipient entities** should equal the sum of (a) cash or cash equivalents transferred to them by collecting entities and (b) the net change in any related inter-entity balances between the collecting and receiving entities (i.e., the amount to be transferred to the recipient entities from the collecting entity or vice versa). Equivalents are normally special Treasury securities issued by the Treasury Department acting in conjunction with the collecting entities. Inter-entity balances of amounts to be transferred normally should be recognized when (1) a legally enforceable claim exists between a collecting entity and a recipient entity for the transfer or repayment of taxes or duties, and (2) payment of such claim is probable and measurable. Inter-entity balances typically represent estimated settlements of transfers made during the period and revenue received by the collecting entity at year end but not yet transferred. Revenue should be recognized as a financing source in calculating the results of operations and not as a deduction in determining net cost of operations. Principles for the application of this standard to major groups of recipient entities are described in paragraphs 0 through 0.

60.1. **Trust funds legally entitled to excise taxes collected**. Certain trust funds are legally entitled to receive only excise taxes that are actually collected by the collecting entity. However, transfers to such trust funds currently are based on assessed excise taxes, because data on the components of cash collections by type of tax are not currently obtained from taxpayers. This standard affirms that revenues may be recognized on the basis of assessed excise taxes in lieu of excise taxes actually collected.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

60.2. **Trust funds legally entitled to receive Social Security taxes accrued.** By law, the trust funds are to receive Social Security taxes on the basis of the earnings of participants and the applicable tax rates. Social Security taxes accrued are presently determined by the assessment processes of the Internal Revenue Service (IRS). Non-compliance by taxpayers may result in such amounts being less than taxes based on actual earnings of participants. Amounts for individual participants are separately reported to the Social Security Administration (SSA), but because of employer reporting deficiencies these amounts are currently even less than amounts determined by the IRS. SSA is legally entitled to retain the higher amounts actually transferred by the IRS. This standard affirms that revenue should be recognized on the basis of the best available information, i.e., on the basis of the higher of the amount determined by the IRS assessment process or the individual participant amounts based on reports to SSA of participants' earnings, subject to any later adjustments necessary to bring the amounts transferred to the trust funds up to the amount of taxes due based on the actual earnings history of the participants.

60.3. **Collecting entities entitled to retain revenue.** When legally retained by the collecting entity as a reimbursement of the cost of collection, revenue should be recognized as an exchange revenue and deducted in determining the collecting entity's net cost of operations.

60.4. **General Fund.** The General Fund recognizes all nonexchange revenue not recognized by trust funds and other recipient entities. Interest on delinquent taxes should be recognized as exchange revenue. The General Fund should recognize in succeeding periods revenue adjustments for any recognized revenue that is determined after the books are closed for the period to have been properly transferable (or improperly transferred) to other recipient entities.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Fines and Penalties

61. Fines and penalties are monetary requirements imposed on those who violate laws or administrative rules. They may be imposed by the entities collecting taxes and duties, or by other government entities. The time when a claim to resources arises will depend on the nature of the fine and the associated legal and administrative processes. Some examples of conditions that, depending on the circumstances, could establish a legally enforceable and measurable claim include (1) the date by which an individual may contest a court summons expires, (2) the offender pays the fine before a court date, or (3) the court imposes the fine. An allowance for uncollectible accounts should, as in the case of taxes and duties, be recognized as a revenue adjustment and determined in accordance with other standards.[6] The allowance should reduce the gross amount of the receivable and revenue to its net realizable value, based on the criterion that losses should be recognized to the extent it is probable (more likely than not) that some or all of the receivables will not be totally collected.

Donations

62. Donations are contributions to the government, i.e., voluntary gifts of resources to a government entity by a nonfederal entity. Donations may be financial resources, such as cash or securities, or nonfinancial resources such as land or buildings. Revenue arising from donations should be recognized for those inflows of resources which meet recognition criteria for assets[7] and should be measured at the estimated fair value of the contribution.

Other Nonexchange Revenue

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

63. The various types of nonexchange revenue are described in Appendix B: Guidance for the Classification of Transactions. Some of these are not specifically mentioned in this standard. They should be recognized and measured in accordance with the general rule (see para. 0) except where other Board standards apply.

DISCLOSURES, SUPPLEMENTARY INFORMATION, AND OTHER ACCOMPANYING INFORMATION

Disclosures

64. **Basis of Accounting**. Collecting entities should disclose the basis of accounting when the application of the general rule of paragraph 0 results in a modified cash basis of accounting. The disclosure should point out the specific potential accruals which are not made as a result of this practice and the practical and inherent limitations affecting the accrual of taxes and duties. The disclosure should refer to the related other required disclosures and to the supplementary information and should mention that other accompanying information also provides related information. If a collecting entity adopts accounting standards that embody a fuller application of accrual accounting concepts, as permitted in paragraph 0, then the disclosure should describe that change in accounting and point out how it differs from that prescribed by this standard.

65. Entities that collect taxes and duties should disclose the following relating to future cash flows, revenue-related transactions, and custodial responsibilities:

65.1. **Accounts receivable.** Factors affecting collectability and timing of categories of accounts receivable and the amounts involved.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

65.2. **Material revenue-related transactions.** Revenue-related transactions affecting the beginning and end-of-period balances of accounts receivable, accounts payable for refunds, and the allowance for uncollectible amounts should be disclosed. All material types of revenue transactions which relate to the custodial responsibilities of the collecting entities should be disclosed. The disclosure should be comprehensive enough to include as a minimum: self-assessments by taxpayers (or importers); assessments by the entity; penalties; interest; cash collections applied to taxpayer accounts and unapplied collections; refunds, refund offsets, and drawbacks; abatements; accounts receivable written off during the reporting period as uncollectible; and provisions made to the allowance for uncollectible amounts.

65.3. **Cumulative cash collections and refunds by tax year and type of tax.** Cash collections and refunds by tax year and type of tax should include cash collections and cash refunds for the reporting period and for sufficient prior periods to illustrate (1) the historical timing of tax collections and refunds, and (2) any material trends in collection and refund patterns. Sufficient prior periods for each type of tax are the periods which end when the statutory period for collection ends. Collecting entities may shorten these periods if evidence for prior tax years indicates that a shorter period would reflect at least 99 percent of the collectible taxes.

66. If trust fund revenues are not recorded in accordance with applicable law, both the collecting and recipient entities should disclose the reasons.

Supplementary Information

67. Entities that collect taxes and duties should provide the following supplementary information relating to their potential revenue and custodial

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

responsibilities:

67.1. The estimated realizable value, as of the end of the reporting period, of compliance assessments and, if reasonably estimable, pre-assessment work in process. The amounts furnished should represent management's best estimate of additional revenues likely to be collected from compliance assessments and from pre-assessment work in process, appropriately qualified as to their reliability. A range of amounts may be provided for pre-assessment work in process if estimable. The change in the total(s) of compliance assessments and of pre-assessment work in process during the reporting period also should be provided.

67.2. If reasonably estimable, other claims for refunds that are not yet accrued but are likely to be paid when administrative actions are completed. If estimated, unasserted claims for refunds should be provided separately from claims filed and may be expressed as a range of amounts. The amounts furnished should represent management's best estimates, appropriately qualified as to their reliability. The change in the total of these amounts during the reporting period also should be provided.

67.3. The amount of assessments that the entity still has statutory authority to collect at the end of the period, but that have been written off and thus excluded from accounts receivable.

67.4. If reasonably estimable, the amounts by which trust funds may be over- or under-funded in comparison with the requirements of law.

68. Recipient entities that are trust funds should provide the same information as required for collecting entities in para. 0.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Other Accompanying Information

69. The following guidance for other accompanying information is intended to provide flexibility to enable preparers to present the most relevant information with respect to these topics, considering the needs and interests of users and the availability of data.

69.1. **A perspective on the income tax burden.** The IRS should provide a perspective on the income tax burden. This could take the form of a summary of the latest available information on the income tax and on related income, deductions, exemptions, and credits for individuals by income level and for corporations by size of assets. The objective is to show the tax burden borne by different classes of individuals and corporations and how that burden is affected by the tax rates, deductions, credits, etc., provided by the tax laws.

69.2. **Available information on the size of the tax gap.** Collecting entities should provide any relevant estimates of the annual tax gap that become available as a result of federal government surveys or studies. The tax gap is defined as taxes or duties due from non-compliant taxpayers or importers. Amounts reported should be specifically defined, e.g., whether the tax gap includes or excludes estimates of taxes due on illegally earned revenue. Appropriate explanations of the limited reliability of the estimates also should be provided. Cross references should be made to portions of the tax gap due from identified non-compliant taxpayers which are shown as supplementary information, i.e., compliance assessments and pre-assessment work in process (para. 0).

69.3. **Tax expenditures related to entity programs.** Information on tax expenditures that a reporting entity considers relevant to the performance of its programs may be presented, but should be qualified and explained appropriately to

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

help the reader assess the possible impact of specific tax expenditures on the success of the related programs.

69.4. **Directed flows of resources related to entity programs.** Information on directed flows of resources related to an entity's programs may be presented, but if this information is presented the estimated amounts should be accompanied by a description of the basis for the estimates and appropriate cautionary language about their reliability. Information should also be appropriately qualified and explained to help the reader assess the possible impact on the success of the programs.

OTHER FINANCING SOURCES

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

70. Financing sources, other than exchange and nonexchange revenues, that provide inflows of resources that increase results of operations during the reporting period include appropriations used, transfers of assets from other Government entities, and financing imputed with respect to any cost subsidies.[8] Financing outflows may result from transfers of the reporting entity's assets to other Government entities or from exchange revenues earned by the entity but required to be transferred to the General Fund or another Government entity. Unexpended appropriations are recognized separately in determining net position but are not financing sources until used.

RECOGNITION AND MEASUREMENT OF OTHER FINANCING SOURCES

Appropriations

71. **Unexpended Appropriations.** Appropriations, until used, are not a financing source. They should be recognized in capital as "unexpended appropriations" (and among assets as "funds with Treasury") when made available for apportionment, even if a Treasury Warrant has not yet been received, or the amount has not been fully apportioned. Unexpended appropriations should be reduced for appropriations used and adjusted for other changes in budgetary resources, such as rescissions and transfers. The net increase or decrease in unexpended appropriations for the period should be recognized as a change in net position of the entity.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

72. **Appropriations Used.** When used, appropriations should be recognized as a financing source in determining net results of operations.[9] Appropriations are used in operations when goods and services are received or benefits and grants are provided. Goods and services (including amounts capitalized) are considered received when a liability is established. Benefits are considered to be provided when the related liability is established. Grants are considered to be provided when grantees meet the requirements that allow them to use the grants.[40]

Financing Imputed for Cost Subsidies

73. Government entities often receive goods and services from other Government entities without reimbursing the providing entity for all the related costs. In addition, Government entities often incur costs, such as for pensions, that are paid in total or in part by other entities. These constitute subsidized costs to be recognized by the receiving entity to the extent required by other accounting standards. An imputed financing source should be recognized equal to the imputed cost. This offsets any effect of imputed cost on net results of operations for the period.

Transfers of Assets

74. An intragovernmental transfer of cash or of another capitalized asset without reimbursement changes the resources available to both the receiving entity and the transferring entity. The receiving entity should recognize a transfer-in as an additional financing source in its result of operations for the period. Similarly, the transferring entity should recognize the transfer-out as a decrease in its result of operations. The value recorded should be the transferring entity's book value of the asset. If the receiving entity does not know the book value, the asset should be recorded at its estimated fair value as of the date of transfer.

[40] FASAB plans to undertake a project on accounting for grants.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

75. To the extent that a Government entity's exchange revenue that is included in calculating net cost of operations is required to be transferred to the Treasury or another Government entity, the amount should be recognized as a transfer-out[10] in determining the net result of operations.

PRIOR PERIOD ADJUSTMENTS

76. Prior period adjustments should be limited to corrections of errors and accounting changes with retroactive effect, including those occasioned by the adoption of new federal financial accounting standards, and should be recognized and measured under applicable standards. Adjustments should be recognized as a change in cumulative results of operations (rather than as an element of net results of operations for the period). Prior period financial statements should not be restated for prior period adjustments recognized in the current period.

BUDGETARY INFORMATION

77. The budget is the primary financial planning and control tool of the government. For this reason, and because of the importance of this information to users of federal financial information, the following material budgetary information should be presented by reporting entities whose financing comes wholly or partially from the budget:

(a) total budgetary resources available to the reporting entity during the period;

(b) the status of those resources (including "obligations incurred");

(c) outlays.

78. Recognition and measurement of budgetary resources should be based on budget concepts and definitions contained in OMB Circulars A-11 and A-34. In addition, the reporting entity should provide this information for each of its major budget accounts as supplementary information. Small budget accounts may be aggregated.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

79. The following information about the status of budgetary resources should be disclosed.

(a) the amount of budgetary resources obligated for undelivered orders at the end of the period;

(b) available borrowing and contract authority at the end of the period;

(c) repayment requirements, financing sources for repayment, and other terms of borrowing authority used;

(d) material adjustments during the reporting period to budgetary resources available at the beginning of the year and an explanation thereof;

(e) existence, purpose, and availability of permanent indefinite appropriations;

(f) information about legal arrangements affecting the use of unobligated balances of budget authority such as time limits, purpose, and obligation limitations;

(g) explanations of any material differences between the information required by paragraph 0 and the amounts described as "actual" in the Budget of the United States Government;

(h) the amount, and an explanation that includes identification of balance sheet components, when recognized unfunded liabilities do not equal the total financing sources yet to be provided; and

(i) the amount of any capital infusion received during the reporting period.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

80. Budgetary and financial accounting information are complementary, but both the types of information and the timing of their recognition are different, causing differences in the basis of accounting. To better understand these differences, a reconciliation should explain the relationship between budgetary resources obligated by the entity during the period and the net cost of operations. It should reference the reported "obligations incurred" and related adjustments as defined by OMB Circular A-34. It also should include other financing sources not included in "obligations incurred" such as imputed financing, transfers of assets, and donations of assets not included in budget receipts. Further, it should include decreases (increases) in receivables from the public related to exchange revenue when only the cash amount is included in budgetary resources. The total of these items comprises obligations and nonbudgetary resources.

81. This total should then be adjusted by:

(a) Resources that do not fund net cost of operations (e.g., changes in undelivered orders, appropriations received to pay for prior period costs, capitalized assets),

(b) Costs included in net cost of operations that do not require resources (e.g., depreciation and amortization expenses of assets previously capitalized), and

(c) Financing sources yet to be provided (those becoming available in future periods which will be used to finance costs recognized in determining net cost for the present reporting period).

82. The adjustments should be presented and explained in appropriate detail and in a manner that best clarifies the relationship between the obligations basis used in the budget and the accrual basis used in financial (proprietary) accounting.

ACCOUNTABILITY FOR DEDICATED COLLECTIONS

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

83. A reporting entity may be responsible for funds financed with dedicated collections that are held for later use to accomplish the fund's purpose. Some of these are held in a fiduciary capacity. Special accountability is required for the sake of the taxpayers or other contributors who make payments to the fund with the expectation that the collections will be used for the purposes for which they were dedicated, and for the sake of those who expect to benefit from the fund's future expenditures. Such funds include all funds within the budget classified as trust funds, those funds within the budget that are classified as "special funds" but that are similar in nature to trust funds, and those funds within the Federal universe (inside or outside the budget) that are fiduciary in nature. Management should, therefore, identify those special funds that are similar in nature to trust funds and those funds inside and outside the budget that are fiduciary in nature. Identification of funds that are similar in nature to trust funds is a judgmental matter; management is best qualified to make this judgment.

84. Separate financial information about these dedicated collections should be provided if they are material either to the reporting entity or to the beneficiary or contributors. The separate information may be reported on the face of the entity's general purpose financial statements, or the information may be disclosed in the notes to the financial statements. When not material to the reporting entity, this information may be provided separately in special reports to the contributors and beneficiaries (or their representatives) rather than separately in the reporting entity's general purpose financial statements or notes thereto.

85. The following information, at a minimum, should be reported for individual funds that account for dedicated collections.

(a) A description of each fund's purpose, how the administrative entity accounts for and reports the fund, and its authority to use those collections.

(b) The sources of revenue or other financing for the period and an explanation of the extent to which they are inflows of resources to the Government or the result of intragovernmental flows.

(c) Condensed information about assets and liabilities showing

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

investments in Treasury securities, other assets, liabilities due and payable to beneficiaries, other liabilities, and fund balance.

(d) Condensed information on net cost and changes to fund balance showing revenues by type (exchange/nonexchange), program expenses, other expenses, other financing sources, and other changes in fund balance.

(e) Any revenues, other financing sources, or costs attributable to the fund under accounting standards, but not legally allowable as credits or charges to the fund.

When the above information is provided separately in special reports, as described in paragraph 0, the financial information required in (c) and (d) above should be combined for all such funds and the information described as "amounts for immaterial funds not presented separately in this general purpose report."

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

86. The law may require the accounting for a fund to be done in a particular way. The disclosures called for by item (e) are required if the fund's recognition requirements, as determined by law, are contrary to applicable accounting standards with respect to certain revenue, other financing sources, or costs. For example, a trust fund may be required to recognize revenue based on cash collected by the Government during the reporting period rather than the accruals due the Government. In the case of some funds, payments from the fund are also subject to legal limitations. Although the accounting used within the fund itself should be in accordance with the applicable legal requirements, the larger reporting entity of which the fund is a component, the administrative entity, or the next higher level of the Government (e.g., a department or the governmentwide entity), should recognize the revenues, other financing sources, or costs associated with but not legally allowable to the fund.[11]

87. Most dedicated collections are included in the financial statements of the entity carrying out the program and responsible for administration of the fund. However, this may not be the case where collections are outside the budget or are not otherwise included in the reporting entity under the concepts of Entity and Display. In either case, the information is required to be disclosed. If more than one reporting entity is responsible for carrying out the program financed with the dedicated collections, then the entity with the largest share of the activity should be responsible for reporting all revenues, other financing sources, assets, liabilities, and costs of the fund.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

PART II: CONCEPTS FOR RECONCILING BUDGETARY AND FINANCIAL ACCOUNTING

INTRODUCTION

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

88. The Statement of Federal Financial Accounting Concepts (SFFAC) No. 2, Entity and Display, was issued to provide conceptual guidance as to what would be encompassed by a federal entity's financial report. It identifies the types of financial information to be communicated to users and suggests the types of information to be included in an entity's report to help meet the objectives of federal financial reporting. Among other things, SFFAC No. 2 supports reporting both budget information and operating performance (i.e., proprietary) information to meet the needs of users and the objectives of reporting. The budget information focuses on the obligation and outlay of financial resources to acquire or provide goods and services as defined by budget concepts. Operating performance information focuses on the cost of resources used as defined by accrual accounting standards.

89. Budgetary and financial accounting information are complementary, but both the types of information and the timing of their recognition is necessarily different because of the difference in focus. To better understand the differences and make better use of the complementary information provided, information needs to be provided to reconcile the use of budgetary resources to acquire or provide goods and services with the net cost of using those goods and services. An approach to doing this was explored in the exposure draft, Accounting for Revenue and Other Financing Sources, and received substantial support from respondents. Therefore, Entity and Display is being amended to include in its concepts the need to communicate information about the differences between the use of resources as reported in the budget and in the net cost of operations.

AMENDMENTS TO SFFAC No. 2, ENTITY AND DISPLAY

90. The following heading and two paragraphs (numbered 0 and 0 in this document) are added to the section of SFFAC No. 2 titled "Displaying Financial Information."

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

RECONCILIATION STATEMENT--BUDGETARY AND FINANCIAL ACCOUNTING

91. Subobjective 1C of the budgetary integrity objective states that information is needed to help the reader to determine "how information on the use of budgetary resources relates to information on the costs of program operations and whether information on the status of budgetary resources is consistent with other accounting information on assets and liabilities." This objective arises because accrual-based expense measures used in financial statements differ from the obligation-based measures used in the budgetary reports.

92. To satisfy this objective, information is needed about the differences between budgetary and financial (i.e., proprietary) accounting that arise as a result of the different measures. This could be accomplished through a **Statement of Financing** that reconciles the budgetary resources obligated for a federal entity's programs and operations to the net cost of operating that entity. The data presented could be for the reporting entity as a whole, for the major suborganization units, for major budget accounts, or for aggregations of budget accounts, rather than for each individual budget account of the entity.

93. The Statement of Financing is added to SFFAC No. 2's suggested list of items included in the section titled "Financial Reporting for an Organizational Entity." In addition, a footnote (referenced to the Statement of Financing) shall be added stating:

OMB will provide guidance regarding details of the display for the Statement of Financing, including whether it shall be presented as a basic financial statement or as a schedule in the notes to the basic financial statements.

94. The following heading and paragraphs (numbered 0 through 0 in this document) are added to the section of SFFAC No. 2 titled "Recommended Contents for the Recommended Displays."

STATEMENT OF FINANCING

95. The purpose of the Statement of Financing is to explain how budgetary resources obligated during the period relate to the net cost of operations for that reporting entity. This information should be presented in a way that clarifies the relationship between the obligation basis of budgetary

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

accounting and the accrual basis of financial (i.e., proprietary) accounting. By explaining this relationship through a reconciliation, the statement provides information necessary to understand how the budgetary (and some nonbudgetary) resources finance the cost of operations and affect the assets and liabilities of the reporting entity. The appropriate elements for the Statement of Financing would be as indicated in the following paragraphs. They provide logical groupings of reconciling items that help the reader move from obligations to net cost of operations.

96. **Obligations incurred** are amounts of new orders placed, contracts awarded, services received, and other similar transactions during the period that will require payments during the same or a future period. A deduction is needed for spending authority from offsetting collections and recoveries of prior period obligations.

97. **Nonbudgetary resources** represent the net amount of resources received by the entity that are not included in budgetary resources. These items could include donations of assets, transfers of assets from (to) other federal entities, and financing imputed for cost subsidies. This amount would also include decreases (increases) in receivables related to revenue accrued from the public because, while the cash collected for exchange revenue is a budgetary resource, the accrual amount is not.

98. **Resources that do not fund net cost of operations** are primarily (a) the change in amount of goods, services, and benefits ordered but not yet received or provided, (b) amounts provided in the current reporting period that fund costs incurred in prior years, and (c) amounts incurred for goods or services that have been capitalized on the balance sheet.

99. **Costs that do not require resources** are most commonly the result of allocating assets to expenses over more than one reporting period (e.g., depreciation) and the write-down of assets (due to revaluations).

100. **Financing sources yet to be provided** are the financing amounts needed in a future period to cover cost incurred in the current period.

101. The bottom line of this reconciliation would be the **net cost of operations**.

102. The following example financial statement format will be added to the appendices of SFFAC No. 2:

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

APPENDICES

APPENDIX A: BASIS FOR CONCLUSIONS

103. This appendix does not constitute authoritative guidance for those who prepare and audit general purpose federal financial reports. It summarizes important considerations that FASAB members considered as they deliberated on this Statement. It includes reasons for accepting certain approaches and rejecting others. Individual Board members gave greater weight to some factors than to others.

104. FASAB published the exposure draft Accounting for Revenue and Other Financing Sources in July 1995. The exposure draft included 18 specific questions for respondents and invited comments on other topics. The Board received 42 letters of comment from the following sources:

SOURCE
USERS, ACADEMICS & OTH
AUDITORS
PREPARERS
TOTALS

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

105. FASAB also held a public hearing on the exposure draft on September 20, 1995. One individual (a professor of accounting), representatives of four federal organizations that prepare financial statements, and representatives of one federal audit organization presented comments and discussed the exposure draft with the Board. Most of those who commented orally or in writing supported most of the provisions of the exposure draft. Most responses did suggest widening the proposed disclosures for trust funds to include other funds with similar special accountability for dedicated collections. Also, most respondents suggested retaining the customary business practice of recognizing bad debt expense for credit losses from exchange transactions. The Board made these changes. (See paragraph 0 for details on the change regarding credit losses. See paragraphs 0 and following for details on the change regarding disclosures for trust funds and similar funds). Concurrently with the widening of disclosures about funds, the Board required disclosures and supplementary information about any over- and under-funding of the trust funds (see para. 0, 0 and 0). The Board also made other less material changes in the exposure draft as a result of considering the comments it received.

106. As a result of further information received from IRS following the exposure draft, the Board made terminology changes with respect to "pre-assessments," now referred to as "compliance assessments," and "proposed assessments, now called "pre-assessment work in process." More importantly, the Board provided for the possibility that amounts for pre-assessment work in process might not be reasonably estimable (see para. 0). As a result of further information from Customs following the exposure draft, the Board added a supplementary information requirement for unasserted claims for refund (see para. 0. (These include potential drawbacks that may approximate 20% of Customs reported revenue.)

107. After some deliberation, the Board also

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

concluded that it would permit a fuller application of accrual accounting for taxes and duties than is required by the general rule (see para. 0). This would apply in the interim period between the issuance date of the Statement and any reconsideration of the standard by the Board. Coincident with extending the effective date of the standard for one year beyond that proposed in the exposure draft, and because of the importance of accurate information, the Board decided to require that material revenue-related transactions should be accounted for under a double entry accounting system (rather than estimated) and changed the designation of this information from supplementary to disclosure information (see para. 0 and 0).

108. Finally, the Board recognized that, under certain circumstances, reporting entities may appropriately report information about tax expenditures and directed flows of resources that are related to their programs. However, the standard only permits this information to be presented as other accompanying information if it is properly qualified and explained (see para. 0 and 0).

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

EXCHANGE REVENUE

Special Nature of Government Exchange Transactions

109. Revenue from exchange transactions plays a different role in Government than in private business. Most Government output is provided to the public directly as the result of political decisions rather than in exchange for revenue. This is regardless of whether the output is the provision of services, transfer payments to individuals, or grants to state and local governments. Likewise, most of the Government's receipts are collected as a result of exercising its power to compel tax payments rather than earned by providing goods and services to the public at a price.

110. Where Government goods and services are provided in exchange for revenue, prices may be set to cover cost. Sometimes they may be set in the market as they would be set by a business (such as auctioning the right to drill for oil on Government land). However, law or policy sets many prices below the amount that might be obtained in an auction or other market transaction (such as fees for grazing rights). In some of these cases, prices may be set with little or no regard to the related cost (such as fees to visit national parks).

111. Exchange transactions also occur between entities within the Government, sometimes as stipulated by law and in other cases by mutual agreement. These exchange transactions, also, are often not conducted at fair market prices. Services are often provided to a program free, such as the litigation the Department of Justice does for the Internal Revenue Service. Another common example is a central computer used without charge by several programs within an agency. Where charges are imposed, the internal sales price or reimbursement is not necessarily based on the full

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

cost of providing the goods or services or on competitive market equivalents.

112. Some exchange transactions within the Government are carried out by intragovernmental revolving funds. In many instances, these funds have been established with the goal of recovering their full cost by selling their output. This would allow them to be self-sustaining from their sales, including the maintenance of their capital, without the need for additional appropriations. Goods and services must be priced at full cost to achieve this goal, but full cost is not always charged. As a result, revolving funds have often failed to be self-sustaining and have required extra appropriations.[13]

Recognition: General Considerations

113. **Matching revenue with cost**. It is often said that private sector accounting matches expense with revenue to measure the net income of the business. This provides a measure of effort compared with accomplishment that cannot be used for most government activities. Most government activity either provides collective goods and service (such as national defense and justice) or redistributes income and wealth (as in benefit payments and grants). Therefore, the Government's output--its goods, services, transfers, and grants--is usually not provided in exchange for voluntary payments. In such cases, directly measuring the value that the Government's activity adds to society's welfare is difficult.

114. The Objectives of Federal Financial Reporting focuses on cost in relationship to accomplishment as the main objective in reporting an entity's operating performance. This is because of the fundamental importance of cost information. It is important to program managers in operating their activities efficiently and effectively. It is equally important to Executive and Congressional decision makers in making resource allocations. Subobjectives 2A and 2B declare that:

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

> Federal financial reporting should provide information that helps the reader to determine ...the costs of providing specific programs and activities and the components of, and changes in, these costs...[and] the efforts and accomplishments associated with federal programs and the changes over time and in relation to costs.[14]

115. The Board's explanation of the operating performance objective defines more exactly what this means:

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

> ...expenses can be matched against the provision of services year by year. The resulting cost can then be analyzed in relationship to a variety of measures of the achievement of results.[41]

116. SFFAS 4, Managerial Cost Accounting Concepts and Standards, discusses the need for Government accounting to emphasize cost as a way to improve decision making and program management. It says that good cost information can be used for: (1) budgeting and cost control, (2) performance measurement, (3) determining reimbursements and setting fees, (4) program evaluations, and (5) economic choice decisions (such as whether to contract-out a project).[42]

117. To meet these goals, cost must be matched with the provision of goods and services to the public or other Government entities. To determine the net cost of an exchange activity--i.e., the part of the cost that is not offset by revenue earned from the goods and services provided--the related revenue must be matched with the cost.

---

[41] Ibid., page 38, para. 124. For more extended discussion, see ibid., chapter 8. As explained there, difficulties arise in practice for many reasons, e.g., the specific measures that are appropriate and feasible will vary from program to program, outcomes are influenced by external factors as well as actions of government, focusing attention on selected measures can have unintended--and sometimes undesired--consequences, etc.

[42] SFFAS No. 4, Managerial Cost Accounting Concepts and Standards for the Federal Government, pp. 11-14.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

118. Matching revenue with cost in a uniform manner is essential in evaluating agency performance and setting price. Cost and revenue must pertain to the same output in order to estimate the extent to which the revenue covers the cost. Therefore, costs should be matched against the provision of goods and services with revenue matched against those costs and thus with revenue also matched against the same provision of goods and services. When this is done, the gross and net cost of an entity can be compared with the related outputs and outcomes to evaluate its operating performance, pricing policy, and economic decisions. Similarly, when this is done, the net cost to the taxpayer can be estimated for the entity's related outputs provided to the public.

119. The standards in this Statement therefore use the accrual basis for recognizing exchange revenue and provide for matching exchange revenue against related cost as closely as practicable. The standards specify how the matching is to be achieved for different types of transactions.

120. **Assigning revenue to the costs of earning it**. Determining the net cost of producing outputs, providing programs, or carrying out missions will often be more important than determining the net cost for the reporting entity as a whole. A reporting entity may have several missions carried out by different suborganizations, all of them having component programs and outputs. For each of these, both gross and net cost are important in evaluating performance and managing cost. Furthermore, either an entity as a whole or its suborganizations and programs may have material costs that are not incurred to earn revenue, as well as material costs that are incurred for that purpose. Therefore, the revenue-earning and nonrevenue-earning components need to be separately evaluated in order to assess the net cost of particular activities. Additionally, various components may earn revenue but cover costs to different degrees.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

121. In all these cases, the net cost of the reporting entity as a whole does not show the extent to which earned revenue covers the cost of providing a particular output. This can only be calculated for the entity's components. Determining the net cost for components is therefore essential to achieve the goals of the standards in this Statement: to match exchange revenue with the gross cost of outputs and to offset exchange revenue against that related gross cost.

122. To be most useful, therefore, the gross costs and net cost of operations should be calculated by suborganization, program, or output. Suborganizations are generally equivalent to responsibility segments as defined by the standards on managerial cost accounting.[43] Each responsibility segment must be able to assign full costs to the measurable outputs of its programs.[44] As a result, users of general purpose federal financial reports will be able to relate the net costs of a program to program outputs and outcomes.

123. Preparers should decide the exact classification of suborganizations and programs based on the nature of the entity, the missions and outputs for its GPRA strategic and annual performance plans, the concepts in Entity and Display, Federal accounting standards, and OMB's bulletin prescribing the form and content of agency financial statements. Exchange revenue should be assigned to the costs of outputs unless it is not reasonably possible to do so. If that cannot be done, exchange revenue should be assigned to the costs of programs, or, if that also is not reasonably possible, to the costs of suborganizations. Assigning exchange revenue to the components of an entity in this way is more

[43] See *ibid.*, pp. 31-35. Also see SFFAC No. 2, *Entity and Display*, pp. 25-26, para. 75 and footnote 14.

[44] SFFAS No. 4, *Managerial Cost Accounting Concepts and Standards for the Federal Government*, pp. 36-42 and 51-59.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

effective for performance evaluation, price setting, and other purposes than assigning it to the reporting entity as a whole.

124. The gross cost, the exchange revenue, and the difference or net cost should be determined for each such component. The net cost and gross cost for each component could be used for such purposes as comparison with the outputs and outcomes of that component in order to assess the efficiency and effectiveness with which resources were used to achieve results.[45]

125. Good information on gross cost and net cost, determined and analyzed in this manner, is essential to the success of the Government Performance and Results Act of 1993 (GPRA)[46] in relating costs to accomplishments. GPRA requires agencies to set performance goals for program activity and establish performance indicators to measure outputs and outcomes of the program activity. Performance measurement under GPRA is to begin in FY 1999, and pilot projects started in FY 1994. Under the OMB plan to carry out GPRA, performance reports will show the results of what was actually accomplished (outputs and outcomes) with the resources used. The net cost of operations (as well as gross cost) should be a fundamental measure of these resources.

[45] As noted previously, the specific measures of program economy, efficiency, and effectiveness that are feasible and appropriate will vary among programs.

[46] Public Law 103-62.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

126. **Uncollectible amounts**. When realization of the full amount of recognized revenue is not probable, the standards require that a separate provision be made if the uncollectible amount can be reasonably estimated. The Board defines "probable" as "more likely than not." This definition, and measurability, are the criteria for recognizing losses due to uncollectible amounts of accounts receivable under Federal accounting standards.[47]

127. Government entities have an extraordinary responsibility to be accountable--to the President, the Congress, and the public. Because of this, it is appropriate to show separately (1) the full revenue due under their established pricing arrangements, and (2) the amount of this revenue that they estimate will not be realized.

128. The Exposure Draft proposed that the entire provision for estimated uncollectible amounts be recognized as a revenue adjustment. It reasoned that, if some of the potential revenue is not likely to be received, this should be viewed as the failure to realize revenue or the absence of an inflow of resources. Some of the respondents also viewed the entire uncollectible amount as a shortfall in revenue, but a majority believed that credit losses were a cost of doing business. Businesses extend credit in order to finance their customers, and any losses in this line of activity are another kind of expense. Such treatment is required for direct loans and loan guarantees that follow the credit reform accounting standards of SFFAS No. 2. A particularly telling argument, made by some, was that credit losses should be a component of full cost when establishing prices for the sale of goods and services. This would be facilitated by recognizing credit losses as a bad debt expense rather than a revenue adjustment. For these reasons, the Board concluded that credit losses should be recognized as an expense.

[47] SFFAS No. 1, *Accounting for Selected Assets and Liabilities*, pp. 12 and 33-34, paragraphs 44-45 and 124-30.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

129. Uncollectible amounts due to other reasons--such as returns, allowances, and price redeterminations--would, however, be recognized as revenue adjustments. This treatment is parallel with the treatment in this Statement of taxes and other nonexchange revenue, where refunds, adjustments, and abatements are deducted from gross revenue rather than recognized as an expense. Under current practice and private sector standards, these uncollectible amounts are commonly treated as revenue adjustments but are not always separately disclosed.

130. The bad debt expense and the revenue adjustment each needs to be separately shown in order for the entity to be accountable for the different reasons why revenue is not collectible.

131. The allowance for bad debts should be based on an analysis of both individual accounts and groups of accounts, as appropriate under the circumstances. This principle is explained in the standard for accounts receivable.[48] For intragovernmental transactions, allowances for bad debts may not always be needed, because full payment can often be assumed.

Recognition: Special Cases

132. The general principles underlying exchange revenue recognition are supplemented for special cases.

133. **Gains and losses.** Gains and losses are recognized rather than revenues and expenses in order to differentiate unusual or nonrecurring transactions for evaluating an entity's performance or setting its prices. Material gains and losses are expected to be infrequent. They would normally be of a type that management would want to be considered in appraisals of its operations.

---

[48] *Ibid.*, pp. 12-13 and 34-35.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

134. **Direct loans and loan guarantees**. Standards for direct loans and loan guarantees were established in SFFAS No. 2, Accounting for Direct Loans and Loan Guarantees. The basic principle is to recognize the subsidy cost of the direct loan or loan guarantee as an expense when the loan is made. Subsidy cost is inherently a net concept: the present value of estimated cash outflows less the present value of estimated cash inflows over the life of the loan. This requires that the present value of estimated fees be recognized as a deduction in calculating subsidy cost, and that the present value of estimated defaults be included in calculating the subsidy cost. The standards for direct loans and loan guarantees that follow credit reform accounting thus differ from the standards in the present Statement in three respects: revenue is deducted in calculating the subsidy cost, bad debts are included in calculating the subsidy cost, and both revenue and bad debts are measured as present values.

135. Determining the subsidy cost in this way is a method of matching revenue with cost, and it is also a method of matching the subsidy cost with the provision of the subsidy to the public. SFFAS No. 2 is therefore consistent with the objectives of this Statement for exchange revenue, and the standards in this Statement do not apply to the recognition and measurement of revenue and credit losses for direct loans and loan guarantees that follow credit reform accounting. This exception includes pre-1992 direct loans and loan guarantees that have been restated on a present value basis. The guidance for classifying transactions in Appendix B reflects the provisions of SFFAS No. 2.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

136. **Exchange revenue collected for others**. Many entities that collect exchange revenue keep that revenue for their own use. Revolving funds keep the revenue they earn. By their nature, they are expected to finance at least a material part of their cost by selling goods and services in a continuing cycle of business-type activity. Other collecting entities may also keep the revenue they earn. Sometimes, however, the exchange revenue is transferred to the General Fund or to other entities in whole or in part. For example, the Southeastern and Southwestern Power Administrations transfer the revenue they collect from the public to the General Fund of the Treasury; similarly the Western Area Power Administration, while retaining some of the revenue that it collects, transfers the rest to the General Fund and various special funds designated by law.

137. As a general rule, exchange revenue transferred to others must be offset against the collecting entity's gross cost to determine its net cost of operations. Exchange revenue reduces the net cost of operations incurred by the entity in producing outputs, regardless of whether the entity keeps the exchange revenue for its own use or transfers it to another operating entity or the General Fund. Likewise, exchange revenue reduces the net cost of the entity’s operations to the taxpayer regardless of its disposition. Therefore, all exchange revenue related to the cost of operations must be deducted from gross cost to determine the net cost of operations for the entity.

138. Any exchange revenue that is transferred to others, however, does not affect the collecting entity's net position. Therefore, as required by the standards for other financing sources, such exchange revenue is recognized as a transfer-out in calculating the entity's operating results.

139. The only exception to the general rule occurs when the entity recognizes virtually no cost in

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

earning the exchange revenue, as explained in the following section.

140. **Exchange revenue unrelated to recognized cost.** In exceptional cases, an entity may recognize virtually no costs in connection with earning exchange revenue that it collects. A major example for many years has been the Minerals Management Service (MMS) of the Department of the Interior. It manages energy and other mineral resources on the Outer Continental Shelf (OCS) and collects rents, royalties, and bonuses due the Government and Indian tribes from minerals produced on the OCS and other Federal and Indian lands. The rents, royalties, and bonuses are exchange revenues, earned by sales in the market. If the value of natural resources were recognized as an asset by MMS, then depletion could be recognized as a cost according to the units of production method as minerals were extracted.[15] The revenue from rents, royalties, and bonuses could then be matched against MMS's gross cost, including depletion and minor other costs, to determine its net cost of operations.

141. MMS does not recognize a depletion cost for various reasons, including the fact that under present accounting standards the value of natural resources is not recognized as an asset. As a result, this exchange revenue cannot be matched against the economic cost of operations and bears little relationship to the recognized cost of MMS. Therefore, it should not be subtracted from MMS's gross cost in determining its net cost of operations. If it were subtracted, the relationship between MMS's net cost of operations and its measures of performance would be distorted. The net cost of operations of the Department of the Interior would likewise be distorted.

142. MMS collects this revenue acting as an agent for the recipients designated by law: the Treasury, certain entities within the Government to which amounts are earmarked, the states, and Indian tribes and allottees. Therefore, MMS should account for the exchange revenue as a custodial activity, which is an amount collected for others, in the same way as the Internal Revenue Service accounts for the nonexchange revenue that it collects. Because the revenue collected by MMS is exchange revenue, it

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

should be recognized and measured under the exchange revenue standards when the rents, royalties, and bonuses are due pursuant to the contractual agreements.

143. The rents, royalties, and bonuses transferred to Treasury for the General Fund or to other Government reporting entities should be recognized similarly by these recipient entities. The revenue is exchange revenue and should be recognized and measured under the exchange revenue standards. However, neither the Government as a whole nor the other recipient entities recognize the natural resources as an asset and depletion as a cost. Therefore, the revenue should not offset the cost of operations for the U.S. Government as a whole or for these entities. As in the case of MMS, offsetting cost by this revenue would distort the relationship between the net cost of operations and the measures of the performance of these entities. The exchange revenue should instead be a financing source in determining the operating results and change in net position.

144. The Board is addressing the accounting for natural resources in a separate project. If it concludes that the value of mineral rights should be recognized as an asset and depletion as a cost, it would be appropriate to recognize the exchange revenue from rents, royalties, and bonuses in determining the net cost of operations.

145. Although MMS is the most prominent case of an entity collecting exchange revenue for which it recognizes virtually no cost, there can be other instances. The Federal Communications Commission collects exchange revenue from the auction of the radio spectrum. Such revenue should be accounted for in the same way as the revenue collected by MMS.

146. One respondent to the Exposure Draft asked about the meaning of the term “virtually no costs.” If an entity sells scrap metal or fully depreciated equipment, the exchange revenue or gain is not related to any cost that is recognized at the time of sale. These assets are recorded on the balance sheet as having no value at the time of sale, so the gross proceeds from the sale are not offset by any remaining book value in calculating the entity’s gain. However, unlike the auctions of petroleum rights or the radio spectrum, costs were recognized in past periods for the purchase of the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

materials or the use of the equipment. Therefore, offsetting the entity's cost by its gains from sale provides a more accurate measure of its net cost of operations over time for comparison with measures of its performance over time. The standard has been clarified to say that the term "virtually no costs" means that virtually no costs are recognized during past periods as well as during the current period.

147. It is also possible that an entity's cost accounting may not assign any costs to byproducts of its major goods or services. However, cost is recognized for the activities that produced both the major products and the byproducts. All revenue earned in connection with these activities needs to be offset against the cost of these activities in determining the entity's net cost for the purpose of making comparisons with its measures of performance.

148. **Specific goods (or services) made to order compared with goods made for inventory**. When an entity produces goods for sale, revenue can be matched with cost in either of two ways: (1) revenue and expense can be recognized as costs are incurred, or (2) the expenditures can be recorded in inventory, with the revenue and expense recognized subsequently when the goods are delivered to the customer.

149. For specific goods made to order under a contract (or specific services produced to order), the standard requires that revenue be recognized as goods and services are acquired to fulfill the contract. More precisely, the standard requires that revenue, as determined by the contract price, be recognized in proportion to the estimated total cost as goods and services are acquired to fulfill the contract. This means that the percentage-of-completion method must be used and the amounts of revenue must be calculated based on the costs of the goods and services acquired to date to fulfill the contract in relationship to the estimated total cost under the contract. If the time period and estimated total cost are uncertain, revenue recognition should be deferred until a firm basis can be established to assign cost. Goods and services made (or produced) to order include such projects as building construction and ship repair, where costs are incurred over a period of time to provide a particular good or service to a specific customer according to characteristics determined by contract. They do not include the sale of standard services, such as electricity, under a contract.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

150. Recognizing revenue and cost in this way provides an up-to-date measure of the entity's operations in providing goods and services. The revenue and cost are generated by the entity's activities during the current reporting period, unlike alternative recognition standards. In particular, this is unlike the completed contract method, under which the revenue and cost recognized in a period may have been generated substantially during previous periods. Because the revenue and cost recognized in the reporting period are up-to-date, they can more readily be compared with each other and with current outputs in evaluating the entity's performance and pricing policy in that period.

151. In some instances, however, there may be no material difference between the percentage-of-completion method and the completed contract method. This is especially likely for small or short-term contracts. In such instances, the completed contract method could be followed.

152. The standard also requires that when a loss on a contract is probable (more likely than not) and measurable (reasonably estimable), it should be recognized over the life of the contract in proportion to the estimated total cost instead of immediately. This will come about by continuing to recognize revenue in proportion to estimated total cost and by continuing to recognize costs as goods and services are acquired to fulfill the contract. This requirement is an exception to SFFAS No. 5, Accounting for Liabilities of the Federal Government, under which a loss on a contract is recognized at the time when expected costs exceed expected revenue. The Board believes this exception is appropriate, because it provides a more accurate measure of the entity's net cost of operations during each reporting period than if the entire estimated loss were recognized in the single period when it was concluded that the loss was probable and measurable. The entire estimated loss, however, would be disclosed.

153. The standard is different when an entity produces goods to be kept "on the shelf" until ordered. It requires that manufacturing costs be charged to inventory and that revenue not be recognized until the goods are delivered to the customer. Costs and revenue are recognized later than when goods and services are made to order, because there is less assurance of revenue at the time when the costs are incurred. The term "delivery to the customer" includes instances in which the sale has taken place and the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

goods have been segregated or set aside for delivery.

154. **Classification of interest on intragovernmental balances**. Large amounts of interest are paid and received on intragovernmental balances. Most trust funds and some special funds and revolving funds have invested in special Treasury securities on which they earn interest due from the Treasury. Treasury and the Federal Financing Bank have made loans to a number of funds, on which those funds incur interest expense and on which interest is due to the Treasury or the Bank. The recorded interest revenue should be classified as exchange or nonexchange depending on the predominant source of funds upon which the interest payment is based. Other intragovernmental balances bear no interest. The Board is considering a project that might result in imputing interest where the balances bear no interest or the interest does not reflect the cost of borrowing by the Treasury.

155. The interest on these intragovernmental liabilities has the form of an exchange transaction, but often it does not also have the substance of an exchange. The standards in this Statement and the guidance in Appendix B, “Guidance on the Classification of Transactions,” differentiate among inflows of resources according to whether or not they should be deducted from an entity’s gross cost in determining its net cost of operations. This differentiation depends fundamentally on whether the inflow of resources is related to costs that the entity incurs and recognizes in order to produce outputs and the inflow of resources.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

156. When applied to the receipt of interest by a Government account from the Treasury, this criterion implies that interest should be classified in the same way as the predominant source of revenue to the fund: as exchange revenue, if the predominant source is exchange revenue; and as nonexchange revenue, if the predominant source is nonexchange revenue. If the invested funds come from exchange revenue, the interest on these funds derives from exchange revenue and the costs incurred to earn that revenue; if the invested funds come from nonexchange revenue, the interest on these funds is based ultimately on the government's power to compel payment rather than on a market transaction. With certain exceptions, this means that interest received by trust funds and special funds should be classified as nonexchange revenue, whereas interest received by revolving funds and trust revolving funds should be classified as exchange revenue. This is explained below, together with the exceptions and certain analogous transactions.

157. Invested balances of trust funds (and special funds) predominantly derive from earmarked taxes, which are nonexchange transactions with the public (e.g., employment taxes and gasoline taxes). To a lesser extent they derive from other financing sources (e.g., the General Fund payment appropriated to the Supplementary Medical Insurance fund). The balances are not earned in exchange transactions by the entity's operations. Most fundamentally, they are not produced by operations in which the entity incurs any costs. Therefore, the interest on Treasury securities should not be deducted from the gross costs of the trust fund (or special fund) in determining its net cost of operations. As a result, that interest should not be classified as an exchange revenue. It should instead have the same classification as the predominant source of the invested balances, which for most trust funds (and special funds) is nonexchange revenue.

158. The invested balances of revolving funds, on the other hand, predominantly derive from the funds' business-type operations. Revolving funds need capital in their operations and may invest some of that capital in Treasury securities. Since the holding of invested balances and the sale of goods and services are both integral to the funds' operations, the interest on their securities is related to the funds' costs of operations just as is the revenue earned from selling goods and services. Furthermore, the source of the invested balances is predominantly revenue previously earned from the sales of goods and services, for which the funds incurred

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

costs of operations when that revenue was earned. The interest they receive should therefore be classified in the same way as their revenue earned from selling goods and services and should likewise be deducted from gross cost in determining the net cost of operations. For this reason, interest earned by revolving funds should be classified as exchange revenue.

159. A few revolving funds are classified by law as trust funds. Trust revolving funds need capital in their operations, just like other revolving funds, the source of which is predominantly the revenue they have earned. When some of their capital is invested in Treasury securities, the interest is related to their cost of operations in the same way as the revenue earned from selling services; and the source is predominantly revenue previously earned from the sales of services, for which they incurred costs of operations. Their interest should therefore be classified in the same way as for other revolving funds, which is exchange revenue.

160. The three previous paragraphs explain the rationale for the normal classification of interest received by trust funds, special funds, revolving funds, and trust revolving funds. However, in some cases, the source of balances for trust funds and special funds may not be predominantly nonexchange revenue, and the source of balances for revolving funds and trust revolving funds may not be predominantly exchange revenue. For example, the main source of balances for two major trust funds, the Civil Service Retirement and Disability Fund and the Military Retirement Fund, consists of exchange revenue and other financing sources. In such exceptional cases, interest should be classified in the same way as the predominant source of balances rather than according to the normal rule.

161. Agencies may receive authority to borrow from Treasury (or the Federal Financing Bank), and they pay interest on their borrowings. The interest is a cost to the agency and an inflow of resources to the Treasury. The Treasury may be deemed to have borrowed from the public to finance the outlays for which the agency borrowed, and thus to have incurred a corresponding interest cost of its own. The interest received by Treasury from the agency is therefore related to Treasury's cost of borrowing from the public and should be classified as an exchange revenue.

162. When debt securities are retired before maturity, there may be a

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

difference between the reacquisition price and the net carrying value of the extinguished debt. This difference is a gain or loss that should be classified in the same category as the interest on the extinguished debt.

Measurement

163. Exchange transactions with the public ordinarily take place at prices set by the agency or the Congress, such as electricity rates, book prices, and interest on delinquent taxes. Sometimes the market sets the price, as with the rents and royalties from companies that bid to explore and produce oil and gas on the Outer Continental Shelf. In either case the actual prices represent the inflow of resources to the entity and, therefore, are the appropriate basis for measuring revenue.

164. Except for prices set by law, OMB Circular No. A-25 and other regulations generally provide that user charges for transactions with the public should be set at full cost or market price.[16] However, compliance with these regulations is partial, and potential revenue is not realized in many cases. To help report users understand how the entity's operations are financed, disclosures are needed about (1) differences in pricing policy from the guidance in OMB's circular on user charges and (2) transactions where prices are set by law or executive order and are not based on full cost or market pricing. Other accompanying information is needed about the revenue forgone in these transactions but only if a reasonable estimate is practicable. The other accompanying information should explain whether, and to what extent, the quantity demanded was assumed to change as a result of the change in price.

165. Circular A-25 defines "full cost" as "all direct and indirect costs to any part of the Federal Government of providing a good, resource, or service."[49] This generic definition and the accompanying examples in the circular are generally consistent with the definition of "full cost" in the managerial cost accounting standards[50]

---

[49] Circular A-25, section 6(d)(1).

[50] SFFAS No. 4, *Managerial Cost Accounting Concepts and Standards for the*

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

and the recognition and measurement of many particular expenses in other Federal accounting standards.[51] However, unlike those standards, Circular A-25 also includes as part of the definition of full cost an annual rate of return on land, structures, equipment, and other capital resources (unless they are rented);[52] and it includes depreciation not only on structures and equipment that are classified as general PP&E (property, plant, and equipment), which is required by Federal accounting standards, but also on structures and equipment classified as stewardship PP&E, which in a few cases may be used in connection with the production of goods or services for sale.[53] Aside from these differences, the cost accounting and other accounting standards should enable the Circular A-25 definition of full cost to be measured more accurately than has been possible heretofore.[54]

Federal Government, pp. 38-44.

[51]For example, the standards for expenses related to credit are stated in SFFAS No. 2, *Accounting for Direct Loans and Loan Guarantees*; and numerous standards for expense are stated in SFFAS No. 5, *Accounting for Liabilities of the Federal Government*.

[52]The Board currently has a project to consider whether the rate of return on capital should be recognized as a cost in financial accounting statements.

[53]The extent of differences between Circular A-25 and Federal accounting standards can be found by comparing Circular A-25, section 6(d)(1)(b), with SFFAS No. 6, *Accounting for Property, Plant, and Equipment*.

[54]Circular A-25 says that "full cost shall be determined or estimated from the best available records of the agency, and new cost accounting systems need not be established solely for this purpose." See section 6(d)(1)(e). The cost accounting and other standards should improve agency records and specify the nature of costs more precisely and comprehensively.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

166. The appropriate basis for measuring revenue from intragovernmental exchange transactions is likewise the actual price (or reimbursement) that the seller receives from the buyer. Accounting systems should be able to provide the information needed to set the reimbursement at full cost, but often the full cost is not charged. In these cases, the amount of the reimbursement is an incomplete measure of the economic value of the transaction. When one entity receives goods or services from another without paying all related costs, the net operating cost of the receiving entity is understated if it does not recognize (by imputation) the additional cost paid by the providing entity.

167. Other Federal financial accounting standards require such inter-entity cost subsidies to be recognized by the receiving entity in certain cases.[55] This Statement, in the section on "Other Financing Sources," provides standards to recognize other financing sources that are imputed to offset whatever subsidy costs those other standards require to be recognized and imputed. Accounting for the imputed cost of goods and services provided by one Government entity to another requires the exercise of judgment, based on the specific circumstances of each case. Therefore, whether costs are imputed or not, the providing entity should disclose an explanation of the amount and reason for material disparities between the billing (if any) and the full cost.

[55] The general principles for recognizing imputed cost are stated in SFFAS No. 4, Managerial Cost Accounting Concepts and Standards for the Federal Government, pp. 43-50. The accounting is similar to the accounting for employee pensions and retirement health benefits, where the entity administering the plan does not provide goods or services to the reporting entity but does pay some or all of the cost. See SFFAS No. 5, Accounting for Liabilities of the Federal Government, pp. 20-36 and 56-63.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

NONEXCHANGE REVENUE

Inherent Limitations

168. **Inherent limitations on the ability to perform accrual accounting for nonexchange revenue.** Accrual accounting recognizes the financial effects of transactions and events when they occur, whether or not cash changes hands at that time. As it does with respect to exchange revenue, full accrual accounting for nonexchange revenue would enhance financial planning, control, and accountability. Full accrual accounting could provide important data with respect to future cash flows and tax policy and could improve the ability to evaluate the performance of the collecting entities and the exercise of their custodial responsibilities.

169. Unfortunately, the degree of accrual accounting that is practicable to perform for taxes and duties is limited by difficulties in ascertaining the amount of revenue arising from the underlying events and by the assessment processes used to manage the collecting functions. Taxpayers may not ascertain taxable income until after the underlying events. They may not file returns on their due dates, and due dates are generally set by the administrative processes after the occurrence of the underlying event. Also, the extent of non-compliance is a function of the laws establishing these entities and the expectations by the Congress and the Administration about how diligently the collecting entities should perform their collection functions. These inherent limitations on the ability to perform accrual accounting were considered by the Board.

Practical Limitations

170. **Practical limitations were also considered by the Board.** The Board's standards for accrual accounting require that accruals mirror the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

established assessment processes of the collecting entities. As such, they do not require, for example, the accrual of taxes or duties which are likely to be assessed under established processes, but only those that are actually assessed under the defined processes of the collecting entities. Having accounting mirror the established process by which collecting entities interact with taxpayers has value, though arguably accounting for revenue should not be so limited.

171. At the time the Board began deliberations on this standard, accounting systems necessary to determine even the limited revenue accruals that are now required for taxes did not exist. The changes in systems required by this standard are limited to those necessary to mirror the established assessment processes. The Board understands that the Internal Revenue Service is attempting to improve its collection function and the related management information systems. Because such systems must also provide accounting information, the Board decided not to impose accounting standards at this time that might conflict with systems changes needed to improve the efficiency and effectiveness of the collection process or go beyond the minimum changes considered necessary to enable the collecting entities to properly discharge their responsibilities.

Modified Cash Basis for Taxes and Duties

172. As a result of both the inherent limitations and the practical limitations accepted by the Board, the accrual standard, as it applies to taxes and duties, might be best characterized as a "modified cash" basis of accounting. These limitations on full accrual accounting required the amendment of the accounting standard on recognition of receivables as provided in paragraph 41 of SFFAS No. 1, which said, in effect, that taxes should be recognized as receivables when they are due from taxpayers.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

173. In the future, the general standard for accrual as it applies to taxes and duties could be tightened to produce a fuller application of the accrual concept. For fines, penalties and donations, no accountable event precedes the recognition point established by this standard. Therefore, the general standard for recognition as it applies to these sources of revenue results in full accrual accounting for them.

Cash Basis Information Needed

174. Cash basis information on taxes and duties continues to be very important because it is widely used for planning purposes at present and is a component of the budget. It is also available soon after the close of the reporting period and is needed to comply with laws that require cash-basis accounting in particular instances. Unfortunately, accurate cash-basis information to meet certain legal requirements and other information needs is not presently available. This standard accepts the importance of both types of information and requires entities that collect taxes and duties to provide both types of information.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Potential Changes

175. Requirements for disclosures, supplementary information, and other accompanying information compensate to some extent for the modified cash basis of accounting for taxes and duties being approved at this time. In the future, the Board plans to evaluate users' satisfaction with reports prepared on the basis of the standard and to give consideration to improvements being made in IRS processes and related management information systems. Based on this evaluation and consideration, it may propose to extend the degree of application of accrual accounting in several years time. In the interim, the Board will permit changes in accounting made at the initiative of a collecting entity if the changes represent a fuller application of accrual accounting than that prescribed by the standard. For example, compliance assessments for taxes or unasserted claims for drawbacks may be recognized rather than shown as supplementary information if the amounts are both probable and reasonably estimable.

Entities Responsible for Measuring and Recognizing Revenue

176. Collecting entities, e.g., the Internal Revenue Service and the Customs Service, collect cash and administer the assessment processes that provide the basis for adjusting those collections to an accrual basis. They, therefore, have measurement and reporting responsibilities for these inflows of resources. They also, at the direction of the Treasury Department, account for the disposition of these inflows to recipient entities. The Treasury determines the amounts payable to the recipient entities and, in conjunction with the collecting entities, makes the actual cash payments, or issues special Treasury securities, as necessary, to fund the amounts transferred. Because the recipient entities are designated by law to receive the inflows and make ultimate disposition of the funds, they, rather than the collecting entities,

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

must recognize the inflows as revenues in order to provide financial statements which are meaningful to users.

Possible Over- and Under-funding of Trust Funds

177. The standard provides that trust funds should recognize the amounts transferred (and the change during the period of the amounts to be transferred) from the collecting entity as revenue despite the fact that those transfers may not be made on the basis of applicable law. In the case of excise taxes, transferring more than the amounts actually collected may cause these trust funds to be over-funded. The Board is advised by its legal counsel that this is a violation of law by the IRS. Such violations cannot be remedied unless, and until, the IRS adopts methods to collect the needed data from taxpayers. In the case of Social Security, weaknesses in the data collection methods may cause these trust funds to be under-funded. The Board is advised by its legal counsel that so long as IRS and SSA act on the basis of the best available information there is no violation of law. In considering these two situations, the Board concluded that it should not set an accounting standard with which the recipient entities could not comply and, therefore, accepted the present basis of making transfers to them as the basis of recognition of revenue by them. However, the Board believes that both the collecting entity and the recipient entity have the responsibility to disclose any violation of law and to provide, as supplementary information, if estimable, amounts by which the trust funds may be over- or under-funded.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Conceptual Criteria for Accrual and Limitations on Their Application

178. As mentioned earlier, this standard recognizes both inherent and certain practical limitations on the application of the accrual concept to taxes and duties. The conceptual criteria for full accrual accounting for taxes and duties are the underlying taxable events, a precondition for the government to assert a demand for payment, and a demand date itself. A demand date conceivably could be as early as a date contemporaneous with the underlying events.

179. **The underlying taxable events.** Conceptually, certain Government taxes and duties could be accrued based on particular events, and certain others on events that take place over a period. Excise taxes and customs duties are examples of taxes based on particular events (sales or importing goods). Individual and corporation income taxes are examples of taxes based on events that take place over a period (e.g., income earned over the course of a year). Indeed, some taxpayers who prepare accrual-basis financial statements for themselves normally accrue taxes due to the government based on the underlying events.

180. Data about underlying events is supplied to collecting entities through returns required to be filed by taxpayers. Unfortunately, non-compliance with return requirements is estimated to account for more than $100 billion annually in uncollected taxes. Only a relatively small portion of this amount is ultimately collected through the enforcement processes of the collecting entities. Estimates of this tax gap made from time-to-time have provided some information to guide enforcement efforts with respect to particular groups of tax payers, but do not provide sufficient information to establish claims against individual non-compliant taxpayers or defined groups of non-compliant taxpayers. Therefore, the underlying-event criterion for recognition can only be applied to the extent that taxpayers file

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

tax returns[17] or the collecting entities determine through their enforcement processes that specific non-compliant taxpayers owe or might owe taxes.

181. **The demand date.** To obtain taxes and duties, the government must demand the payment. The criterion for revenue recognition under this concept could be that the demand date for taxes and duties is the same as the date the underlying taxable event occurs or over the period that the underlying taxable event occurs, e.g., as taxable income is earned by the taxpayer. However, demand dates presently defined by established assessment processes are the dates payments are required to be received by the collecting entities. They include dates for withholding and estimated tax payment as well as the final due dates for tax returns. These dates provide administrative convenience for taxpayers and generally lag the underlying events. Because of the emphasis on cash, those payments made in advance of due dates for payment are not deferred for accounting purposes. Past-due taxes as a result of taxpayer failure to comply with established payment dates are not accrued until the collecting entities receive late tax returns from such taxpayers, or until the collecting entities determine through their enforcement processes that the Government has a legally enforceable claim. Only then are accounting accruals triggered under this standard. Those dates lag the underlying events by more than necessary to determine an accrual. The aforementioned limitations on the application of the demand criterion, which are arguably practical ones, further constrain the conceptual basis for accrual.

Limitations on the Scope of Accounting

182. Although relevant to the cost of the Government from an economic perspective, to Government fiscal policies, and to performance evaluation of Government reporting entities, the Board concluded not to require information on "tax expenditures" or expenditures that federal laws require others to make, i.e., "directed flows of resources." There were a variety of opinions among Board members on the need for this information and different reasons given for not requiring some form of disclosure, but all Board members agreed that relevant amounts are not normally measured under present accounting concepts. However,

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

information may be provided under certain circumstances, but outside the financial statements themselves.

Some Benefits of this Standard

183. **Some of the benefits of the accrual requirements of this standard:**

- Reporting the "accrual adjustment" as a separately identified adjustment of taxes and duties collected. This preserves needed cash-basis information.

- Improving the data for both accrual- and cash-basis information. The standard accomplishes this because all transactions for which accounting could be performed under the standard will need to be processed. Some of these have not been accounted for in past financial reports because of delays in processing transactions at the end of the year.

- Accrual of assessments. Accounts receivable would be accrued based on returns filed or enforcement actions taken through the end of the period where such returns or actions have not yet resulted in cash receipts. A statistical estimate of the effect of this standard, as of September 30, 1993, disclosed approximately $29 billion of net accounts receivable after deducting an allowance for uncollectible amounts of $42 billion. Heretofore, net accounts receivable were thought to be in excess of $100 billion. The accounting requirements for accrual should further improve the accuracy of the amount of accounts receivable.

- Recognition of refunds payable will provide some indication of the lag in making refunds to taxpayers.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Some Things this Standard Does Not Accomplish

184. **Some of the things this standard does not accomplish:**

- Recognizing events after the close of the reporting period, such as cash received on later due dates, even if the receipt results from the underlying taxable events of the period. For example, unemployment taxes for the September 30 quarter are due in October and will be recognized in October if received on the October due date.

- Deferring recognition of revenue for tax payments that may be received before the demand or underlying event. For example, voluntary over-withholding by taxpayers will be treated as revenue.

- Recognizing compliance assessments and pre-assessment work in process or refunds before completion of the assessment processes. As a result, variations in the speed and effectiveness of the assessment processes will affect the amount accrued at the end of a fiscal period. Another result is that accounting information relative to measurement of the performance of the compliance functions by the collecting entities will not be available.

- Recognizing the tax gap, i.e., taxes (which include duties) due from unidentified non-compliant taxpayers and importers. As a result, this large potential source of revenue will not receive as much attention as it would if it could be made a formal part of the collecting entity's accountability.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

- Accounting for "tax expenditures," which may contribute to the programs of reporting entities, or "directed flows of resources," which may substitute for program costs which might otherwise need to be incurred by reporting entities. These amounts are very large in relation to the "on budget" program amounts which are measured by accounting. As a result, these materially important performance and cost related data may not be fully considered.

Accounting Systems Changes

185. The IRS accounting system at present does not account for revenue transactions on an accrual basis and, therefore, does not establish accounts receivable, refunds payable, and the allowance for uncollectible accounts on the basis of the flow of all the various events and transactions affecting these balances. Instead of being an accrual accounting system, all assessments are recorded in an operating file not designed to do accounting and not operated under a double entry concept where the revenue effects of assessments are determined. That operating file, for example, includes multiple assessments made for the same tax claim so that the IRS can pursue all potential sources for the payment of that claim. As a result of the present limitations of this operating file, to determine the accounts receivable at any point in time, the IRS must make a statistical projection of a representative sample of valid tax claims. The potential error in the estimates made to date have been material, i.e., in excess of $5 billion.

186. This standard contemplates that systems and accounting records will be put in place to permit the accurate determination and disclosure of all revenue and cash transactions which are reflected in the formal assessment process. By treating information relating to compliance assessments, pre-assessment work in process, and refunds before the completion of the assessment process as

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

supplementary information, this standard contemplates that statistical estimates, rather than transaction-driven accounting systems and auditable subsidiary accounting records for individual taxpayers, may be used to provide the dollar values for these important revenue-related items.

Disclosures, Supplementary Information, and Other Accompanying Information

187. This additional information will help users of federal financial reports in understanding the following:

187.1. **Components of the revenue stream.** By disclosing the dollar amounts of the material types of transactions reflected in the required "modified cash basis" revenue stream (from initial recognition by the established assessment process through cash collections and refunds), important accountability information for oversight and performance evaluation will be provided about the tax collection function. Providing as much accurate and detailed information as possible about the annual flow of taxpayer funds (now over $1 trillion) is important because the administration of the collection function is to some degree discretionary.[18]

187.2. **Cash flows.** By disclosing cash flows by type of tax and tax year, accurate historical information will be provided about the source and timing of the annual flow. Material trends in collection and refund patterns may be apparent from the comparative financial statements presented and by reference to financial statements of prior periods. Both the ability to accurately forecast future flows and to understand the speed and effectiveness of the collection function should be enhanced by this information. Also, an indication of the degree of potentially correctable "error" from the use of a modified cash basis of accounting should be provided by this cumulative cash flow data.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

187.3. **Other future-oriented information**. Disclosures about categories of accounts receivable provide additional information about collection problems and timing of future cash flows. At IRS, different categories of receivables vary considerably in terms of ultimate collectability and timing of collection.

187.4. **Other potentially reportable revenue.** Supplementary information on compliance assessments and pre-assessment work in process and on refunds before the completion of the assessment processes provides indications of the amounts of potentially accruable revenue. If such amounts were ultimately accrued, the "accrual adjustment" on a modified cash basis would be converted to an "accrual adjustment" that came closer to an estimate of the effect of full accrual accounting. Some or all of these potential accounts receivable and payable may become measurable by the collecting entities, and the Board may require their accrual when the collecting entities' management systems are improved.

187.5. **Sharing of the income tax burden.** Other accompanying information about the tax gap and IRS historical information showing income, deductions, and credits by income level (assets for corporations) responds to those concerned with the extent of non-compliance with the laws and how the income tax burden is shared among compliant taxpayers.

187.6. **Administration of the tax laws by the collecting agencies.** Disclosures, supplementary information, and other accompanying information provide a more complete picture of how the collecting agencies are functioning. This information may be relevant to allocation of resources to collecting agencies, to their performance appraisal, and to their oversight.

- Supplementary information on compliance assessments and pre-assessment work in process and on refunds before the completion of the assessment process shows the backlog in processing assessments and refunds.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

- The disclosure and supplementary information with respect to over- and under-funding of the trust funds identifies administrative problems to be overcome.

- Disclosure of abatement of assessed taxes with respect to non-compliant taxpayers ($37 billion by the IRS in 1993) provides some information about the administrative discretion exercised by collecting entities. However, no information is required about reductions of possibly material amounts in compliance assessments and pre-assessment work in process as a result of the resolution of examinations, investigations, protests, and litigation. Therefore, accounting reports will not include data about these processes, which involve an even higher degree of administrative discretion than the formal assessment process. Nor will they provide data, e.g., compliance assessments made during the reporting period, that might be related to the cost of compliance, e.g., salaries of revenue agents and related administrative costs, that might be relevant to evaluating the performance of the collecting entities' compliance function.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Tax Gap

188. The exposure draft proposed that available information about the nonexchange revenue gap, including the tax gap, be provided as "other accompanying information." This information would not have been subject to audit, and the auditor's responsibility would have been limited to reporting if it was materially misleading in light of the information gathered during the audit. Substantially all of the revenue gap is the tax gap because duties are technically a type of tax, so the Board decided to deal only with the tax gap. The sources of non-compliance that cause the tax gap include unreported income, overstated exemptions, and overstated deductions. The largest component of the tax gap relates to income taxes. IRS originally estimated the gross income tax gap at $94 billion for tax year 1987. The net income tax gap for 1987, which is the gross income tax gap less the estimated amount that has been or will be collected through IRS's enforcement efforts, is now estimated at $72 billion. Thus, with respect to 1987, later collections from non-compliant taxpayers are about $22 billion. Estimates of the income tax gap cover only taxes on legally earned income of individuals and corporations--not taxes owed from illegal sources of income such as drugs and prostitution.[19]

189. Estimates of the tax gap by IRS have been made from time to time. Congress recently concluded not to authorize a current study[56] and there is no present plan to conduct another one. On the other hand, Customs makes estimates of amounts due from unknown non-compliant importers. The Board concluded, therefore, that the standard should require only that any estimates by the Government of the tax gap be presented when they were relevant, i.e., provided reasonably current information is available.

[56] The Tax Compliance Measurement Program (TCMP) planned for 1996.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

190. Some respondents to the exposure draft believed that tax gap information is important, but others believed it is too imprecise to be a required disclosure. The Board considered establishing a new category of information "Required Supplementary Stewardship Information" (RSSI) for the "unidentified persons or entities" portion of the tax gap. This concept is also being considered for application to certain "Stewardship Information." The Board concluded that for the time being this standard should say that available information about the tax gap should be provided as other accompanying information. In addition to the tax gap information requirements (see para. 0), other accompanying information is required or permitted under certain circumstances with respect to (a) the income tax burden (see para. 0), (b) tax expenditures (see para. 0), (c) directed flows of resources (see para. 0), and (d) revenue forgone for exchange transactions (see para. 0).

191. The Board intends to review the requirements in this standard to provide other accompanying information when it considers standards for the Management Discussion and Analysis (MD&A). The Board may decide to modify the information requirements when it considers the degree to which this information should be subject to some sort of audit scrutiny. Auditing standards for the MD&A have not been established by any auditing standard setters, including the Comptroller General, who establishes standards for auditors who audit federal organizations, programs, and activities. It is expected that audit standards for an MD&A will be considered by the Comptroller General's Advisory Council and standards may be set later by the Comptroller General. Particular audit requirements for MD&A may be set by agreement between OMB and GAO if consistent with any such standards then existing. When the Board's project on MD&A is considered, OMB and GAO plan to give consideration to the auditing requirements for MD&A and to the concept of RSSI.

Tax Expenditures

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

192. Tax expenditures are estimates of the revenue forgone because of preferential provisions of the tax structure. They are due to special exclusions, exemptions, deductions, credits, deferrals, and tax rates that depart from a "baseline." These exceptions are generally intended to achieve public policy objectives by providing benefits to qualifying individuals or entities or by encouraging particular activities. They also may be intended to improve tax equity or offset imperfections in other parts of the tax structure. Tax expenditures are not revenue. They are not inflows of resources to the reporting entity.

193. The following are some examples of tax expenditures (with estimates from the Treasury Department of the revenue forgone in FY 1995):

- the exclusion from gross income of the housing and meals provided military personnel ($2.0 billion);
- tax credits for expenditures to preserve and restore historic structures ($0.1 billion) and to produce "alternative" fuels ($1.0 billion);
- exclusion from gross income of employee compensation in the form of health insurance premiums and other medical care ($59.4 billion); and
- deductions for mortgage interest ($48.1 billion) and state and local property taxes ($15.3 billion) on owner-occupied homes.

194. The Board considered a proposal to require each reporting entity to provide supplementary information on tax expenditures related to its missions. The amounts reported would have been the Treasury Department's estimates that are published in the President's budget.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

195. Those who supported that proposal believe that this information is relevant to evaluating the performance of Government programs that have related tax expenditures. Some of these tax expenditures are very closely tied to program operations. Others are less closely tied to an agency's operating activities but still relate to its mission. For example, the preferential treatment of owner-occupied homes can be related to HUD's mission to promote good housing for the nation.

196. Furthermore, policy makers may compare changes in tax expenditures with changes in direct budgetary outlays. They did so, for example, in 1983 and 1993 when they increased the taxation of Social Security benefits but alternatively could have reduced the cost-of-living adjustment. In ways such as these, the reporting on the costs and accomplishments of an entity is incomplete unless it includes the tax expenditures related to its missions.

197. The Board decided not to require supplementary information on tax expenditures in component entity financial statements for several reasons. The definition of the baseline for comparison is in part a matter of values and judgment. In some cases the association with particular programs is not sufficiently clear. Furthermore, the information is available elsewhere now. However, the Board agreed to permit reporting entities to present, as other accompanying information, information on tax expenditures that the reporting entity considers relevant to its programs, if suitable explanations and qualifications are provided.

Directed Flows of Resources

198. The Board considered a proposal to require each entity to provide supplementary estimates of the material annual expense to nonfederal entities of existing federal laws and regulations associated with its programs. The requirement

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

would have been limited to regulations that establish standards for the characteristics of products or for the methods of production, or that mandate expenditures by state and local governments. These estimates would not necessarily have included nonpecuniary costs, although nonpecuniary costs might have been included to the extent identifiable. Each entity also would have provided any appropriate explanations about availability of data and limitations on the reliability of the estimates.

199. Advocates of the proposal believe that the Government pursues some of its goals by requiring states, local governments, and private entities to spend funds for specified public purposes. For example, the Government may require states to extend the coverage of Medicaid, communities to have water treatment plants that meet Government safety standards, firms to minimize their workers' exposure to asbestos, and automobile manufacturers to install air bags. When the regulations apply to state and local governments, they are generally called "unfunded mandates."

200. The costs and financing of federal regulations do not flow through the Government, but their effects are similar to the effects of direct federal expenditures and revenue. Fundamentally, both regulation and federal expenditure allocate resources to the purposes specified by the Government. The cost of regulation includes regulations imposed in the past as well as newly issued regulations. Furthermore, expenditure required by regulation may be an alternative means of achieving the same public policy goals as direct federal expenditure or other methods. For example, Medicaid coverage may be extended with or without more federal grants.

201. Advocates of this requirement believe that financial reports that omit important financial effects of Governmental action do not fairly present the results of the Government's

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

operations. Such reports fail to achieve the objectives of federal financial reporting. They believe that the efforts and accomplishments with which an agency pursues its goals can be properly assessed only if the financial reports include all material information. This means that the reports should bring together information about the net cost of operations, the tax expenditures, and the directed flows of resources that are intended to achieve the same or similar missions.

202. The Board decided not to require supplementary information on directed flows for several reasons. Much of this information is not available now and will not be available to preparers of financial reports without added expense. In some cases the estimates would be very imprecise. Finally, most Board members believe that the scope of Government financial reporting should not extend to flows of financial resources that are not inflows to, or outflows from, federal Government reporting entities. However, the Board agreed to permit reporting entities to present, as other accompanying information, information on directed flows of resources that the reporting entity considers relevant to its programs, if suitable explanations and qualifications are provided.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

OTHER FINANCING SOURCES AND BUDGETARY RESOURCES

General Principles

203. The standards for other financing sources and budgetary resources should satisfy several of the objectives of financial reporting such as: (1) explaining the relationship of budgetary resources obligated to the net cost of operations, (2) showing how budgetary resources were used and the status of budgetary resources at the end of the period, and (3) indicating the effect on the net results of operations of the entity of all the financing sources used to finance the net cost of operations. However, financing from a financial accounting (proprietary) perspective is different than the budgetary accounting perspective.

204. The budget is the primary financial planning and control tool of the Government. Its objectives, such as planning resource allocation, authorizing and controlling obligations, planning cash disbursements, and raising revenue, differ from those of financial reporting where the focus is on net cost of the entity's programs and activities and stewardship of its assets and liabilities. Differing objectives are responsible for some but not all of the many differences in these two financial management tools. Differences in standards for measuring and reporting budgetary and financial information, coupled with unreliable data, have caused financial statements to be under-utilized by Government managers, the budget community, and others who might benefit from financial information.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Reducing Differences

205. The problem of unreliable data is being addressed through financial statement audits that will include both proprietary and budgetary information and improvements in financial management systems. These federal accounting standards reduce unnecessary differences between the information reported in these two tools of financial management and require reconciliations and data to explain necessary differences. This should increase the utility of the financial planning and control information provided by the flow statements in general purpose financial reports and enhance the usefulness of the other accountability information provided, e.g., the Balance Sheet. This should occur because those who focus on the budget will better understand the financial statements and find them to be reliable and useful reports.

206. The new recognition and measurement standards for financial accounting adopt budgetary flow concepts for appropriations and provide consistent flow standards for nonbudgetary resources. As explained earlier, standards for recognition of nonexchange revenue reported by Government entities reflect legal requirements. These changes make the reporting on financing for entity net costs more consistent among entities and more comparable to the budget.

207. However, differences inherent in the different objectives of the budget and the financial statements must remain. The obligation basis for the budget differs from the costs-incurred basis for the financial statements. This difference must continue in order for both types of information to serve their purposes. Some budgetary resources are used to invest in assets and therefore are not reflected in operating costs. Also, an entity may incur costs that were covered by previously provided budgetary resources (e.g., depreciation), costs not yet covered by budgetary resources (e.g., accrued

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

annual leave), or costs covered by budgetary resources of other entities (e.g., some pension costs). Continuing these differences in the accounting reports is essential if financial statements are to report cost information that can be related to entities' outputs and if the statements are to report other information on the resources over which the entities are accountable. These remaining differences need to be explained in the financial statements to increase the utility of the financial statements.

The Budgetary Process and Its Linkage to Accounting

208. The budget controls obligations and thus ultimately controls expenditures by Government entities. In this sense, it is about their outflows of resources. Conversely, the budget makes inflows of resources available to component entities to finance expenditures. The inflows are reported in the financial statements as revenues and other financing sources (e.g., appropriations).

209. The budgetary process provides a component entity with budgetary resources through appropriations acts. Budget authority may be provided in the form of appropriations, borrowing authority, contract authority, or spending authority from offsetting collections. An appropriation may make funds available from the General Fund, special funds, or trust funds--including amounts received from earmarked taxes--or may authorize the spending of offsetting collections credited to expenditure accounts. Budgetary resources also include unobligated balances remaining from prior reporting periods and a number of adjustments (e.g., recoveries of prior year obligations). Execution of the budget includes the obligation of budgetary resources and the outlays to liquidate the obligations.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

210. Borrowing authority is sometimes used instead of appropriations to incur obligations and make payments to liquidate them out of borrowed money. However, borrowing money under this authority does not change the net position of the entity. The liability created by the borrowing is recorded along with the related asset (the cash borrowed). Repayment of the liability later will normally require the use of an offsetting collection or an appropriation. Assets acquired as a result of borrowing may be later amortized or written off and become part of an entity's costs. When this occurs, or in the unusual event that the borrowing finances expenses rather than assets, the entity's net position will be reduced.

211. Contract authority is not a reportable financing source because it only allows agencies to incur obligations in advance of receiving funds to pay for any resulting liabilities. The funds to liquidate any resulting liabilities will come from an appropriation or offsetting collections. For financial statement purposes, a financing source is recognized in accordance with the appropriate accounting standards for the type of financing received to liquidate the liability. Under past practice the financing was recognized at the time liabilities were incurred, but under the new standard the financing will not be recognized until liquidating appropriations are made available, which may be in the same reporting period as the liability is incurred or a later period.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

212. Appropriations, including permanent indefinite appropriations, are the most widely used form of budget authority. When obligated by orders for, or receipt or provision of, goods, services, or benefits, they are reflected as obligations incurred.[20] When used, appropriations are accounted for as an inflow of resources (i.e., an other financing source) in calculating net results of operations for the reporting period.

213. From the budgetary perspective, appropriations include dedicated tax receipts, such as Social Security taxes and Highway Trust Fund excise taxes. From a proprietary perspective, on the other hand, unexpended appropriations do not include dedicated tax receipts, because these receipts are accounted for as nonexchange revenue. Therefore, appropriations used do not include dedicated tax receipts, thus avoiding double counting of these amounts as financing sources.

214. The accounting treatment for recognizing "appropriations used" as a financing source parallels the budgetary accounting for expended appropriations. Expended appropriations are recognized when goods and services ordered have been delivered, when benefits are payable to recipients, or when funds available under a grant agreement are payable, and there is an available appropriation to pay these amounts. Under this standard, this is also the time when "appropriations used" is recognized as a financing source in the proprietary accounts.

215. Thus, at the time a liability is established which will be paid by an available appropriation, appropriations are considered used. Liabilities should be established in accordance with SFFAS No. 5. Under that standard, a liability can be established in several ways, and the type of transaction that has occurred governs when a liability has occurred. For example, grants can be provided under different transactions. Some can be provided without any required exchange of service with the federal government, while others may require specific activities to occur before the funds are available.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

216. Providing funds from an appropriation does not necessarily cause the recognition of a financing source if that payment is an advance. For example, an entity may advance funds to a grantee under the grant agreement. This should not cause recognition of a financing source. The recognition of appropriations used would not occur until the grantee meets the requirements that allow it to use the funds in accordance with the grant agreement.

217. The focus on net cost rather than on matching financing with expenses as incurred provided an opportunity to simplify the accounting for appropriations and to eliminate one of the differences between financial and budgetary accounting. Reporting entities will no longer have to defer recognition of appropriations used nor accrue appropriations before they become available.

- Recognition was previously deferred for appropriations used to finance capitalized transactions, such as the purchase of a fixed asset or the making of a loan under pre-credit reform programs which have not converted their accounts to a present value basis. The use of financing was previously recognized at the same time and rate that depreciation of the asset's cost was recognized as an expense or that bad debts expense was recognized on pre-credit reform receivables which had not been converted to present values.

- Accrual of appropriations as amounts receivable was sometimes allowed for costs incurred but not funded until after the period the costs were incurred, such as subsidy reestimates under the Credit Reform Act. Reestimates of subsidy cost for credit programs are made at or after the end of a period for which the reestimate applies and for which an expense is recognized, but the permanent indefinite authority is not available until the following period. When a financing accrual was not used for unfunded expenses, the unfunded expenses were removed from cumulative results of operations and reported separately in net position as future funding requirements.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

218. These changes eliminate reporting invested capital and future financing sources in equity. These two equity accounts did not provide accurate information because invested capital was never expected to be returned and future financing requirements did not cover all future financing needed but only that amount which had been recognized as expenses.

219. An appropriation may provide an agency with the authority to obligate and expend earmarked receipts to which it is legally entitled and its offsetting collections. Most of these inflows of resources are classified and accounted for as either exchange or nonexchange revenue in accord with the accounting standards previously discussed. However, the relationship is not exact between these revenues and related new budget authority. For example, some offsetting collections are neither a revenue nor a financing source. They only change the form of a resource already reported on the Balance Sheet (e.g., funds received from the sale of an asset at book value). Some offsetting collections are credited to receipt accounts instead of expenditure accounts and cannot be obligated without specific appropriation. Some of these revenues are precluded from obligation in a fiscal year by a provision of law, such as a benefit formula that determines obligations, or by a limit on the amount of obligations that can be incurred. Amounts precluded from obligation are not counted as budget authority in that year.

220. By recognizing nonbudgetary resources, e.g., imputed financing and transfers, the financial statements of the entity will show how its recorded costs were financed by the budgetary resources of other entities as well as its own.

(a) "Imputed financing" sources are reported to offset budgeted costs of another entity that applicable accounting standards impute to the reporting entity.[57] The imputing process recognizes these costs in the net cost of operations of the responsible entity. By reflecting "imputed financing" in the changes in net position, the net position of the responsible entity is not affected and there is no double

[57] Imputed financing sources may be reported to recognize imputed costs that have not yet been budgeted for other entities, such as for pensions and retirement health care.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

counting.

(b) "Transfers-in" and "Transfers-out" are necessary to show transfers of assets or revenue from one Government entity to another. In the case of assets, the transferor's budget reflected the original expenditure for the asset, but the budget normally does not reflect the subsequent transfer of the asset. The transfer changes the entity's financial position at the time of transfer but not its net cost of operations. Therefore, it is recognized in determining the net results of operations for the reporting period but not net cost.

221. In the case of earned revenue, the budget may require the earned revenue inflow related to the entity's costs to be paid to the General Fund or another entity. Reporting the transfer-out of such revenue as a reduction in net results of operations lets the responsible entity properly report its earnings in net cost of operations without increasing its net position.

222. Donations are not included as receipts in the budget, except for cash and near-cash items. However, some other kinds of donations are also recognized as revenue. Such revenues are permanent differences between the budget and the financial statements. Donation revenue will increase net results of operations under these standards. Under the standard, accounting for donations is consistent with current practice in the private sector where contributions are recognized as revenue.

223. Costs that are not yet covered by budgetary resources are "permanent" differences until Congress acts to finance them in the budget or until permanent budget authority becomes available. Under the new standards, financing yet to be provided for recorded costs will not be accrued. Accordingly, it will not increase cumulative results of operations.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Implications of the term "Net Results of Operations"

224. Some of those who commented on the exposure draft expressed concern that some readers might infer that the amount of "net results of operations" reported on the new Statement of Changes in Net Position was a relevant performance measure. Some financial statement users might draw such an inference because, in the private sector, the term "net results of operations" is synonymous with net income and net income is the "bottom line" performance measure. Similarly, the statement of operations used by federal reporting entities prior to implementation of SFFAS No. 7 focused on a similar bottom line, net results of operations. This was the result of showing the flow of all operating activities on a single statement. For most governmental entities, however, no single bottom line can accurately measure performance, and "net results of operations" normally provides little information on either the costs or the benefits of an entity's operations.

225. The new reporting model, illustrated in Entity and Display, focuses on measuring costs and reporting on performance. Both gross and net cost are key financial performance measures that can be related to outputs and outcomes of the entity's programs and activities.

DEDICATED COLLECTIONS

226. The exposure draft proposed disclosure requirements for trust funds that were included within the reporting entity's financial statements in total and for material individual fund. The information was proposed to provide users a basis for understanding these funds and for holding the Government accountable for the use and disposition of earmarked collections. Based on comments received, this standard changes what was proposed

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

as follows.

226.1. The proposed standard did not cover funds administered by a federal entity in a fiduciary relationship with beneficiaries that were not included in the entity's financial statement. In addition, it did not cover other funds which are of the same nature as many trust funds. The standard now requires disclosures for these funds also.

226.2. The requirement for a total for all funds was modified. If the fund is not material to the reporting entity, disclosure may be made in a special report to the contributors and beneficiaries (or their representatives) and only disclosure of the total of these funds is required.

227. **User needs.** Funds that account for dedicated collections are of great interest to users of federal financial statements. First and foremost are the contributors and beneficiaries to which the Government needs to be accountable for the receipt and disposition of earmarked collections and for the balances that remain available to pay beneficiaries in the future or serve other purposes determined by law. Other users are interested in the financing of other government operations with these fund balances.

228. External users of federal financial reports sometimes misunderstand the relationship of these funds, especially trust funds, to the Government. Very few Government trust funds are held "in trust" in a fiduciary relationship as is customarily the meaning of this term outside the Government. Also, some of the trust funds currently spend less than the receipts they collect each year. Most of the cash surplus that arises when receipts are greater than outlays is invested in Treasury securities until the amounts are needed for the trust fund to use in accordance with benefit formulas or other provisions of the law.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

229. The Treasury uses these additional receipts to meet the cash needs of general operations, thus reducing the need to borrow from the public, raise taxes, or reduce spending. In the consolidated financial statements of the Government, the investments in Treasury securities held by trust funds and other fund entities and the corresponding debt owed by the Treasury to these funds cancel out. They are eliminated from the amounts reported in the consolidated Balance Sheet but footnote disclosure of these amounts normally has been included.

230. **Funds covered by the standard.** As pointed out by respondents, trust funds are not the only type of fund that collects dedicated moneys. However, the exposure draft did not specifically delineate which funds might be included in the wider scope. The Board decided to limit these disclosures to funds where there was a need to show accountability to contributors and expected beneficiaries. Therefore, the funds that are covered by this standard are all trust funds, all special funds that are similar to trust funds, and all fiduciary funds whether or not in the budget.

231. The federal government does not use a consistent fund designation for these types of collections. Funds classified by law as trust funds are established by specific legislation to carry out activities stipulated by law and frequently are financed by taxes. While the Government's use of the term "trust funds" ordinarily differs from use of the term in the private sector, a few trust funds within the federal universe have the stringent fiduciary characteristics similar to those of trust funds in the private sector. Furthermore, some funds within the budget are classified as special funds and are similar in nature to non-fiduciary trust funds within the budget. Providing precise criteria for which non-trust funds are covered by this requirement is difficult. The Board realized that it will not always be easy for management to

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

identify accountability expectations of contributors and beneficiaries.

232. On the other hand, no special accountability of a fund is needed for the sake of those who make voluntary payments in contemporaneous exchange for goods or services. Once goods and services have been rendered for the payment made, the purchaser generally does not expect the fund to provide additional accountability. For this reason the special reporting requirements do not apply to revolving funds or other funds financed similarly. However, special accountability may exist for a revolving fund that collects receipts for goods and services that are expected to be provided at a later period, such as long-term insurance contracts, and preparers are encouraged to provide the needed information in such cases.

233. **Funds not part of the reporting entity's financial statements.** In most cases, the requirement will apply to a fund that is included in the financial statements of the reporting entity. In the case of most fiduciaries, however, the fund is administered by a reporting entity but is not part of the reporting entity itself or included in its own general purpose financial statements. The disclosure requirement applies to such funds as well.

234. **Special reports.** Since the primary purpose of this requirement is accountability to the contributors and expected beneficiaries, all funds that meet the stated criteria are deemed material in this respect. Therefore, information needs to be provided regardless of whether it is material to the reporting entity. However, to minimize the amount of additional information required in financial statements, where the disclosures for dedicated collections are made to the contributors and beneficiaries in special reports and the information required is not material to the reporting entity, minimal disclosures are included in the reporting entity's general purpose financial statements or notes thereto. Special

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

reports provided to representatives of contributors or beneficiaries may satisfy this requirement (for example, a report to an Indian tribal government).

APPENDIX B: GUIDANCE FOR THE CLASSIFICATION OF TRANSACTIONS

INTRODUCTION

235. The Government of the United States has a great many types of transactions that finance its cost of operations, and they must be classified in various ways for revenue accounting in order to achieve the objectives of the standards in this Statement. The type of transaction may be an exchange transaction, a nonexchange transaction, or an other financing source; the transaction may be made between a Government reporting entity and the public or between two reporting entities within the Government (i.e., an intragovernmental transaction). If it is an exchange transaction, it will normally produce revenue but may produce gains and losses. This appendix provides guidance for the classification of specific transactions based on the standards for accounting for revenue and other financing sources, and the reasoning behind these standards as explained in the Introduction and the Basis for Conclusions.

236. To serve that purpose, this appendix provides guidance for classifying all major transactions that finance the Government's cost of operations and a significant number of lesser transactions. It is intended that these classifications--together with the explanation of these classifications, interpreted in the light of the Standards, the Basis for Conclusions, and the Introduction--will provide guidance for classifying all the financing transactions of the Government, including those that are not specifically listed. It should be understood that while some classifications are unequivocal, others are the result of balancing

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

different considerations.

237. The transactions in this appendix are divided into several groups. Transactions recognized in the financial statements have a two-fold division: first, whether they are with the public or intragovernmental; and second, whether they are nonexchange transactions, exchange transactions that produce revenue, exchange transactions that produce gains or losses, or other financing sources. A separate group consists of gains and losses due to revaluation.

238. Exchange transactions are classified as producing gains or losses if they are likely to be unusual or nonrecurring. If the transactions classified in this appendix as gains or losses are usual and recurring for a particular reporting entity, that entity should classify them as producing exchange revenue or expense instead of gains or losses.

239. The final group of transactions in this appendix consists of transactions that produce amounts not recognized as revenues, gains, or other financing sources. Although in some instances there is overlap with other groups, they are presented together as a convenient reference to amounts not classified in any of the other categories. They include:

- A number of transactions in which there is no net inflow of resources (or the net inflow is less than the full amount of the transaction) because one asset is exchanged for another or there is an increase in both assets and liabilities.

- Certain transfers and donations that do not affect net cost or net position.

- A number of transactions involving direct loans and loan guarantees, which are recognized as expenses or reductions in

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

expenses according to the standards in SFFAS No. 2, *Accounting for Direct Loans and Loan Guarantees.*

- Deposit fund transactions.

240. As a guide to this appendix, the following table lists in order the transactions that are illustrated, group by group, and cites the page. Unless otherwise stated:

- Revenue from nonexchange transactions is included in determining the net operating results and hence the change in net position.

- Revenue from exchange transactions is subtracted from gross cost in determining the net cost of operations. (Gains and losses from exchange transactions also affect net cost.)

- Other financing sources are included in determining the net operating results and hence the change in net position.

241. In addition, the collection and disposition of most nonexchange revenue and a small part of exchange revenue is accounted for as a custodial activity of the collecting entity.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

TABLE OF TRANSACTIONS

TRANSACTIONS WITH THE PUBLIC 97

Nonexchange transactions with the public 97

Individual income taxes, corporation income taxes, social insurance taxes and contributions, excise taxes, estate and gift taxes, and customs duties (97)
Social insurance taxes and contributions paid by Federal employees (99)
Deposits by states for unemployment trust fund (99)
User fees, Harbor Maintenance trust fund (100)
Customs Service fees (101)
Deposits of earnings, Federal Reserve System (102)
Donations: except types of property, plant, and equipment that are expensed (103)
Fines and penalties (104)
Penalties due to delinquent taxes in connection with custodial activity (104)
Forfeitures (105)

Exchange transactions with the public: revenue 107

Sales of goods and services (107)
Sales of goods and services in undercover operations (107)
Interest (unless classified elsewhere), dividends, and rents (except for mineral rights) on Government property (108)
Rents, royalties, and bonuses on Outer Continental Shelf (OCS) and other petroleum and mineral rights. (108)
Proceeds from the auction of the radio spectrum (109)
Interest on post-1991 direct loans (110)
Interest on delinquent taxes and other receivables that arise as the result of custodial operations (111)
Regulatory user fees such as patent and copyright fees; immigration and consular fees; SEC registration and filing fees; and Nuclear Regulatory Commission fees (111)
Diversion fees, Department of Justice (112)
Premiums for SMI (Supplementary Medical Insurance), bank deposit insurance, pension benefit guarantees, crop insurance, life insurance, and other insurance (112)
Federal employee contributions to pension and other retirement benefit plans (112)
Federal employee contributions to health benefits plan for current coverage (113)
Reimbursement for collecting revenue (114)
Reimbursement for cleanup costs (115)

Exchange transactions with the public: gains and losses ..115

Sales of Government assets: other than property, plant, and equipment and forfeited and foreclosed property (115)
Sales of property, plant, and equipment (115)
Acquisition of property, plant, and equipment through exchange (116)
Sales of foreclosed property: associated with pre-1992 direct loans and loan guarantees (117)
Sales of receivables: except direct loans (117)
Sales of direct loans (117)

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Retirement of debt securities prior to maturity (118)

Other financing sources from the public 118

Seigniorage (118)

INTRAGOVERNMENTAL TRANSACTIONS 119

Nonexchange transactions--intragovernmental: revenue 119

Interest on Treasury securities held by trust funds and special funds (except trust revolving funds) (119)
Interest received by one fund from another (120)
Employer entity contributions to social insurance programs (120)

Nonexchange transactions--intragovernmental: gains and losses 121

Retirement of debt securities prior to maturity: trust funds and special funds (except trust revolving funds) (121)
Cancellation of debt (122)

Exchange transactions--intragovernmental: revenue 122

Intragovernmental sales of goods and services by a revolving fund (122)
Intragovernmental sales of goods and services by a fund other than a revolving fund (122)
Employer entity contributions to pension and other retirement benefit plans for Federal employees (123)
Employer entity contributions to health benefit plans for current coverage of Federal employees (123)
Employer entity payments for unemployment benefits and workers compensation (124)
Interest on Treasury securities held by revolving funds (124)
Interest on Treasury securities held by trust revolving funds (125)
Interest on uninvested funds received by direct loan and guaranteed loan financing accounts (126)
Interest received by Treasury (126)

Exchange transactions--intragovernmental: gains and losses127

Retirement of debt securities prior to maturity: revolving funds and trust revolving funds (127)

Other financing sources--intragovernmental 128

Appropriations (128)
Cost subsidies: difference between internal sales price (reimbursement) and full cost (128)
Cost subsidies: difference between the service cost of pensions (and other retirement benefits), less the employee contributions, if any, and the employer entity contributions (129)

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Contribution by the General Fund to the SMI trust fund (130)
Transfer by CCC to Federal Crop Insurance Corporation (131)
Interchange between the Railroad Retirement Board and the Social Security and Hospital Insurance trust funds (131)
Transfer of cash and other capitalized assets without reimbursement (132)
Transfer of property, plant, and equipment without reimbursement: types that are expensed (132)

REVALUATIONS 133

Revaluation of capitalized property, plant, and equipment (133)
Revaluation of inventory and related property (133)

TRANSACTIONS NOT RECOGNIZED AS REVENUES, GAINS, OR OTHER FINANCING SOURCES 134

Borrowing from the public (134)
Borrowing from Treasury, the Federal Financing Bank, or other Government accounts (134)
Disposition of revenue to other entities: custodial transfers (134)
Sales of different types of Government assets (135)
Acquisition of property, plant, and equipment through exchange (135)
Transfer of property, plant, and equipment without reimbursement: types that are expensed (136)
Donation of property, plant, and equipment: types that are expensed (137)
Negative subsidies on post-1991 direct loans and loan guarantees (137)
Downward subsidy reestimates for post-1991 direct loans and loan guarantees (137)
Fees on post-1991 direct loans and loan guarantees.-- (138)
Repayment of post-1991 direct loans (138)
Repayment of pre-1992 direct loans (139)
Repayment of receivables: except direct loans (139)
Sales of direct loans (139)
Sales of foreclosed property: associated with post-1991 direct loans and loan guarantees (140)
Deposit fund transactions (140)

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

TRANSACTIONS WITH THE PUBLIC

Nonexchange transactions with the public

242. Individual income taxes, corporation income taxes, social insurance taxes and contributions,[1] excise taxes, estate and gift taxes, and customs duties.--Taxes (including customs duties) are levied through the exercise of the power of the Government to compel payment. In broad terms, taxes are "the price we pay for civilization." More specifically they finance spending of many types to promote the general welfare, provide for the common defense, and ensure domestic tranquillity: national defense, a judicial system, aid to the elderly, construction of infrastructure, education and training, and so forth. The relationship between the tax paid and the value received is too indirect and disproportionate to relate the revenue that is received from any identifiable taxpayer to the cost that is incurred for providing that identifiable taxpayer with benefits. This is especially the case where the benefits are of a collective or public nature, such as national defense, in which case consumption by one taxpayer does not reduce the consumption available for another; or where the benefits are designed to redistribute income from one group of people to another. Therefore, tax revenue is nonexchange revenue.

243. All excise taxes, like other taxes, are classified as resulting in nonexchange revenue. Some excise taxes (considered to be benefit taxes) are levied on bases that are related to the use of publicly provided goods and services or the public provision of other benefits, such as the gasoline tax; certain other excise taxes are levied on bases related to a cause of some damage and are dedicated to pay down costs, such as the tax on domestically mined coal, which is dedicated to the black lung disability

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

trust fund. Even in these cases, however, the relationship between the tax and the benefit received by an identifiable recipient is relatively indirect and disproportionate. Moreover, these excise taxes, like other taxes, are determined through the exercise of the power of the Government to compel payment. Therefore, like other taxes, they are classified as producing nonexchange revenue.

244. Board members have differing views on whether social insurance programs result in exchange or nonexchange transactions.[21].--Taxes (including customs duties) are levied through the exercise of the power of the Government to compel payment. In broad terms, taxes are "the price we pay for civilization." More specifically they finance spending of many types to promote the general welfare, provide for the common defense, and ensure domestic tranquillity: national defense, a judicial system, aid to the elderly, construction of infrastructure, education and training, and so forth. The relationship between the tax paid and the value received is too indirect and disproportionate to relate the revenue that is received from any identifiable taxpayer to the cost that is incurred for providing that identifiable taxpayer with benefits. This is especially the case where the benefits are of a collective or public nature, such as national defense, in which case consumption by one taxpayer does not reduce the consumption available for another; or where the benefits are designed to redistribute income from one group of people to another. Therefore, tax revenue is nonexchange revenue.

243. All excise taxes, like other taxes, are classified as resulting in nonexchange revenue. Some excise taxes (considered to be benefit taxes) are levied on bases that are related to the use of publicly provided goods and services or the public provision of other benefits, such as the gasoline tax; certain other excise taxes are levied on bases related to a cause of some damage and are dedicated to pay down costs, such as the tax on domestically mined coal, which is dedicated to the black lung disability trust fund. Even in these cases, however, the relationship between the tax and the benefit received by an identifiable recipient is relatively indirect and disproportionate. Moreover, these excise taxes, like other taxes, are determined through the exercise of the power of the Government to compel payment.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Therefore, like other taxes, they are classified as producing nonexchange revenue.

244. Board members have differing views on whether social insurance programs result in exchange or nonexchange transactions.[58] However, they agree that social insurance tax revenue should be reported in the same way as other tax revenue for the purposes of financial reporting. This is because social insurance taxes, like other taxes, are determined through the exercise of the power of the Government to compel payment. Furthermore, individuals and businesses subject to social insurance taxes are subject to them as a byproduct of their decision to enter covered employment or engage in a covered business, so especially for the major, broad-based social insurance programs--Social Security, Medicare (hospital insurance), and unemployment compensation--they have virtually no legal option except to pay.

245. Tax receipts are generally collected from the public by the IRS (Internal Revenue Service) and, to a lesser extent, by the Customs Service and other entities acting as agents for the recipient entities rather than on their own behalf. The collecting entity receives the cash and then transfers it to the General Fund, trust fund, or special fund on whose behalf it was collected. The amount so collected should be accounted for as a custodial activity by the collecting entity. The tax is recognized as a nonexchange revenue by the entity that is legally entitled to the amount. This would be a trust fund or special fund in the case of an earmarked (i.e., dedicated) tax. If collected on behalf of the Government as a whole, it would be recognized in the Government-wide consolidated financial statements.

[58] See discussion of social insurance programs in FASAB, Exposure Draft, *Supplementary Stewardship Reporting* (August 1995).

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

246. Social insurance taxes and contributions paid by Federal employees.[22]--Federal employees may be covered by social insurance programs such as Social Security[59] and Medicare under the same terms and conditions as the remainder of the covered population. The payments made by Federal employees are in the nature of taxes, compulsory payments demanded by the Government through the exercise of its power to compel payment. Insofar as the social insurance program applies to employees of the United States government, the terms and conditions are generally the same as the program for private employees. The employer and employee contributions are generally calculated in the same way; the employee contribution is not earned by the social insurance program; and the benefits are generally calculated in the same way. The employee does not obtain particular benefits under the plan from rendering service in Federal employment, because he or she would have been similarly covered by the program if privately employed and would have obtained similar benefits. For these reasons, the employee contribution should have the same classification as contributions by non-Federal employees, which is nonexchange revenue.

247. Deposits by states for unemployment trust fund.--States deposit the receipts from the state unemployment tax to the U.S. Treasury for the unemployment trust fund in order to finance most of the benefits under the unemployment compensation system. The state unemployment tax differs from state to state in terms of the tax rate, tax base, and certain other characteristics, and unemployment benefits also differ from state to state. Nevertheless, the deposit has long been construed as a Federal budget receipt (a governmental receipt), and the unemployment trust fund has long been included as an account in the Federal budget.

[59] Most Federal civilian employees hired before 1984 are not covered by Social Security.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

248. This is for a combination of reasons taken together: (a) the unemployment compensation system--including the system of taxes, the system of benefits, and the trust fund--was established by the Social Security Act of 1935 and has been amended by Federal law many times; (b) deposits are held in a trust fund operated by the U.S. Government; (c) Federal law specifies extensive requirements for the state unemployment tax and unemployment benefits; (d) the Federal unemployment tax finances grants to states to cover their entire cost of administering the unemployment system; and (e) Federal law effectively coerces states to participate in the system, with participation requiring them to levy the state unemployment tax and deposit the collections in the U.S. Treasury. If a state does not participate (or is not certified by the Department of Labor as meeting Federal requirements): (i) the Federal unemployment tax is levied within the state at its maximum rate, (ii) the system does not pay any unemployment compensation benefits within the state, and (iii) the Federal Government provides no grants to state governments to pay for the costs of administration. The deposits of the state tax are therefore nonexchange revenue of the unemployment trust fund. (The Federal unemployment tax is levied and collected separately from the state unemployment tax.)

249. User fees, Harbor Maintenance trust fund. --This is an example of a tax that is termed a "user fee" by law while classified in the budget as a governmental receipt together with other taxes and duties. It is an ad valorem tax of 0.125 percent imposed on commercial cargo loaded and unloaded at specified U.S. ports open to public navigation. The receipt is earmarked to the Harbor Maintenance trust fund. It is similar in nature to other excise taxes that result from the Government’s power to compel payment and that are dedicated to a trust fund or special fund to be spent for a designated purpose (for example, the gasoline excise tax, which is dedicated to the Highway Trust Fund). It therefore should be recognized as nonexchange revenue by the Harbor Maintenance trust fund.

250. Customs Service fees.--The Customs Service collects revenue primarily from duties on imported merchandise but also from two types of fees: the merchandise processing fee and a group of fees called "user fees."

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

251. The merchandise processing fee is primarily an ad valorem charge on formal merchandise entries into the United States (at 0.19 percent) subject to a maximum and minimum charge. It also includes flat fees on informally entered goods. The collections are earmarked by law to a special fund from which receipts are made available to finance Customs Service operations to the extent provided by current appropriations.

252. The merchandise processing fee is associated with the cost of the Customs Service's operations. The fee as originally enacted was modified by the Customs and Trade Act of 1990 to make it consistent with U.S. obligations under GATT (the General Agreement on Tariffs and Trade) after a GATT panel had ruled that the original fee (a straight ad valorem fee) exceeded the cost of services rendered and was a tax on imports that discriminated against imports in favor of domestic production. The maximum and minimum fees and the flat fees were enacted to meet the U.S. obligation.

253. However, the associated cost is primarily some of the costs of assessing and collecting duties on imported merchandise, such as the salaries of import specialists (who classify merchandise) and the costs of processing paperwork. The importer pays duties that are required by law; it does not receive anything of value from the Government in the nature of an exchange. Furthermore, these costs are not likely to depend significantly on the value of the merchandise, and the fee is levied through the power of the Government to compel payment. Therefore, for the purpose of a classification system for financial reporting, the fee is akin to dedicated taxes that are also related in the aggregate to associated costs and that are classified as nonexchange revenue (e.g., the excise tax on gasoline). The merchandise processing fee is therefore classified as a nonexchange revenue.

254. The user fees consist of a group of flat fees charged on passengers and conveyances entering the country.[23] The collections are dedicated by law to a special fund whose receipts are made available by permanent indefinite appropriation to finance Customs Service operations.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

255. These fees are intended to offset certain inspection costs that relate to the processing of passengers and conveyances entering the country. They are levied through the power of the Government to compel payment, and the person or entity that pays these fees does not receive anything of value from the Government in exchange. The inspection activities are for a variety of purposes: to ensure that dutiable merchandise is declared, to seize contraband (such as narcotics and illegal drugs), to detect infringements of patent and copyright laws, and so forth. Some of these purposes are related to the Government's powers to raise taxes, which are nonexchange revenue, and to enforce laws. Only to a limited extent are they like regulatory user fees, based on the Government's power to regulate particular businesses or activities. Therefore, like the merchandise processing fee, the user fees are classified as nonexchange revenue.

256. Deposits of earnings, Federal Reserve System.--The Federal Reserve System consists of the Board of Governors of the Federal Reserve System and twelve regional Federal Reserve Banks. Under Federal accounting concepts, it is not considered to be part of the Government-wide reporting entity. Therefore, payments made to or collections received from the Federal Reserve System would be reported in the financial statements of the Federal Government and its component reporting entities.[24] The Federal Reserve earns large amounts of interest on its portfolio of Treasury securities and deposits to the Treasury all net income after deducting dividends and the amount necessary to bring the surplus of the Federal Reserve Banks to the level of capital paid-in.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

257. The Federal Reserve was established by Act of Congress pursuant to the Government's sovereign power over the nation's money, and its investment in Treasury securities is necessary for carrying out its monetary function. It does not receive anything of value from the Government in exchange for its deposit of earnings, and on occasion it has been required by law to make extra payments. The revenue from the deposits is therefore nonexchange.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

258. Donations: except types of property, plant, and equipment that are expensed.-- Donations are contributions to the Government, i.e., voluntary gifts of resources to a Government entity by a non-Federal entity.[25] The Government does not give anything of value to the donor, and the donor receives only personal satisfaction. The donation of cash, other financial resources, or nonfinancial resources (except stewardship property, plant, and equipment) is therefore a nonexchange revenue.

259. The exception, stewardship PP&E, consists of Federal mission PP&E, heritage assets, and stewardship land. Such PP&E is expensed if purchased, but no amount is recognized if it is received as a donation.[60] Correspondingly, no revenue is recognized for such donations.

260. Fines and penalties.--Fines and penalties are monetary requirements imposed on those who violate laws or administrative rules. The person or other entity that pays a fine or penalty does not receive anything of value in exchange, nor does the Government sacrifice anything of value. The Government collects these amounts through the exercise of its power to compel payment. Fines and penalties are therefore a nonexchange revenue.

261. Fines from judicial proceedings are collected by the entity acting as an agent for the Government as a whole rather than on its own behalf. They are therefore accounted for as a custodial activity of the collecting entity and recognized as a nonexchange revenue in the Government-wide consolidated financial statements.

262. Fines and penalties produced by an entity's operations--such as inspections to ensure compliance with Federal law and with regulations that are the responsibility of the entity (e.g., inspections by the Office of Surface Mining) or compliance with regulations for the conduct of a Federal program--are recognized as nonexchange revenue by whichever entity is legally entitled by law to the revenue. In some cases, but not all, this would be the collecting entity. If the collecting

[60] SFFAS No.6, Accounting for Property, Plant, and Equipment, pp. 18 and 20.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

entity transfers the nonexchange revenue to the General Fund or another entity, the amount is accounted for as a custodial activity by the collecting entity. If transferred to the General Fund, the penalties are recognized as nonexchange revenue in the Government-wide consolidated financial statements; if transferred to another entity, they are recognized as nonexchange revenue by the entity that receives the transfer.

263. Penalties due to delinquent taxes in connection with custodial activity.--The person or other private entity that pays a penalty on delinquent taxes does not receive anything in exchange, nor does the Government sacrifice anything of value. The Government collects these amounts through its power to compel payment. Penalties on delinquent taxes are therefore a nonexchange revenue. The penalties are accounted for as a custodial activity. If transferred to the General Fund, the penalties are recognized as nonexchange revenue in the Government-wide consolidated financial statements; if transferred to another entity, they are recognized as nonexchange revenue by the entity that receives the transfer.

264. Forfeitures.--Property may be seized as a consequence of various laws and regulations and forfeited to the Government. Forfeited property may be acquired through forfeiture proceedings, be acquired to satisfy a tax liability, or consist of unclaimed and abandoned merchandise. Forfeited property is principally managed by the Asset Forfeiture Fund of the Justice Department and the Treasury Forfeiture Fund of the Treasury Department. Revenue is recognized from forfeited property unless the property is distributed to state or local law enforcement agencies or foreign governments or is received in satisfaction of a previously recognized revenue (e.g., accrued tax receivables).[26]

265. The timing of revenue recognition depends on how the property is forfeited and the nature of the property. In the case of unclaimed and abandoned merchandise, revenue is recognized in the amount of the sales proceeds at the time the property is sold. In the case of property acquired through forfeiture proceedings, the timing of recognition depends on the nature and

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

disposition of the property. For monetary instruments, the revenue is recognized at the time of obtaining forfeiture judgment; for property that is sold, at the time of sale; and for property that is held for internal use or transferred to another Federal agency, at the time of obtaining approval to use the property internally or transfer it.[61]

266. The method of measuring revenue depends on the nature of the property. The amount of revenue recognized for monetary instruments is the market value when the forfeiture judgment is obtained. For property that is sold, it is the sales proceeds. For property that is held for internal use or transferred to another Federal agency, it is the fair value of the property less a valuation allowance for any liens or third party claims.

267. The revenue from forfeiture is nonexchange revenue, because the Government seizes the property through the exercise of its power. The Government does not sacrifice anything of value in exchange and the entity that forfeits the property does not receive anything of value. More than half of the forfeiture revenue of the two funds mentioned above is from currency and other monetary instruments. Although other types of forfeited property must be sold in order to recognize revenue, or constructively sold (if transferred to another Federal agency or placed into internal use), this is the last step in a process that is inherently nonexchange.

268. The disposition of the revenue from forfeiture is determined by law. Revenue or the

[61] SFFAS No. 3, 15-19. The standard also requires deferred revenue to be recognized when a forfeiture judgment is obtained, but the deferred revenue is reversed when revenue is recognized. The amount of revenue ordinarily differs from the amount of deferred revenue. In some cases, an adjustment subsequent to the original forfeiture judgment may be necessary when it is later determined that a portion of the forfeiture is to be distributed to state or local law enforcement agencies or foreign governments.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

property itself may ultimately be distributed to the seizing entity, state or local law enforcement agencies, foreign governments, or the general fund. Revenue is recognized as nonexchange revenue by the entity that is legally entitled to use the revenue or to use the property itself. If the property is distributed to a state or local law enforcement agency or a foreign government, revenue is not recognized by a Federal Government reporting entity. If the revenue is transferred to the General Fund, it is recognized as nonexchange revenue in the Government-wide consolidated financial statements.

269. Some entities may be involved in the management and liquidation of forfeited property but not themselves be entitled to the revenue or to the use of the property. For example, a central fund created to support the seizure activities of multiple entities may manage forfeited property and the collection and disposition of the revenue from that property. These entities should account for the property as a custodial activity. Revenue is shown when it is recognized, and it is shown as transferred to others when the cash is disbursed or the property is delivered. The disposition of property to an entity outside the Federal Government is also accounted for.

Exchange transactions with the public: revenue

270. Sales of goods and services.--The cost of production for goods and services such as electricity, mail delivery, and maps is defrayed in whole or in part by revenue from selling the goods or services provided. The sales may be made by a public enterprise revolving fund (such as the Bonneville Power Administration), an intragovernmental revolving fund (such as the Government Printing Office), or a fund that is not a revolving fund (such as the Geological Survey). Each party receives and

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

sacrifices something of value. The sale is therefore an exchange transaction, and the revenue is exchange revenue for the entity making the sale.

271. Sales of goods and services in undercover operations.--The cost of the Government's undercover operations is defrayed in whole or in part from the proceeds of sales of goods that have been purchased (as opposed to goods that have been forfeited). Each party receives and sacrifices something of value. These characteristics of the transaction are not affected by whether the sale is illegal. The sale is therefore an exchange transactions, and the revenue is exchange revenue of the entity making the sale.

272. Interest (unless classified elsewhere), dividends, and rents (except for mineral rights) on Government property.--Each party receives and sacrifices something of value, so the inflow of resources is an exchange transaction.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

273. Interest is classified as exchange revenue notwithstanding the fact that the entity may not be charged a cost of capital for the assets that yield these inflows; or, if the entity borrowed from Treasury to acquire the assets, it may have been charged a below-market interest rate. The gross cost of the entity is understated in such cases; and to recognize an exchange revenue is to recognize a revenue without some or all of the related costs, and hence to understate the entity's net cost of operations. Nevertheless, in some cases the entity does pay the Treasury at least some interest; and the Government's cost of borrowing to acquire the assets is recognized as a cost of the Government as a whole. Since some cost is recognized, even if not always the full cost of the entity,[27] an exchange revenue is recognized for the entity that receives the inflow of interest.

274. Rents, royalties, and bonuses on Outer Continental Shelf (OCS) and other petroleum and mineral rights.--Rents, royalties, and bonuses are exchange revenues, because each party receives and sacrifices something of value. The amounts are earned by sales in the market and therefore are exchange revenue. They are collected by the Minerals Management Service (MMS) of the Department of the Interior, which manages the energy and minerals resources on the OCS and collects the amounts due the Government and Indian tribes from minerals produced on the OCS and other Federal and Indian lands.

275. MMS does not recognize a depletion cost for various reasons, including the fact that under present accounting standards natural resources are not recognized as an asset and depletion is not recognized as a cost. As a result, this exchange revenue bears little relationship to the recognized cost of MMS and cannot be matched against its gross cost of operations. Therefore, although the inflows are exchange revenue, they should not be subtracted from MMS's gross cost in determining its net cost of operations.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

276. MMS should instead account for the exchange revenue as a custodial activity. MMS collects rents, royalties, and bonuses acting as an agent on behalf of the recipients designated by law: the General Fund, certain entities within the Government to which amounts are earmarked, the states, and Indian tribes and allottees. The amounts of revenue should be recognized and measured under the exchange revenue standards when they are due pursuant to the contractual agreement.

277. The rents, royalties, and bonuses transferred to Treasury for the General Fund, or to other Government reporting entities, should be recognized by them as exchange revenue. However, neither the Government as a whole nor the other recipient entities recognize the natural resources as an asset and depletion as a cost. Therefore, this exchange revenue should not offset their gross cost in determining their net cost of operations. It should instead be a financing source in determining their operating results and change in net position.

278. Proceeds from the auction of the radio spectrum.--The proceeds from auctioning the right to use the radio spectrum are exchange revenues, because each party receives and sacrifices something of value. The amount of revenue is earned by sales in the market at auctions. It bears little relationship to the costs recognized by the Federal Communications Commission (FCC), which collects the revenue, or to the costs recognized by the U.S. Government as a whole. Therefore, it should not be offset against the costs of the FCC in determining its net cost of operations or against the costs of the Government as a whole in Government-wide consolidated financial statements.

279. The FCC should therefore account for this exchange revenue as a custodial activity,
acting as an agent on behalf of the General Fund; and it should be included as exchange revenue in the Government-wide consolidated financial statements.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

280. Interest on post-1991[1] direct loans.[28,62]--Interest on direct loans is an exchange transaction, because it is part of a broader exchange transaction in which the entity makes a loan to the borrower and the entity and borrower each receives and sacrifices something of value. Interest on direct loans that are budgeted according to the provisions of the Federal Credit Reform Act of 1990 consists of two components: the nominal interest (the stated interest rate times the nominal principal) and the amortized interest (change in present value of the loans receivable due to the passage of time). The combined effect of these components equals the effective interest, which is directly defined as the present value of the loans receivable times the Treasury interest rate applicable to the particular loans (i.e., the interest rate used to calculate the present value of the direct loans when the direct loans were disbursed). The effective interest causes an equal increase in the aggregate value of the assets on the balance sheet, and therefore the effective interest is the amount recognized as exchange revenue.[63]

[62]For interest on pre-1992 direct loans, see the preceding section on "interest (unless classified elsewhere) . . ."

[63]See SFFAS No. 2, Accounting for Direct Loans and Loan Guarantees, pp. 11-12, paragraphs 30-31 and 37; for an illustrative case study, also see pp. 50-52 and 59-60.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

281. Interest on delinquent taxes and other receivables that arise as the result of custodial operations.--Receivables that arise as the result of custodial operations are custodial (or non-entity) assets, held by the IRS or another entity as an agent for the Government as a whole rather than on its own behalf (e.g., IRS tax receivables on which the delinquent taxpayer must pay interest). The interest is an exchange revenue, because each party receives and sacrifices something of value, but it is not related to the costs incurred by the collecting entity. The interest is accounted for as a custodial activity by the collecting entity. If transferred to the General Fund, the interest is recognized as exchange revenue in the Government-wide consolidated financial statements because it is related to the government's cost of borrowing; if transferred to another entity, it is recognized as nonexchange revenue by the entity that receives the transfer.

282. Regulatory user fees such as patent and copyright fees; immigration and consular fees; SEC registration and filing fees; and Nuclear Regulatory Commission fees.--Regulatory user fees are charges based on the Government's power to regulate particular businesses or activities. The revenue is related to the cost in one of two ways. Special benefits may be provided to identifiable recipients who pay the fees, beyond the benefits, if any, that accrue to the general public (e.g., passport fees); or the Government may incur costs in order to regulate an identifiable entity for the benefit of the general public or some other group, in which case the user charge compensates the Government for its regulatory costs that were caused by the activity of the party that pays the charge (e.g., SEC and Nuclear Regulatory Commission fees). Because in general the revenue is closely related to the cost of operations, these fees are classified as exchange transactions and the revenue is an exchange revenue of the entity that charges the fee.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

283. Diversion fees, Department of Justice.--Registrants in the Diversion Control Program (e.g., physicians) pay fees to the Drug Enforcement Administration, in exchange for which the DEA provides the registrants with the authority to prescribe controlled substances. The diversion fees are intended to cover the costs of the Diversion Control Program. Because the revenue is related to the cost and the registrants both receive and sacrifice value, the payment of these fees is an exchange revenue of the Diversion Control Program.

284. Premiums for SMI (Supplementary Medical Insurance), bank deposit insurance, pension benefit guarantees, crop insurance, life insurance, and other insurance.--In exchange for a premium and other considerations, the Government promises to make payments to program participants if specified events occur. The premium offsets the cost of the program in whole or in part. The degree to which participation is voluntary differs from program to program. Because the revenue is related to the cost of the providing service, it is an exchange revenue of the insurance program.

285. Federal employee contributions to pension and other retirement benefit plans.[29]--Employees of the Federal Government provide service to their employer in exchange for compensation, of which some is received currently (the salary) and some is deferred (pensions, retirement health benefits, and other retirement benefits). This is an exchange transaction, because each party sacrifices value and receives value in return. As part of this exchange transaction, the Government promises a pension to its employees after they retire. The Government also promises other retirement benefits, notably health benefits. In return, the employee provides services and, under some plans, makes a contribution to the retirement fund out of his or her salary. The financing of these benefits may include contributions paid by the employee to the retirement fund.

286. In broad terms, the employee contribution is an inflow of resources to the retirement fund as part of this exchange transaction. More

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

narrowly, it is a payment by the employee as part of an exchange of money and services for a future pension or other retirement benefit. Therefore, it is an exchange revenue of the entity that administers the retirement plan and thus is an offset to that entity's gross cost in calculating its net cost of operations.[64]

287. Federal employee contributions to health benefits plan for current coverage.--Employees of the Federal Government provide services to their employer in exchange for compensation, of which some is received currently in the form of money (the salary); some is received currently in the form of payments to a third party (the employer entity contribution to the medical insurance plan for current coverage of its employees); and some is deferred (pensions and other retirement benefits). This is an exchange transaction, because each party sacrifices value and receives value in return. As part of this exchange transaction, the Government and its employees both contribute to a medical insurance plan that provides current coverage of the employees.

288. In broad terms, the employee contribution out of his or her salary is an inflow of resources to the health benefits plan as part of this exchange transaction. More narrowly, it is a payment in exchange for current coverage by a health benefits plan. Therefore, it is an exchange revenue of the entity that administers the health benefits plan and thus is an offset to that entity's gross cost in calculating its net cost of operations.

[64] For further discussion of the accounting standards for pensions and other retirement benefits of Federal employees, see SFFAS No. 5, Accounting for Liabilities of the Federal Government, pp. 20-36 and 56-63. The standards do not cover accounting for the plan per se as distinct from the administering entity. Nor do they cover defined contribution plans, or administrative entities that are not Federal reporting entities.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

289. Reimbursement for collecting revenue.--The Customs Service collects duties on goods imported by Puerto Rico and the Virgin Islands. The Customs Service retains an amount equal to the estimated cost of collecting these duties, including all costs of operations in Puerto Rico and the Virgin Islands and an allocation of overhead; it transfers the remainder to the Treasury, which, in turn, transfers the collections to Puerto Rico or the Virgin Islands.

290. The total amount of duties collected on these goods should be accounted for as a custodial activity by the Customs Service. Notwithstanding that duties are a nonexchange revenue, these particular duties are a nonexchange revenue of an entity other than the United States and therefore are not recognized as a nonexchange revenue of the U.S. Government.

291. The method of disposing of these collections combines two distinct transactions into one. The entire amount of the duties could be transferred to Puerto Rico and the Virgin Islands, and these governments could then pay the Customs Service to reimburse it for its services of collecting duties. The payment to Customs would be exchange revenue of the Customs Service. The actual procedure for reimbursement, whereby Customs retains an amount equal to the estimated cost, is simpler but equivalent in substance. Hence, the custodial transfer to Treasury (for Puerto Rico and the Virgin Islands) and the amount retained by Customs should be shown as separate components of the disposition of the revenue from customs duties. The amount retained by Customs to reimburse itself for its costs is exchange revenue of the Customs Service and is offset against its gross cost in calculating its net cost of operations.

292. Reimbursement for cleanup costs.--The Coast Guard or other Federal entities may incur costs to clean up environmental hazards caused by private parties and, in some cases, require these private parties to reimburse it for the costs incurred. Notwithstanding that the Government demands the revenue under its power to compel payment, the revenue arises from the action of the private parties and is closely related to the cost of operations incurred as a result of that action. Therefore, the revenue is an exchange revenue of the entity that incurs the cost.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Exchange transactions with the public: gains and losses

293. **Note:** As explained in the introduction to this appendix, transactions that are classified as producing gains or losses should instead be classified as producing revenue or expense if they are usual and recurring for a particular reporting entity.

294. Sales of Government assets: other than property, plant, and equipment and forfeited and foreclosed property.--The sale of Government assets (other than property, plant, and equipment and forfeited and foreclosed property) is an exchange transaction, because each party receives and sacrifices something of value. If the sales price equals book value, there is no gain or loss, because a cash inflow equal to book value is the exchange of one asset for another of equal recorded value and therefore not a net inflow of resources. If the sales price is more or less than the book value of the property, a gain or loss, respectively, is recognized to the extent of the difference. The amount of the difference between sales price and book value is ordinarily a gain or loss rather than a revenue or expense, because sales of property are ordinarily an unusual or nonrecurring inflow of resources.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

295. Sales of property, plant, and equipment.--The transaction is an exchange transaction, because each party receives and sacrifices something of value. If the sales price[30] equals book value, there is no gain or loss, because a cash inflow equal to book value is the exchange of one asset for another of equal recorded value and therefore not a net inflow of resources. If the sales price is more or less than book value, a gain or loss, respectively, is recognized to the extent of the difference. The amount of the difference is ordinarily a gain or loss rather than a revenue or an expense, because sales of property, plant, and equipment are ordinarily an unusual or nonrecurring inflow of resources.

296. The entire sales price is a gain if the book value of the asset is zero. The book value is zero (a) if the asset is general property, plant, and equipment (PP&E) that is fully depreciated or written-off or (b) if the asset is stewardship PP&E, for which the entire cost is expensed when the asset is purchased.[65]

297. Acquisition of property, plant, and equipment through exchange.--The cost of property, plant, and equipment (PP&E) acquired through an exchange of assets with the public is the fair value of the PP&E surrendered at the time of exchange. If the fair value of the PP&E acquired is more readily determinable than that of the PP&E surrendered, the cost is the fair value of the PP&E acquired. If neither fair value is determinable, the cost of the PP&E acquired is the cost recorded for the PP&E surrendered net of any accumulated depreciation or amortization. In the event that cash consideration is included in the exchange, the cost of PP&E acquired is increased (or decreased) by the amount of the cash surrendered (or received).

[65] SFFAS No. 6, Accounting for Property, Plant, and Equipment, has divided property, plant, and equipment (PP&E) into two basic categories: general PP&E and stewardship PP&E (which consists of federal mission PP&E, heritage assets, and stewardship land). General PP&E is capitalized and recognized on the balance sheet; stewardship PP&E is expensed and thus has no book value. (Stewardship PP&E is presented in a stewardship statement.)

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

298. Any difference between the cost of the PP&E acquired and the book value of the PP&E surrendered is recognized as a gain or loss.[31] It is a gain or loss rather than a revenue or expense, because ordinarily the amount would be an unusual or nonrecurring inflow of resources.

299. If the fair value of the PP&E acquired is less than the fair value of the PP&E surrendered, the PP&E acquired is recognized at its cost and subsequently reduced to its fair value. The difference between the cost of the PP&E acquired and its fair value is recognized as a loss.[66]

300. Sales of foreclosed property: associated with pre-1992 direct loans and loan guarantees.--Foreclosed property associated with pre-1992 direct loans and loan guarantees is recognized as an asset at net realizable value. The sale is an exchange transaction, and any difference between the sales proceeds and book value is recognized as a gain or loss.[32]

301. Sales of receivables: except direct loans.--The transaction is an exchange transaction, because each party receives and sacrifices something of value. Upon sale, any difference between the sales proceeds and book value is recognized as a gain or loss. If the sales price equals book value, there is no gain or loss, because the exchange of one asset for another of equal value is not a net inflow of resources.

302. Sales of direct loans.--The sale of a direct loan is a modification according to the Federal Credit Reform Act of 1990, regardless of whether the loan being sold was obligated after FY 1991 or before FY 1992. The book value loss (or gain) on a sale of direct loans equals the book value of the loans sold (prior to sale) minus the net proceeds of the sale. It normally differs from the cost of modification, which is recognized as an expense.[33] Any difference between the book value loss (or gain) and the cost of modification is recognized as a gain or loss.[67]

---

[66] *Ibid.*, footnote 38.

[67] See SFFAS No. 2, Accounting for Direct Loans and Loan Guarantees, pp. 17 and 66-69.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

303. Retirement of debt securities prior to maturity.--Debt securities may be retired prior to maturity if they have a call feature or if they are eligible for redemption by the holder on demand. Many Treasury bonds issued before 1985 are callable; savings bonds, the Government account series, the foreign series, and the state and local series of Treasury securities are redeemable on demand, although sometimes with a penalty or other adjustment or only after a specified period of time.

304. Each party receives and sacrifices something of value in buying and selling debt securities that may be retired prior to maturity. The sales price reflects such features. Therefore, the transaction is an exchange transaction. The difference, if any, between the reacquisition price and the net carrying value of the extinguished debt is recognized as a loss or gain.[34]

Other financing sources from the public

305. Seigniorage.--Seigniorage is the face value of newly minted coins less the cost of production (which includes the cost of the metal, manufacturing, and transportation). It results from the sovereign power of the Government to directly create money and, although not an inflow of resources from the public, does increase the Government's net position in the same manner as an inflow of resources. Because it is not demanded, earned, or donated, it is an other financing source rather than revenue. It should be recognized as an other financing source when coins are delivered to the Federal Reserve Banks in return for deposits.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

INTRAGOVERNMENTAL TRANSACTIONS

Nonexchange transactions-- intragovernmental: revenue

306. Interest on Treasury securities held by trust funds and special funds (except trust revolving funds).--Many trust funds and special funds hold Treasury securities on which they receive interest. In most cases the invested balances of these funds derive predominantly from the funds' earmarked taxes, which are nonexchange transactions with the public (e.g., employment taxes and gasoline taxes), and to a lesser extent from other financing sources received from other government entities (e.g., the General Fund payment appropriated to the Supplementary Medical Insurance fund). The balances are not earned in exchange transactions by the entity's operations. Most fundamentally, they are not produced by operations in which the entity incurs a cost.

307. Therefore, in such cases, the interest on Treasury securities should not be deducted from the gross costs of the trust fund (or special fund), or the organization in which it is administered, in determining its net cost of operations. As a result, that interest should not be classified as exchange revenue. It should instead have the same classification as the predominant source of the invested balances, which for most trust funds (and special funds) is nonexchange revenue. The interest received from invested balances of trust funds and special funds (except trust revolving funds) is therefore normally a nonexchange revenue.

308. The source of balances for some trust funds and special funds may not be predominantly nonexchange revenue. For example, the main source of balances for two major trust funds, the Civil Service Retirement and

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Disability fund and the Military Retirement fund, consists of exchange revenue and other financing sources. In such exceptional cases, as explained in the Basis for Conclusions, the interest should be classified in the same way as the predominant source of balances--in these cases, as exchange revenue--rather than according to the normal rule.

309. Interest received by one fund from another.--One fund within the Government may borrow from another. For example, in 1983 the Old-Age and Survivors Insurance trust fund borrowed from the Disability Insurance and Hospital Insurance trust funds. When that occurs, the lending fund sacrifices interest from Treasury securities on its invested balances and instead receives interest from the borrowing fund on the amount of the loan. Since the predominant source of balances to the lending fund is the same regardless of whether it invests in Treasury securities or lends to another fund, the interest received from the other fund should be classified in the same way--as nonexchange or exchange revenue--as the interest received on Treasury securities.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

310. Employer entity contributions to social insurance programs.[35] --Federal employees may be covered by social insurance programs such as Social Security[68] and Medicare under the same terms and conditions as the rest of the covered population. Intragovernmental contributions to social insurance programs such as Social Security and Medicare are nonexchange transactions, just as payments made by private employers to these programs are nonexchange transactions. Contributions by private employers are in the nature of taxes; i.e., compulsory payments demanded by the Government through the exercise of its power to compel payment. Insofar as the social insurance program applies to Federal employees, the terms and conditions are generally the same as the program for private employees. The employer and employee contributions are generally calculated in the same way; the employer entity contribution is not earned by the social insurance program; and the benefits are generally calculated in the same way. The employee does not obtain particular benefits under the plan from rendering service in Federal employment, because he or she would have been similarly covered by the program if privately employed and would have received similar benefits. For these reasons, the employer entity contribution should have the same classification as private employer contributions, which is nonexchange revenue.

Nonexchange transactions--intragovernmental: gains and losses

[68] Most Federal civilian employees hired before 1984 are not covered by Social Security.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

311. Retirement of debt securities prior to maturity: trust funds and special funds (except trust revolving funds).--Treasury securities held by trust funds and special funds are primarily issued in the Government account series, which can generally be redeemed on demand. Other Treasury securities held by these funds may also be callable or redeemable on demand. If these debt securities are retired before maturity, the difference, if any, between the reacquisition price and the net carrying value of the extinguished debt should be recognized as a gain or loss by the fund that owned the securities. The gain or loss should be accounted for as a nonexchange gain or loss if the interest on the associated debt securities is classified as nonexchange revenue, and it should be accounted for as an exchange gain or loss if the interest on the associated debt securities is classified as exchange revenue. For trust funds (except trust revolving funds) and special funds, as explained elsewhere, the interest is normally but not always a nonexchange revenue.

312. The difference, if any, between the reacquisition price and the net carrying value of the extinguished debt should be recognized as a loss or gain in accounting for interest on Treasury debt. The amount should be equal in absolute value but with the opposite sign to the gain or loss recognized by the trust fund or special fund. The amount should be recognized as a gain or loss from exchange in order to offset it against the gross interest on Treasury debt in the Government-wide consolidated financial statements.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

313. Cancellation of debt.--The debt that an entity owes Treasury (or other agency) may be canceled by Act of Congress. The amount of debt that is canceled (including the amount of capitalized interest that is canceled, if any) is a gain to the entity whose debt is canceled and a loss to Treasury (or other agency). The purpose of borrowing authority is generally to provide an entity with capital rather than to finance its operations. Therefore, the cancellation of debt is not earned by the entity's operations and is not directly related to the entity's costs of providing goods and services. As a result, the cancellation is a nonexchange gain to the entity that owed the debt and a nonexchange loss to the lender.

Exchange transactions--intragovernmental: revenue

314. Intragovernmental sales of goods and services by a revolving fund.--The cost of providing goods or services by a revolving fund is defrayed in whole or in part by selling the goods or services provided. Intragovernmental sales may be made by an organization that maintains either an intragovernmental revolving fund (such as the Defense Business Operations Fund) or a public enterprise revolving fund (such as the Postal Service). Each party receives and sacrifices something of value. The proceeds are an exchange revenue.

315. Intragovernmental sales of goods and services by a fund other than a revolving fund.--The cost of providing goods or services is defrayed in whole or in part by selling the goods or services provided. Each party receives and sacrifices something of value. The proceeds are an exchange revenue.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

316. Employer entity contributions to pension and other retirement benefit plans for Federal employees.--Employees of the Federal Government provide service to their employer in exchange for compensation, of which some is received currently (the salary); and some is deferred (pensions, retirement health benefits, and other retirement benefits). This is an exchange transaction, because each party sacrifices value and receives value in return. As part of this transaction, the Government promises a pension and other retirement benefits (especially health benefits) to the employees after they retire. The financing of these benefits may include contributions paid by the employer entity to the retirement fund.

317. In broad terms, the employer entity contribution is an inflow of resources to the retirement fund as part of this exchange transaction. More narrowly, it is a payment by the employer entity in exchange for the future provision of a pension or other retirement benefit to its employees. Therefore, it is an exchange revenue of the entity that administers the retirement plan and thus is an offset to that entity's gross cost in calculating its net cost of operations.[36]

318. Employer entity contributions to health benefit plans for current coverage of Federal employees.--Employees of the Federal Government provide services to their employer in exchange for compensation, of which some is received currently in the form of money (the salary); some is received currently in the form of payments to a third party (the employer entity contribution to the medical insurance plan for current coverage of the employees); and some is deferred (pensions and other retirement benefits). This is an exchange transaction, because each party sacrifices value and receives value in return. As part of this exchange transaction, the Government and its employees both contribute to a medical insurance plan that provides current coverage of its employees.

319. In broad terms, the employer entity contribution is an inflow of

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

resources to the health benefits plan as part of this exchange transaction. More narrowly, it is a payment in exchange for current coverage of the employer entity's employees by a health benefits plan. Therefore, it is an exchange revenue of the entity that operates the health benefits plan and thus is an offset to that entity's gross cost in determining its net cost of operations.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

320. Employer entity payments for unemployment benefits and workers compensation.--The employer entity recognizes a liability and an expense for Federal employees who are laid-off or injured on the job and are entitled under law to unemployment benefits or workers compensation, respectively.[37] The payment to the former or current employee is made by the unemployment trust fund (Department of Labor) in the case of unemployment benefits and by the special benefits fund (Department of Labor) in the case of workers compensation. Unemployment benefits are reimbursed by the former employer entity; and workers compensation costs are mostly charged back to the employer entity.

321. Since the costs are recognized by the employer entity and its payment to the unemployment trust fund or the special benefits fund reimburses these funds for the costs they incur, the amounts these funds receive from the employer entity are exchange revenues.

322. Interest on Treasury securities held by revolving funds.--A revolving fund conducts a cycle of business-type operations in which the expenses are incurred to produce goods and services that generate revenue, and the revenue, in turn, finances expenses. Revolving funds need capital in their operations and may invest some of that capital in Treasury securities. Since their holding of invested balances and the sale of goods and services are both integral to the funds' operations, the interest on the funds' securities is related to the funds' cost of operations just as is the revenue earned from selling goods and services. Furthermore, the source of the invested balances is predominantly revenue earned from their sales of goods and services, for which the funds incurred costs of operations when that revenue was earned. The interest they receive should therefore be classified in the same way as their revenue earned from selling goods and services and should likewise be deducted from gross cost in determining the net cost of operations. For this reason, interest earned by revolving funds should normally be classified as exchange revenue.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

323. The source of balances for some revolving funds may not be predominantly exchange revenue. For such exceptions, as explained in the Basis for Conclusions, the interest should be classified in the same way as the predominant source of balances rather than according to the normal rule.

324. Interest on Treasury securities held by trust revolving funds.--A trust revolving fund is a revolving fund that is also classified by law as a trust fund. Like other revolving funds, it earns exchange revenue, which is an offset to its gross cost. For example, the revenue that the Employees Health Benefit fund earns from contributions by Federal employees, annuitants, employer entities, and the Office of Personnel Management (OPM) is an offset to the insurance premiums that it pays to private firms. Trust revolving funds need capital in their operations, just like other revolving funds, the source of which is predominantly the revenue they have earned. When some of their capital is invested in Treasury securities, the interest is related to their cost of operations in the same way as the revenue earned from selling services. Furthermore, the source of the invested balances is predominantly revenue earned from the sales of services, for which they incurred costs of operations when the revenue was earned. The interest they receive should therefore be classified in the same way as the interest received by other revolving funds, which is exchange revenue.

325. The source of balances for some trust revolving funds may not be predominantly exchange revenue. For such exceptions, as explained in the Basis for Conclusions, the interest should be classified in the same way as the predominant source of balances rather than according to the normal rule.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

326. Interest on uninvested funds received by direct loan and guaranteed loan financing accounts.--A guaranteed loan financing account holds uninvested balances as reserves against its loan guarantee liabilities and earns interest on these balances that adds to its resources to pay these liabilities. A direct loan financing account may hold uninvested balances to bridge transactions that are integral to its operations, such as when it borrows from Treasury to disburse direct loans prior to the time of disbursement; it earns interest on these balances to reflect the time value of money and thereby finance the interest it pays on its debt to Treasury. Thus, in both cases, the interest received by the financing account is earned through exchange transactions with Treasury and is an offset to the financing account's related costs of operations. The interest is therefore an exchange revenue of the financing account.

327. Interest received by Treasury.--Accounts or funds (including direct loan and guaranteed loan financing accounts) may be authorized to borrow from the Treasury or from the Federal Financing Bank (an entity within Treasury) or other sources. The interest that the entity pays on its borrowings is a cost to the entity and an inflow of resources to the Treasury. The Treasury may be deemed to have borrowed from the public to finance the outlays for which the entity borrowed, and thus to have incurred a corresponding interest cost of its own. The interest received by Treasury from the entity is therefore related to Treasury's cost of borrowing from the public and should be classified as an exchange revenue.

Exchange transactions--intragovernmental: gains and losses

328. **Note:** As explained in the introduction to this appendix, transactions that are classified as producing gains or losses should instead be classified as producing revenue or expense if they are usual and recurring for a particular reporting entity.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

329. Retirement of debt securities prior to maturity: revolving funds and trust revolving funds.--Treasury securities held by revolving funds and trust revolving funds are primarily issued in the Government account series, which can generally be redeemed on demand. Other Treasury securities held by these funds may also be callable or redeemable on demand. If these debt securities are retired before maturity, the difference, if any, between the reacquisition price and the net carrying value of the extinguished debt should be recognized as a gain or loss by the fund that owned the securities. The gain or loss should be accounted for as a nonexchange gain or loss if the interest on the associated debt securities is classified as nonexchange revenue, and it should be accounted for as an exchange gain or loss if the interest on the associated debt securities is classified as exchange revenue. For revolving funds and trust revolving funds, as explained elsewhere, the interest is normally but not always an exchange revenue.

330. The difference, if any, between the reacquisition price and the net carrying value of the extinguished debt should be recognized as a loss or gain in accounting for interest on Treasury debt. The amount should be equal in absolute value but with the opposite sign to the gain or loss recognized by the revolving fund or trust revolving fund. The amount should be recognized as a gain or loss from exchange in order to offset it against the gross interest on Treasury debt in the Government-wide consolidated financial statements.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Other financing sources--intragovernmental

331. Appropriations.--Appropriations--a form of budget authority--permit an entity to incur obligations and make payments and thus are a means of financing the entity's cost. They are not otherwise related to the entity's cost and therefore are not an offset to its gross cost in determining its net cost of operations. They are not earned by the entity's activities, demanded by the entity, or donated to the entity. Therefore, appropriations provide an other financing source instead of a revenue.

332. More precisely, "appropriations used" is recognized as an other financing source in determining the entity’s operating results when the entity receives goods and services or provides benefits, grants, or other transfer payments. To avoid double counting, appropriations used are **not** recognized for the appropriation of earmarked revenues or other financing sources, which are already counted in determining the entity’s operating results. Appropriations that have been made available for apportionment but have not been used are recognized as “unexpended appropriations” in the entity’s capital.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

333. Cost subsidies: difference between internal sales price (reimbursement) and full cost.--One entity may receive goods or services from another entity without paying the full cost of the goods or services or without paying any cost at all. Other Federal accounting standards may require the receiving entity to recognize the full cost as an expense (or, if appropriate, as an asset). In these cases the difference between full cost and the internal sales price or reimbursement (sometimes called a "transfer price") is an imputed cost to the receiving entity.[38]

334. The financing of the imputed cost is also imputed to the receiving entity. Imputed financing is necessary so that the imputed cost does not reduce the entity's operating results and net position. The imputed financing equals the imputed cost and is recognized as an other financing source. It is not a revenue, because the receiving entity does not earn the amount imputed or demand its payment.

335. Cost subsidies: difference between the service cost of pensions (and other retirement benefits), less the employee contributions, if any, and the employer entity contributions.--The service cost of pensions (and other retirement benefits) to the employer entity, less the employee contributions, if any, is recognized as a cost to the employer entity. The difference between the employer entity's cost and its contributions, if any, is imputed to the employer entity as part of its recognized cost. For pensions, the cost recognized by the employer entity is more than its contribution for employees who are covered by the Civil Service Retirement System and several minor systems (in a few of which the employer entity does not make any contributions toward the service cost). For retirement health care benefits, neither the employees nor the employer entity make any contributions while the employee is working.[39] Therefore, the entire service cost is recognized as a cost to the employer entity and imputed to it.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

336. The financing of the imputed cost is also imputed to the employer entity.[69] The imputed financing is necessary so that the imputed cost does not reduce the employer entity's operating results and net position. The imputed financing equals the imputed cost and is recognized as an other financing source. It is not a revenue, because the employer entity does not earn the amount imputed or demand its payment.[70]

337. (This transaction differs from the immediately preceding transaction, in which an entity does not pay the full cost of the goods or services it receives from another entity. In the present case, the employer entity acquires the services of the employees itself, but another entity pays part of their cost.)

338. Contribution by the General Fund to the SMI trust fund.--The General Fund makes a contribution to the SMI (Supplementary Medical Insurance) trust fund. This appropriated payment is separate from the transfer of earmarked premiums and is not a transfer of earmarked taxes or other income. It does not arise from an exchange transaction, because SMI does not sacrifice any value to the General Fund in exchange for the payment, and the General Fund does not receive anything of value from SMI. Instead, the payment constitutes a General Fund subsidy of the SMI trust fund. Since the payment is not demanded or earned, it is an other financing source to SMI rather than a revenue.

---

[69] The employer entity's own contribution, if any, is generally financed by an appropriation but could be financed by earned revenue or other sources.

[70] For further discussion of the accounting standards for pensions and other retirement benefits for federal employees, see SFFAS No. 5, Accounting for Liabilities of the Federal Government, pp. 20-36 and 56-63. The standards do not cover accounting for the plan per se as distinct from the administering entity. Nor do they cover defined contribution plans, or administrative entities that are not Federal reporting entities.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

339. Examples of other payments of a similar nature (and also classified as other financing sources) are the payment by the General Fund to the social security trust funds for military service credits and for certain uninsured persons at least 72 years old; and the payment by the General Fund to the Railroad Retirement Board for the vested dual benefit payments received by certain retirees under both the railroad retirement and the social security systems. The quinquennial military service credit adjustment paid between the General Fund and the social security trust funds is likewise an other financing source to the social security trust funds but one that may be either positive or negative.

340. Transfer by CCC to Federal Crop Insurance Corporation.--The Commodity Credit Corporation (CCC) makes transfers to the Federal Crop Insurance Corporation (FCIC), which it finances by an appropriation. This payment does not arise from an exchange transaction, because FCIC does not sacrifice anything of value to CCC, and CCC does not receive anything of value from FCIC. It differs from the contribution to SMI primarily in that it is paid by another program entity (the CCC) rather than directly by the General Fund. Since the payment is not demanded or earned, it is an other financing source to FCIC rather than a revenue.

341. Interchange between the Railroad Retirement Board and the Social Security and Hospital Insurance trust funds.--The Railroad Retirement Board pays benefits equivalent to the amounts that would have been paid if railroad workers had been covered under Social Security since its inception, plus additional amounts unique to that program. The railroad retirement program is partly financed by an annual financial interchange that takes place between the Railroad Social Security Equivalent Benefit Account (a trust fund) and the trust funds for old-age and survivors insurance, disability insurance, and hospital insurance (OASDHI). The interchange is designed to place each of the OASDHI trust funds in the same position as it would have been if railroad employment had been covered under Social Security since its inception.

342. The amount of the payment reflects the difference between (a) the benefits that the OASDHI trust funds would have paid to railroad workers and their families if railroad employment had been covered by

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

OASDHI and (b) the payroll taxes that the OASDHI trust funds would have received if railroad employment had been covered by OASDHI. If benefits would have exceeded taxes, the OASDHI trust funds make a payment to the Railroad Social Security Equivalent Benefit Account; if benefits would have been less, the OASDHI trust funds receive a payment. Currently OASI and DI make payments to that Account, and HI receives payment. The interchange differs from the examples in the previous cases primarily in that (a) the payment is between two trust funds and (b) the payment may be made in either direction.

343. The financial interchange does not arise from an exchange transaction, because it is a reallocation of resources among funds, all of which are financed primarily from nonexchange revenue. Furthermore, the nature of this reallocation is such that the transferring entity does not receive anything of value and the recipient entity does not sacrifice anything of value. Therefore, the recipient entity recognizes the transfer-in as an other financing source, and the transferring entity recognizes the transfer-out as a negative financing source.

344. Transfer of cash and other capitalized assets without reimbursement.--Cash and other capitalized assets may be transferred without reimbursement from one Government entity to another. Cash may include exchange revenue that is recognized by the transferring entity in determining its net cost of operations but is required to be transferred to the General Fund or another entity; other capitalized assets may include general property, plant, and equipment. The receiving entity does not sacrifice anything of value, and the transferring entity does not acquire anything of value. Therefore, the transfer is not an exchange transaction. The receiving entity recognizes the transfer-in as an other financing source; the transferring entity recognizes the transfer-out as a negative financing source. The amount recorded by both entities is the transferring entity's book value of the asset.

345. Transfer of property, plant, and equipment without reimbursement: types that are expensed.--Property, plant, and equipment (PP&E) of types that are expensed (i.e., stewardship PP&E) may be transferred from one Government entity to another. If the asset

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

was classified as stewardship PP&E in its entirety by both the transferring entity and the recipient entity, the transfer does not affect the net cost of operations or net position of either entity and therefore in such a case it is not a revenue, a gain or loss, or other financing source.

346. However, if the asset that is transferred was classified as general PP&E for the transferring entity but stewardship PP&E for the recipient entity, it is recognized as a transfer-out (a negative other financing source) of capitalized assets by the transferring entity.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

REVALUATIONS

347. Revaluation of capitalized property, plant, and equipment.--Capitalized property, plant, and equipment (PP&E) may be removed from the general PP&E accounts if it no longer provides service in the operations of the entity because it has suffered damage, become obsolete in advance of expectations, or is identified as excess. It is recorded as an asset at its expected net realizable value. Any difference between the book value and the expected net realizable value is recognized as a gain or loss in determining the net cost of operations, because the revaluation results from the entity's operations. The expected net realizable value is adjusted at the end of each period, and any further revaluation is also recognized as a gain or loss in determining the net cost of operations.[40]

348. Since the revaluation does not affect obligations incurred but does affect net cost, an amount equal to the revaluation is recognized in determining the reconciliation between obligations incurred and net cost of operations. A reconciliation is not needed in determining the change in net position, because the revaluation affects net cost and net position equally.

349. Revaluation of inventory and related property.--Inventory and related property may be revalued for such reasons as determination that the property is excess, obsolete, or unserviceable; that stockpile materials have decayed or been damaged; that a loss is estimated on commodity purchase agreements; or that a change has occurred in the net realizable value of commodities valued at the lower of cost or net realizable value. The amount of revaluation is recognized as a loss or a gain in determining the net cost of operations, because it results from the entity's operations. Assets are correspondingly reduced or increased.[41]

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

350. Since the revaluation does not affect obligations incurred, but does affect net cost, an amount equal to the revaluation is recognized in determining the reconciliation between obligations incurred and net cost of operations. A reconciliation is not needed in determining the change in net position, because the revaluation affects net cost and net position equally.

TRANSACTIONS NOT RECOGNIZED AS REVENUES, GAINS, OR OTHER FINANCING SOURCES

351. Borrowing from the public.--Borrowing from the public is a means of financing the Government's outlays. However, it is not a net inflow of resources to the Treasury or other borrowing entity, because the asset received (cash) is offset by an equal liability (debt). Therefore, it is not revenue or an other financing source.

352. Borrowing from Treasury, the Federal Financing Bank, or other Government accounts.-- An entity may be provided the authority to borrow from Treasury, the Federal Financing Bank, or other Government accounts. Intragovernmental borrowing is a means of financing the entity's outlays. However, it is not a net inflow of resources to the entity, because the asset received (cash) is offset by an equal liability (debt). Therefore, it is not revenue or an other financing source.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

353. Disposition of revenue to other entities: custodial transfers.--Revenue, primarily nonexchange revenue, may be collected by an entity acting on behalf of the General Fund or another entity within the Government on whose behalf it was collected. The collecting entity accounts for the disposition of revenue as part of its custodial activity. These custodial transfers, by definition, do not affect the collecting entity's net cost of operations or operating results, nor are they part of the reconciliation between its obligations and net cost of operations. (The receiving entity recognizes the revenue as nonexchange or exchange revenue, depending on its nature, according to the applicable revenue standards.)

354. Sales of different types of Government assets.--The sale of Government assets (other than forfeited property) is an exchange transaction, because each party receives and sacrifices something of value. As a general rule, any difference between the sales proceeds and book value is recognized as a gain or loss when the asset is sold. The remainder of the transaction does not provide a net inflow of resources, so no gain, revenue, or other financing source is recognized. If the sales proceeds equal book value, there is no gain or loss, because the exchange of one asset for another of equal recorded value is not a net inflow of resources.

355. This general rule applies to property, plant, and equipment, receivables (other than direct loans), foreclosed property associated with pre-1992 direct loans and loan guarantees, and miscellaneous assets. It does not apply to inventory, nor does it apply to forfeited property (as explained in the previous section on nonexchange revenue). It also does not apply to the sale of direct loans and the sale of foreclosed property associated with post-1991 direct loans and loan guarantees. The latter transactions are discussed in subsequent paragraphs.

356. Acquisition of property, plant, and equipment through exchange.--The cost of property, plant, and equipment (PP&E) acquired through an exchange of assets with the public is the fair value of the PP&E surrendered at the time of exchange. If the fair value of the PP&E acquired is more readily determinable than that of the PP&E surrendered, the cost is the fair value of the PP&E acquired. If neither

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

fair value is determinable, the cost of the PP&E acquired is the cost recorded for the PP&E surrendered net of any accumulated depreciation or amortization. In the event that cash consideration is included in the exchange, the cost of PP&E acquired is increased (or decreased) by the amount of the cash surrendered (or received).[42]

357. Any difference between the cost of the PP&E acquired and the book value of the PP&E surrendered is recognized as a gain or loss. If the cost of the PP&E acquired equals the book value of the PP&E surrendered, there is no gain or loss (nor a revenue or other financing source), because the exchange of one asset for another of equal value does not provide a net inflow of resources. Therefore, the amount of the transaction equal to the book value of the PP&E surrendered is not recognized as a gain, a revenue, or an other financing source.

358. Transfer of property, plant, and equipment without reimbursement: types that are expensed.--Property, plant, and equipment (PP&E) of types that are expensed (i.e., stewardship PP&E) may be transferred from one Government entity to another. If the asset was classified as stewardship PP&E in its entirety by both the transferring entity and the recipient entity, the transfer does not affect the net cost of operations or net position of either entity and therefore in such a case it is not a revenue, a gain or loss, or other financing source.

359. However, if the asset that is transferred was classified as general PP&E for the transferring entity but stewardship PP&E for the recipient entity, it is recognized as a transfer-out (a negative other financing source) of capitalized assets by the transferring entity.

360. If multi-use heritage assets are transferred and some cost was recognized for them on the books of the transferring entity, that cost is recognized as a transfer-out (a negative other financing source) of capitalized assets. No amount is recognized by the entity that receives the asset.[43]

361. Donation of property, plant, and equipment: types that are

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

expensed.--The acquisition cost of stewardship property, plant, and equipment (PP&E) is recognized as a cost when incurred. Such PP&E consists of Federal mission PP&E, heritage assets, and stewardship land. When such PP&E is donated to the Government, however, no amount is recognized as a cost.[44] Since the donation of such PP&E does not affect the net cost or net position of the recipient entity, it is not a revenue, a gain, or an other financing source.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

362. Negative subsidies on post-1991 direct loans and loan guarantees.--A negative subsidy means that the direct loans or loan guarantees are estimated to make a profit, apart from administrative costs (which are excluded from the subsidy calculation by law). The amount of the subsidy cost is recognized as an expense when the direct loan or guaranteed loan is disbursed. A negative subsidy is recognized as a direct reduction in expense, not as a revenue, gain, or other financing source.[45]

363. Downward subsidy reestimates for post-1991 direct loans and loan guarantees.--A downward subsidy reestimate means that the subsidy cost of direct loans or loan guarantees is estimated to be less than had previously been estimated. The initial subsidy cost is recognized as an expense; a positive subsidy reestimate is recognized as an expense; and a downward subsidy reestimate is recognized as a direct reduction in expense, not as a revenue, gain, or other financing source.

364. Fees on post-1991 direct loans and loan guarantees.--The present value of estimated fees is included as an offset in calculating the subsidy cost of direct loans and loan guarantees, which is recognized as an expense when the loans are disbursed. The present value of estimated fees is likewise included as one component in calculating the value of loans receivable or loan guarantee liabilities. When cash is received in payment of fees, the loans receivable decrease by an equal amount (or the loan guarantee liabilities increase by an equal amount). The increase in one asset is offset by an equal decrease in another asset (or by an equal increase in liabilities). Therefore, fees are not recognized as a revenue, a gain, or an other financing source.[46]

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

365. Repayment of post-1991 direct loans.--The present value of estimated loan repayments is included in the calculation of the subsidy cost of direct loans, and this subsidy cost is recognized as an expense when the loans are disbursed. The present value of estimated loan repayments is likewise included in the value of the loans receivable. When cash is received for the repayment of loans, the loans receivable decrease by an equal amount. The increase in one asset is offset by an equal decrease in another asset. Therefore, cash inflow from the repayment is not recognized as a revenue, a gain, or an other financing source.[47]

366. Repayment of pre-1992 direct loans.--When pre-1992 direct loans are repaid in whole or in part, the entity exchanges one asset (loans receivable) for another (cash) with equal value. There is no net inflow of resources. Therefore, the amount of cash inflow equal to book value is not recognized as a revenue, a gain, or an other financing source.[48]

367. Repayment of receivables: except direct loans.--When receivables other than direct loans are paid or repaid in whole or in part, the entity exchanges one asset (loans receivable) for another (cash) with equal value. There is no net inflow of resources. Therefore, the amount of cash inflow equal to book value is not recognized as a revenue, a gain, or an other financing source.[49]

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

368. Sales of direct loans.--The sale of a direct loan is a modification according to the Federal Credit Reform Act of 1990 regardless of whether the loan being sold was obligated after FY 1991 or before FY 1992. The book value loss (or gain) on a sale of direct loans equals the book value of the loans sold (prior to sale) minus the net proceeds of the sale. It normally differs from the cost of modification, which is recognized as an expense.[50] Any difference between the book value loss (or gain) and the cost of modification is recognized as a gain or loss.[71] The amount of cash inflow equal to book value is not a net inflow of resources to the entity, because it is an exchange of one asset for another of equal recorded value. Therefore, the amount of cash inflow equal to book value is not recognized as a revenue, a gain, or an other financing source.

369. Sales of foreclosed property: associated with post-1991 direct loans and loan guarantees.--The net present value of the cash flow from the estimated sales of foreclosed property is included in calculating the subsidy cost of post-1991 direct loans and loan guarantees. This subsidy cost is recognized as an expense when the loans are disbursed. When property is foreclosed, the property is recognized as an asset at the net present value of its estimated net cash flows. When the foreclosed property is sold, any difference between the sales proceeds and the book value (i.e., the net present value as of the time of sale) requires a reestimate of the subsidy expense, which is recognized as a subsidy expense or a reduction in subsidy expense. The amount of cash flow equal to book value is an exchange of one asset for another of equal recorded value and therefore is not recognized as a gain, a revenue, or an other financing source.[51]

[71] SFFAS No. 2, Accounting for Direct Loans and Loan Guarantees, pp. 17 and 66-69.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

370. Deposit fund transactions.--Deposit funds are accounts outside the budget that record amounts that the Government (a) holds temporarily until ownership is determined or (b) holds as an agent for others. The standards and guidance in this Statement do not apply to deposit funds except insofar as a particular deposit fund may be classified as part of a Federal reporting entity or a disclosure may be required due to a fiduciary relationship on the part of a Federal reporting entity toward a deposit fund.

APPENDIX C: GLOSSARY

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

This glossary provides definitions for many terms used in this Statement. The definitions may be modified or superseded when relevant terms are considered or defined by the Board in future projects.

Abatement

A reduction or cancellation of an assessed tax. (Cooper W, Ijiri Y, Kohler's Dictionary for Accountants, 6th ed., Englewood Cliffs, NJ: Prentice-Hall, 1983)

Apportionment

A distribution made by OMB of amounts available for obligation in an appropriation or fund account into amounts available for specified time periods, programs, activities, projects, objects, or combinations thereof. The apportioned amount limits the obligations that may be incurred. (OMB Circular A-34)

Assessments

Enforceable claims for nonexchange revenue for which specific amounts due have been determined and the person from whom the tax or duty is due has been identified. They include both self- assessments made by persons filing tax returns and assessments made by the collecting entities as a result of audits, investigations, and litigation. Although the term is normally used in connection with taxes, as used in this Statement assessments also include determinations of amounts due for any other kind of nonexchange revenue. Specifically excluded from the definition of assessments, as used in this Statement, are compliance assessments. Compliance assessments, as defined by IRS and Customs, do not represent financial receivables.

Basic Financial Statements

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

As used in this Statement, the basic financial statements are those on which an auditor would normally be engaged to express an opinion. The term "basic" does not necessarily mean that other financial information not covered by the auditor's opinion is less important to users than that contained in the basic statements; it merely connotes the expected nature of the auditor's review of, and association with, the information.

The basic financial statements in financial reports prepared pursuant to the Chief Financial Officers Act, as amended, are called the "principal financial statements." The Form and Content of these statements are determined by OMB.

Budget Authority

The authority provided by Federal law to incur financial obligations that will result in immediate or future outlays. Specific forms of budget authority include:

- appropriations, which may be provided in appropriations acts or other laws and which permit obligations to be incurred and payments to be made;

- borrowing authority, which permits obligations to be incurred but requires funds to be borrowed to liquidate the obligation;

- contract authority, which permits obligations to be incurred but requires a subsequent appropriation or offsetting collections to liquidate the obligations; and

- spending authority from offsetting collections, which permits offsetting collections to be credited to an expenditure account and permits obligations and payments to be made using the offsetting collections (the offsetting collections credited to an account are deducted from gross budget authority of the account.)

Budget authority may be classified by period of availability (one year, multiple-year, or no year), by nature of the authority (current or permanent), by the manner of determining the amount available (definite or indefinite), or as gross (without reduction of offsetting

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

collections) and net (with reductions of offsetting collections). (OMB Circular A-11; OMB, The Budget System and Concepts, 1996; and GAO, A Glossary of Terms Used in the Federal Budget Process, Exposure Draft, January 1993)

Budgetary Accounting

Budgetary accounting is the system that measures and controls the use of resources according to the purposes for which budget authority was enacted; and that records receipts and other collections by source. It tracks the use of each appropriation for specified purposes in separate budget accounts through the various stages of budget execution from appropriation to apportionment and allotment to obligation and eventual outlay. This system is used by the Congress and the Executive Branch to set priorities, to allocate resources among alternative uses, to finance these resources, and to assess the economic implications of federal financial activity at an aggregate level. Budgetary accounting is used to comply with the Constitutional requirement that "No Money shall be drawn from the Treasury, but in Consequence of Appropriations Made by Law; and a regular Statement and Account of the Receipts and Expenditures of all public Money shall be published from time to time." (See Statement of Federal Financial Accounting Concepts No. 1, Objectives of Federal Financial Reporting, September 1993:15, 35-36, and 61-62.)

Cost

Defined in SFFAC No. 1, Objectives of Federal Financial Reporting as the monetary value of resources used (para. 195). Defined more specifically in SFFAS No. 4, Managerial Cost Accounting Concepts and Standards for the Federal Government, as the monetary value of resources used or sacrificed or liabilities incurred to achieve an objective, such as to acquire or produce a good or to perform an activity or service (page 105). Depending on the nature of the transaction, cost may be charged to operations immediately, i.e., recognized as an expense of the period, or to an asset account for recognition as an expense of subsequent periods. In most contexts within Accounting for Revenue and Other Financing Sources, "cost" is used synonymously with expense. See also "Full Cost."

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Dedicated Collections (or Taxes)

See "earmarked taxes."

Directed Flows of Resources

Expenses to nonfederal entities imposed by federal laws or regulations without providing federal financing. In the case of state and local governments, directed flows are known as "unfunded mandates." The costs and financing of federal regulations do not flow through the Government, but their effects are similar to direct federal expenditures and revenue.

Drawbacks

Refunds of all or part of duties on imported goods that are subsequently exported or destroyed. Typically these arise when imported materials are used to manufacture a product that is later exported. In such cases, most of the duties originally paid are refundable when the finished product is exported.

Earmarked Taxes

Taxes levied by the Government that are dedicated by law to finance a specific federal program. (SFFAS No. 5, Accounting for Liabilities of the Federal Government, page 71.)

Exchange Revenue

Inflows of resources to a governmental entity that the entity has earned. They arise from exchange transactions, which occur when each party to the transaction sacrifices value and receives value in return.

Expended Appropriations

The dollar amount of appropriations used to fund goods and services received or benefits or grants provided.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Full Cost

The total amount of resources used to produce the output. More specifically, the full cost of an output produced by a responsibility segment is the sum of (1) the costs of resources consumed by the responsibility segment that directly or indirectly contribute to the output, and (2) the costs of identifiable supporting services provided by other responsibility segments within the reporting entity and by other reporting entities. (SFFAS No. 4, *Managerial Cost Accounting Concepts and Standards for the Federal Government*, p. 36) All direct and indirect costs to any part of the Federal Government of providing goods, resources, or services. (OMB Circular A-25).

General Fund

Accounts for receipts not earmarked by law for a specific purposes, the proceeds of general borrowing, and the expenditure of these moneys. (OMB, The Budget System and Concepts)

General Purpose Financial Reports

Reports intended to meet the common needs of diverse users who typically do not have the ability to specify the basis, form, and content of the reports they receive.

Governmental Receipts

Collections from the public that result primarily from the exercise of the Government's sovereign or governmental powers. Governmental receipts consist mostly of individual and corporation income taxes and social insurance taxes but also include excise taxes, compulsory user charges, customs duties, court fines, certain license fees, gifts and donations, and deposits of earnings by the Federal Reserve System. They are compared to outlays in calculating a surplus or deficit. (OMB, The Budget System and Concepts)

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Nonexchange Revenue

Inflows of resources to the Government that the Government demands or that it receives by donations. The inflows that it demands include taxes, duties, fines, and penalties.

Offsetting Collections

Collections from the public that result from business-type or market-oriented activities and collections from other Government accounts. These collections are deducted from gross disbursements in calculating outlays, rather than counted in governmental receipts. Some offsetting collections are credited directly to appropriation or fund accounts; others, called offsetting receipts, are credited to receipt accounts. The authority to spend offsetting collections is a form of budget authority. (OMB, The Budget System and Concepts)

Other Financing Sources

Inflows of resources that increase net position of a reporting entity but that are not revenues or gains. Borrowing is not included as other financing sources, since it does not increase the net resources of the reporting entities.

Proprietary Accounting

Also known as financial accounting, a process that supports accrual accounting and financial reporting that attempts to show actual financial position and results of operations by accounting for assets, liabilities, net position, revenues, and expenses. (See Tierney, Cornelius E., Handbook of Federal Accounting Practices, Reading Massachusetts: Addison-Wesley, 1982:122).

Revenue Adjustment

A contra revenue account that is used to report reduction in revenue when realization is not probable (less likely than not). It includes , returns, allowances, and price redeterminations but not credit losses (due to the inability of the debtor to pay the established or negotiated price).

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Revolving Fund

A fund consisting of permanent appropriation and expenditures of collections, from both the public and other Governmental agencies and accounts, that are earmarked to finance a continuing cycle of business-type operations. (OMB Circular A-34)

Special Fund

Federal fund accounts for receipts earmarked for specific purposes and the associated expenditure of those receipts. (OMB, The Budget System and Concepts)

Tax Expenditure

A revenue forgone attributable to a provision of the federal tax laws that allows a special exclusion, exemption, or deduction from gross income or provides a special credit, preferential tax rate, or deferral of tax liability. (see GAO, A Glossary of Terms Used in the Federal Budget Process, Exposure Draft, February 1993)

Tax Gap

An estimate of taxes (including duties) that are unpaid because of non-compliance with existing laws and regulations.

Treasury Warrant

An official document that the Secretary of the Treasury issues pursuant to law and that establishes the amount of monies authorized to be withdrawn from the central accounts that Treasury maintains. Warrants for currently unavailable special and trust fund receipts are issued when requirements for their availability have been met. (GAO, A Glossary of Terms Used in the Federal Budget Process, Exposure Draft, February 1993)

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

Trust Funds

Accounts that are designated by law as trust funds, for receipts earmarked for specific purposes and the associated expenditure of those receipts (OMB, Budget System and Concepts).

Trust Revolving Funds

Accounts that record permanent appropriation and expenditure of collections used to carry out a cycle of business type operations in accordance with a statute that designates the fund as a trust fund. (OMB Circular A-34)

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

INDEX OF TRANSACTIONS CLASSIFIED IN APPENDIX B

Acquisition of property, plant, and equipment (116)
Acquisition of property, plant, and equipment through exchange (135)
Appropriations (128)
Borrowing from the public (134)
Borrowing from Treasury, the Federal Financing Bank, or other Government accounts (134)
Cancellation of debt (122), (127)
Contribution by the general fund to the SMI trust fund (130)
Cost subsidies: difference between internal sales price (reimbursement) and full cost (128)
Cost Subsidies: difference between the service cost of pensions and employer entity contributions (129)
Customs Service fees (101)
Deposit fund transactions (140)
Deposits by states for unemployment trust fund (99)
Deposits of earnings, Federal Reserve System (102)
Disposition of revenue to other entities: custodial transfers (134)
Diversion fees, Department of Justice (112)
Donation of property, plant, and equipment: types that are expensed (137)
Donations: except types of property, plant, and equipment that are expensed (103)
Downward subsidy reestimates for direct loans and loan guarantees (137)
Employer entity contributions to health benefit plans for current coverage of Federal employees (123)
Employer entity contributions to retirement plans for Federal employees (123)
Employer entity contributions to social insurance programs (120)
Employer entity payments for unemployment benefits and workers compensation (124)
Federal employee contributions to health benefits plan for current coverage (113)
Federal employee contributions to retirement plans (112)
Fees on post-1991 direct loans and loan guarantees (138)
Fines and penalties (104)
Forfeitures (105)
Individual income taxes, corporation income taxes, social insurance taxes and contributions, excise taxes, estate and gift taxes,and customs duties (97)
Interchange between the Railroad Retirement Board and the Social Security and Hospital Insurance trust funds (131)
Interest (unless classified elsewhere) (108)
Interest on delinquent taxes and other receivables that arise as a result of custodial operations (111)
Interest on post-1991 direct loans (110)
Interest on Treasury securities held by revolving funds (124)
Interest on Treasury securities held by trust funds and special funds except trust revolving funds (119)
Interest on Treasury securities held by trust revolving funds

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

(125)
Interest on uninvested funds held by direct loan and guaranteed loan financing accounts (126)
Interest received by one fund from another (120)
Interest received by Treasury (126)
Intragovernmental sales of goods and services by a fund other than a revolving fund (122)
Intragovernmental sales of goods and services by a revolving fund (122)

Negative subsidies on direct loans and loan guarantees under credit reform (137)
Penalties due to delinquent taxes in connection with custodial activity (104)
Premiums for SMI (Supplementary Medical Insurance), bank deposit insurance, pension benefit guarantees, crop insurance, life insurance, and other insurance (112)
Proceeds from the auction of the radio spectrum (109)
Regulatory user fees such as patent and copyright fees; immigration and consular fees; SEC registration and filing fees; and Nuclear Regulatory Commission fees (111)
Reimbursement for cleanup costs (115)
Reimbursement for collecting revenue (114)
Rents, royalties, and bonuses on Outer Continental Shelf (OCS) (108)
Repayment of post-1991 direct loans (138)
Repayment of pre-1992 direct loans (138)
Repayment of receivables: except direct loans (139)
Retirement of debt securities prior to maturity (118)
Retirement of debt securities prior to maturity: revolving funds and trust revolving funds (127)
Retirement of debt securities prior to maturity: trust funds and special funds except trust revolving funds (121)
Revaluation of capitalized property, plant, and equipment (133)
Revaluation of inventory and related property (133)
Sales of different types of Government assets (135)
Sales of direct loans (117), (139)
Sales of foreclosed property associated with post-1991 direct loans and loan guarantees (140)
Sales of foreclosed property associated with pre-1992 direct loans and loan guarantees (117)
Sales of goods and services (107)
Sales of goods and services in undercover operations (107)
Sales of government property: other than property, plant, and equipment (115)
Sales of property, plant, and equipment: types that are capitalized (115)
Sales of receivables: except direct loans (117)
Seigniorage (118)
Social insurance taxes and contributions paid by Federal employees (99)
Transfer by CCC to Federal Crop Insurance Corporation (131)
Transfer of cash and other capitalized assets without

THE FEDERAL ACCOUNTING STANDARDS ADVISORY BOARD

Elmer B. Staats, Chairman

James L. Blum
Donald H. Chapin
Martin Ives
Norwood Jackson
Gerald Murphy
James E. Reid
Cornelius E. Tierney
Alvin Tucker

The Secretary of the Treasury, the Director of the Office of Management and Budget, and the Comptroller General established the Federal Accounting Standards Advisory Board (the FASAB or "the Board") in October 1990 to consider and recommend accounting principles for the United States Government.

The Board communicates its recommendations by publishing recommended accounting standards after considering the financial and budgetary information needs of Congress, executive branch agencies, and other users of federal financial information. The Board also considers comments from the public on its proposed recommendations, which are published for comment as "exposure drafts." The Board's sponsors, i.e., the officials who established the Board, then decide whether to adopt the recommendations. If they do, the standard is published by the OMB and the GAO and then becomes effective.

Additional background information is available from the FASAB, including: (1) the "Memorandum of Understanding among the General Accounting Office, the Department of the Treasury, and the Office of Management and Budget, on Federal Government Accounting Standards and a Federal Accounting Standards Advisory Board" and (2) the "Mission Statement of the Federal Accounting Standards Advisory Board."

Federal Accounting Standards Advisory Board
Ronald S. Young, Executive Director
750 First Street, NE, Room 1001
Washington, DC 20002
Telephone (202) 512-7350
Fax (202) 512-7366

[1]As explained in para. 44 of SFFAS Number 1, Accounting for Selected Assets and Liabilities, "more likely than not" means more than a 50 percent chance. "Not probable" means the converse, i.e., less than a 50 percent chance.

[2]Statement of Federal Financial Accounting Concepts No. 1, Objectives of Federal Financial Reporting.

standard is an exception to the general principle of SFFAS No. 5, Accounting for es of the Federal Government, which, but for this exception, would require a loss on a to be recognized at the time when expected costs exceeded expected revenue. However, the loss must be disclosed: see the disclosure requirement in paragraph 0 (d) below.

pricing guidance in OMB Circular No. A-25 does not apply to prices set by law or order.

[5]SFFAS No. 1, Accounting for Selected Assets and Liabilities, para. 41, states that "a receivable should be recognized . . . based on legal provisions, such as a payment due

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_7.pdf.

date (e.g., taxes not received by the date they are due) . . ." Under the revenue standard, past due taxes are not recognized on the date they are due, but rather on the date when tax returns are received without sufficient payment or legally enforceable claims against non-compliant taxpayers are established through enforcement processes.

[6] SFFAS No. 1, para. 44-51.

[7] For the recognition criteria for donated property, plant and equipment, see SFFAS No. 6, Accounting for Property, Plant, and Equipment, para. 30, 62, and 71.

accounting standards will determine the criteria for the imputation of costs and how sts shall be measured. This standard provides guidance for accounting for the ding financing source that is reported in such cases.

explained in the Basis for Conclusions, in the private sector, the term "net results of s" is synonymous with net income and net income is the "bottom line" measure of ce for profit-seeking businesses. For most Government reporting entities, on the other s is not the "bottom line" for performance measurement. See para. 0 and following.

e transfers are distinguished from custodial transfers in that transfers involve assets e been earned or in use by the entity in carrying out its programs whereas custodial involve funds that have been collected on behalf of another entity. Accounting for transfers is described in the section covering nonexchange revenue.

information on funds is reported separately and the basis of accounting is not in e with applicable accounting standards, the report should state that it is prepared on of legal requirements.

category includes representational organizations, retired federal employees, federal responding as individuals, and federal contractors, as well as academics and other

revolving funds that are self-financing do not recover full cost from their customers if not charged for all of their own costs, such as pension and retirement health benefits employees.

C No. 1, Objectives of Federal Financial Reporting, p. 39, paragraphs 126 and 128.

ods of calculating depletion based on the economic cost of extraction, such as ed here, should be distinguished from depletion methods allowed under the Internal ode.

ular No. A-25, *User Charges*, as revised July 8, 1993, establishes Federal policy fees assessed for government services and for the sale or use of government goods or . It implements the provisions of Title V of the Independent Offices Appropriations Act 31 U.S.C. 9701), which generally calls for "each service or thing of value provided by . . . to a person . . . to be self-sustaining to the extent possible" and says that hall be based on a number of specified criteria including "the costs to the Government." dance of Circular A-25 also applies to the assessment of user charges under other However, Circular A-25 is intended to be applied only to the extent permitted by law or order; it does not apply to the legislative and judicial branches or to mixed-ownership t corporations; and its requirements are deemed to be met by other OMB circulars that uidance concerning a specific user charge area.

if all taxpayers filed returns, the underlying event criteria for most taxpayers is come for the calendar year, whereas the government's fiscal year ends September 30. required estimated tax payments do not eliminate the problem of measuring taxes based rtificial" nine months period ending September 30 for calendar year taxpayers whose r the following three month "stub" period ending December 31 could be disproportionate.

uant to law, Customs establishes legal assessments for fines in amounts which frequently y exceed the value of the goods, then subsequently abates the fine to a fraction of that lso in accordance with applicable law. Full disclosure and explanation of practice d better understanding of the significance of assessments, abatements, and uncollectible

This is the final approved Statement of Federal Financial Accounting Standards (SFFAS) 8, Supplementary Stewardship Reporting.

****
****
FASAB -- Federal Accounting Standards Advisory Board
****

Supplementary Stewardship Reporting, Statement of Federal Financial Accounting Standards 8

****
****
[From Inside Front Cover]

THE FEDERAL ACCOUNTING STANDARDS ADVISORY BOARD (FASAB)

The Federal Accounting Standards Advisory Board (FASAB or "the Board") was established in October 1990 by the Secretary of the Treasury, the Director of the Office of Management and Budget (OMB), and the Comptroller General. The nine-member Board was created to consider and recommend accounting principles for the Federal Government.

The Board communicates its recommendations by publishing recommended accounting standards after considering the financial and budgetary information needs of congressional oversight groups, executive agencies, and other users of Federal financial information. The Board also considers comments from the public on its proposed recommendations, which are published for comments as "exposure drafts." The Board's sponsors then decide whether to adopt the recommendations. If they do, the standard is published by OMB and GAO and then becomes effective.

The following documents related to the establishment and mission of the Board are available from the FASAB:

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

-- "Memorandum of Understanding among the General Accounting Office, the Department of the Treasury, and the Office of Management and Budget, on Federal Government Accounting Standards and a Federal Accounting Standards Advisory Board"

-- "Mission Statement: Federal Accounting Standards Advisory Board"

****

a The purpose of this Statement is to establish standards for reporting on the Federal Government's stewardship over 1) certain resources entrusted to it, identified as stewardship property, plant, and equipment and stewardship investments, and 2) certain responsibilities assumed by it, identified as the current service assessment. The resources and responsibilities do not meet the criteria for assets and liabilities that are required to be reported in the financial statements but are, nonetheless, important to an understanding of the operations and financial condition of the Federal Government at the date of the financial statements and in subsequent periods. Because the Government has been entrusted with, and made accountable for, these resources and responsibilities, they should be recognized in the financial reports of the Federal Government and of its component entities. This determination was made to more fully satisfy the stewardship objective defined in the concepts statement, Objectives of Federal Financial Reporting.[FN1-Objectives of Federal Financial Reporting, SFFAC No. 1, September 1993.]

b The stewardship objective requires that the Federal Government "report on the broad outcomes of its actions." Such reporting will provide information that could help report users assess the impact of the Government's operations and activities for the period on its financial condition.[FN2-Ibid., pp. 41-42.]

c Stewardship resources involve substantial investment by the Federal Government for the benefit of the Nation. When made, they are treated as expenses in the financial statements. These expenses, however, are intended to provide long-term benefits to the public. Therefore, this Statement requires that information on these resources be reported to highlight their long-term-benefit nature and to demonstrate accountability over them. Depending on the nature of the resources, stewardship reporting could consist of financial and nonfinancial data.

d This Statement also establishes a standard for reporting

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

projections that will aid in assessing the sufficiency of future budgetary resources to sustain public services and meet obligations as they come due.

e Given the above purpose, this Statement establishes standards for supplementary stewardship reporting that are on the basis of categories defined in the paragraphs that follow.

f Stewardship Property, Plant, and Equipment (PP&E) - property owned by the Federal Government and meeting the definition of one of the following three categories:

-- Heritage Assets - property, plant, and equipment of historical, natural, cultural, educational, or artistic significance.

-- Federal Mission PP&E - property, plant, and equipment integral to certain unique Federal missions.

-- Stewardship Land - land other than that acquired for or in connection with general PP&E.

g Stewardship Investments - items treated as expenses in calculating net cost but meriting special treatment to highlight their substantial investment and long-term-benefit nature. This includes:

-- Nonfederal Physical Property - grants provided for properties financed by the Federal Government, but owned by the state and local governments.

-- Costs incurred for education and training programs that are designed to increase or maintain national economic productive capacity and research efforts to provide future benefits or returns. These include:

- Human Capital - education and training programs financed by the Federal Government for the benefit of the public.

- Research and Development - basic and

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

applied
research and development.

h Stewardship Responsibilities - the projected financial impact on the Government of sustaining current services that it provides. Projections of current services provided by the Government aid in assessing the sufficiency of future budgetary resources to sustain public services and meet obligations as they come due. This assessment, termed a Current Services Assessment, provides receipt and outlay data on the basis of projections of future activities.

j All stewardship information is deemed "required supplemental
stewardship information" (RSSI). Audit requirements for RSSI will be established in a collaborative effort by the Office of Management and Budget (OMB) and the General Accounting Office (GAO).

k The introduction and background chapter of this standard provides information on the approaches used to develop the standards for supplementary stewardship reporting. Appendices include a basis for the Board's conclusions, sample stewardship reports, and a glossary of terms used in the Statement. First-time use of glossary terms within the body of this document appear in boldface.

Purpose

1 The purpose of this Statement is to establish standards for reporting on the Federal Government's stewardship over certain resources entrusted to it, and certain responsibilities assumed by it. The resources and responsibilities relate to those which do not meet the criteria for assets and liabilities that are required to be reported in the financial statements but that are important to an understanding of the operations and financial condition of the Federal Government at the date of the financial statements and in subsequent periods. Costs of these stewardship-type resources are treated as expenses in the financial statements in the year the costs are incurred. However, these costs and resultant resources are intended to provide long-term benefits to the public and are included in stewardship reporting to highlight for the reader their long-term-benefit nature and to demonstrate accountability over them.

2 Specific descriptions of these stewardship-type resources are addressed later in this chapter and in the individual standards (chapters 2-7) in this Statement. Generally, stewardship reporting on these resources includes:

-- Information on investment in physical capital other
than that used to support Federal operations to provide goods and services to the public, that is, investment in other than general property, plant, and equipment (PP&E)[FN3-Physical assets supporting Federal operations to provide goods and services to the public, referred to as general property, plant and equipment (PP&E), are addressed in Accounting for Property, Plant and Equipment, SFFAS No. 6.].

-- Information on investment in other than physical capital. Such information, as well as the information called for in the paragraph above, will be reported for stewardship purposes on an investment basis (that is, as benefitting more than the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

current reporting period) rather than a consumption basis (that is, as benefitting only the current reporting period). Such a presentation could help users analyze all Federal investment on an equal basis, and make decisions among competing investments, such as when allocating Federal resources or deciding whether to authorize new programs or modify ongoing programs.

-- Information that could assist in measuring the success of certain programs. The measurement of the benefits received for the dollars invested and the evaluation of program performance could appear with other stewardship information as part of the financial statements, or in other financial reports, for example, in a report on program performance.

3 This Statement also establishes standards for providing information on stewardship responsibilities (chapter 8) through projections for the Government as a whole. The projections will aid in assessing the Government's financial condition and the sufficiency of future budgetary resources to sustain public services and meet obligations as they come due.

4 Each standard is summarized briefly in a box followed by a detailed explanation of the standard. However, the standards comprise the summaries in the boxes and the entire text of the explanations.

Background and Rationale

5 The Concepts Statement, Objectives of Federal Financial Reporting was developed on the basis of an in-depth assessment of user needs and is used to guide the Board in developing Federal accounting and reporting standards. The objectives cover four areas: budgetary integrity, operating performance, stewardship, and systems and control.

6 This Statement of accounting standards addresses the objective of reporting on stewardship over certain resources entrusted to the Federal Government and responsibilities assumed by it. The need for a report on the Federal Government's stewardship over the resources entrusted to it and the responsibilities it has assumed, arises because of the unique nature of the Federal Government, as described in the following section.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

Stewardship and the Reporting Objectives

7 "Financial position" is a representation of an entity's economic resources and the claims on those resources as of a particular date. In the private sector, the principal objective of reporting on financial position is to assess the viability of the entity, the business firm, and its potential profitability.

8 Assessing the overall performance of the Federal Government is not exclusively a matter of comparing revenue and expense, or its accumulated assets and liabilities.

9 The Federal Government's viability and perpetuity are assumed. It has unique access to financial resources and financing, and the power to tax, to borrow, and to create money. For the Federal Government, financial performance is a vital issue, but traditional financial measures provide data that are appropriate for assessing only some, not all, of the responsibilities for which the Government should be held accountable. Since it exists not to make a profit but to serve the needs of the citizens and to promote the general welfare of the Nation, other measures of accountability need to be used. Measures of accountability are to be reported for elements that are defined as stewardship property, plant, and equipment (PP&E); stewardship investments; and stewardship responsibilities. These elements of stewardship exist because the Federal Government is dissimilar to industrial and commercial entities.

Financial Condition

10 The measures of accountability mentioned above help to portray the Government's "financial condition." Financial condition is a broader and more forward-looking concept than is financial position. Financial condition allows an assessment of an entity on the basis of additional data that could include financial and nonfinancial information about current conditions. These additional data provide a more complete indication of performance. In some cases, it may be necessary to present and characterize financial data in ways that differ from traditional financial reporting and to supplement traditional data with nonfinancial data. In other cases, it may be necessary to rely almost entirely on nonfinancial data to provide a more complete

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

presentation of entity performance. Moreover, assessment of financial condition could include analysis of trends, demands, commitments, events, and uncertainties.[FN4-Chapter 7 of the Objectives of Federal Financial Reporting provides a full discussion of financial position and financial condition.]

Stewardship PP&E

11 "Stewardship PP&E" consists of items whose physical properties resemble those of general PP&E traditionally capitalized in financial statements. However, the nature of these Federal physical assets that are classified as stewardship PP&E differ from general PP&E in that their values may be indeterminable or may have little meaning (for example, museum collections, monuments, assets acquired in the formation of the nation) or that allocating the cost of such assets (for example, military weapons systems and space exploration hardware) to accounting periods that benefit from the ownership of such assets is meaningless. However, the Federal Government should be able to demonstrate accountability for stewardship PP&E by reporting on its existence and on its condition by a reference to deferred maintenance reported in the financial statements. Stewardship PP&E would include stewardship land (that is, land not acquired for or in connection with general property, plant, and equipment); heritage assets (for example, Federal monuments and memorials and historically or culturally significant property); and Federal mission property, plant, and equipment (for example, space exploration and military weapons systems).

Stewardship
Investments

12 "Stewardship investments" are substantial investments made by the Federal Government for the benefit of the nation. When incurred, they are treated as expenses in determining the net costs of operations. However, these items merit special treatment so that readers of Government financial reports know the extent of these investments that are made for long-term benefit. Such investments will be measured in terms of expenses incurred for certain education and training programs; federally financed research and development; and federally financed but not federally owned property, such as bridges and roads.

13 Because the Government has been entrusted with and made accountable for these resources, they should be reported in the financial reports of the Government and of its component

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

entities. This will help satisfy the stewardship objective defined in the concepts statement, Objectives of Federal Financial Reporting, SFFAC No. 1. The goal of the stewardship objective is that the Federal Government "report on the broad outcomes of its actions." Such reporting may provide information that could help report users assess the impact of the Government's operations and investments for the period.[FN5-See SFFAC No. 1, pp. 41-42.]

Stewardship Responsibilities

14 A key aspect of the stewardship objective requires that Federal reporting provide information that helps users determine (1) whether the Government's financial condition improved or deteriorated over the period and (2) whether future budgetary resources will likely be sufficient to sustain public services and to meet obligations as they come due.[FN6-Ibid., pp. 42-44.]

15 Information on "stewardship responsibilities" will aid in these determinations. It will provide an essential perspective on the Government's commitment to discretionary and mandatory programs.

16 Reporting on this stewardship responsibility may be accomplished in a stewardship section in the consolidated financial report of the Federal Government.

Stewardship Categories or Elements

17 In defining the specific categories of items, or elements, that would appear as stewardship information, the Board decided on the following:

-- Property owned by the Federal Government and meeting the definition of one of the following three categories:

- Property, plant, and equipment of historical, natural, cultural, educational or artistic significance, referred to as heritage assets, for example, the Washington Monument and the Lincoln Memorial;

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

- Property, plant, and equipment that are integral to meeting a unique Federal mission, referred to as Federal mission[FN7-The term "Federal mission" refers to activities that are typically Federal, such as National defense. In addition, Federal mission PP&E is limited to PP&E that would not typically be used by non-federal entities. Clearly, any functions performed by a Federal entity could be broadly labeled "Federal mission." The definition of this category, however, clarifies the characteristics of PP&E appropriately included in this category--a much narrower group than inferred by the category's title.] property, plant, and equipment (PP&E), and

- Investments in stewardship land,[FN8-The Board is including only surface land as supplementary stewardship information because the issues associated with other than surface land, i.e., the natural resources on and under that land, are complex. The Board is researching these complex issues and will publish a separate exposure draft on a proposed accounting standard for natural resources at a later date.] that is, land not acquired for or in connection with general property, plant, and equipment, for example, national forests, parks, and historic sites. Some investments in stewardship land, for example national parks, will be reported by both 1) the number of acres used as a park or an historic site in the stewardship land category, and 2) by the number of physical units identified as national parks in the heritage assets category. Such reporting would not be considered duplication, as the type of information reported on an item would be different for each category of stewardship asset.

-- Properties financed by the Federal Government but owned by state and local governments, referred to as nonfederal physical property, for example, highways and bridges.

-- Expenses that are incurred for education and training that are intended to increase national economic productive capacity or for research and development that are intended to provide future benefits or returns. This includes:

- Investments in human capital, that is, education and training programs provided by the Federal Government, for example, job training programs, and grants for higher education.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

- Investments in research and development, for example, research on the effects of early medical intervention in delaying the onset of AIDs symptoms in HIV-positive individuals, and Federal investment in genetic code research to advance national medical research.

-- Information on the projected financial impact on the Government of providing current services, assuming a continuation of current programs. This information will be in the form of a current services assessment providing future receipt and outlay data on the basis of projections of future activities for the Government as a whole and will include both discretionary and mandatory programs and interest on debt.

18 The previous categories of items or elements result from or exist largely because of the Federal Government's role as a sovereign power. The components that they include are defined and discussed in detail in their respective chapters of this standard.

The Nature of Stewardship Reporting

19 The Board, recognizing the Federal Government's size, complexity, diversity, and impact on others, has determined that the aforementioned information is needed in addition to that included in financial statements.

20 Such information may not link directly with the basic financial statements because the data to be reported may be other than financial, for example, physical units or projections. It will supplement the basic financial statements.

21 This information, as indicated in each of the standards, will be designated as required supplementary stewardship information (RSSI) for the consolidated financial statements of the Federal Government and of the entities who have stewardship responsibilities over resources identified earlier in this document. The Board has chosen to call this RSSI to distinguish it from "required supplementary information" (RSI), for which audit responsibilities are prescribed in existing professional literature. The Board believes that OMB and GAO should establish and cause the implementation of the audit responsibilities for

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

RSSI.

Stewardship Information

22 Stewardship information may be presented in varying formats depending on the nature of the Federal investments or claims to Federal resources controlled by an entity. Such information is required for those entities (1) that control stewardship resources and (2) whose financial statements purport to be in accordance with Federal accounting principles as recommended by FASAB, and approved by the Secretary of the Treasury, the Director of OMB and the Comptroller General.

23 Examples of selected portions of stewardship report sections
are included at Appendix B.

Measurement

24 The separate standards for each stewardship element contain specific guidance for that element. In general, however, stewardship investments shall be measured on the same basis of accounting as used for financial statements, including appropriate accrual adjustments, general and administrative overhead, and a share of the cost of facilities (for example, depreciation).[FN9-See Managerial Cost Accounting Standards for the Federal Government, SFFAS No. 4, for a discussion of Federal cost accounting principles and standards.]

25 For investments that are intended to maintain or increase the economic productive capacity of the Nation, that is, investments in human capital, research and development, and nonfederal physical property, trend data shall be presented. Trend data should reflect the full cost (including allocation of facility and administrative costs) of the investment.

26 For stewardship land and heritage assets, measurement will be done on other than a financial basis. For example, measurement may be on the basis of physical units, such as acres of land. Specific data requirements are addressed in the individual stewardship standards.

27 Generally, amounts shall be reported in nominal dollars. If trend data that span many years are reported and the entity

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

believes that constant dollar information would be meaningful for data interpretation, constant dollar data may be provided in addition to nominal dollar data.

28 Split Grants. Frequently, stewardship elements are financed by grants. In some cases, the grants may have more than one purpose.[FN10-An example of a grant with a split purpose is a grant issued to a teaching hospital to perform both medical education and medical research.] For such grants, the investment shall be allocated among stewardship elements on the basis of an estimate of the proportionate funding of the various grant objectives. If allocation is not feasible, the investment shall be reported on the basis of the predominant use of the grant.

29 Performance Indicators. For some stewardship elements, categorization of these elements as investments is predicated on producing outputs and outcomes. The specific procedures, including a phasing-in process for requiring such justification, is contained in the individual respective standards.

30 Reporting Program Expenses. Trend data reported on stewardship investment elements should reflect the full cost[FN11-See Managerial Cost Accounting Standards for the Federal Government, SFFAS No. 4, for a discussion of Federal cost accounting principles and standards.] of the investment for the year being reported upon and the preceding 4 years. Additional years' data also may be reported if such data would better indicate the investment nature of an item.

31 In some cases, before the issuance of Federal accounting standards, entities have maintained records on the basis of outlays rather than expenses. It may be impracticable for such entities to reconstruct their accounts on the basis of expense. In such cases, entities may report data on an outlay basis for any years for which expense data are not available. At the end of 5 years, entities should have sufficient expense data to be able to report expenses rather than outlays.

32 Reporting Deferred Maintenance. Many state and local governments, members of Congressional oversight committees, and national groups, have raised the issue of the deteriorating condition of federally-owned PP&E because of deferred maintenance associated with these assets. The issue was addressed in association with PP&E. As a result, a deferred maintenance standard in Accounting for Property, Plant, and Equipment, SFFAS No. 6, establishes reporting requirements related to the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

condition and future maintenance requirements for PP&E.

33 These requirements are flexible since different conditions may be considered acceptable by different entities, as well as for different items of PP&E held by the same entity. The deferred maintenance standard is applicable to all PP&E whether the PP&E is reported as general PP&E or stewardship PP&E.

Reporting Requirements

34 Within each of the standards, minimum required and, in some cases, recommended reporting is described. These requirements and recommendations, including a phasing-in process for entities who may not have required data available at the implementation of the standards, are contained in the individual standards. These requirements describe the nature of items to be reported by Federal entities; guidance on the form and content of agency financial reports, including the specific guidance on the format in which items addressed in this Statement will be reported, will be prescribed by OMB.

35 Reporting should be at the major program or category level; individual transactions need not be reported unless significant. Additional reporting is encouraged when preparers believe such information would make the financial report more meaningful or understandable.

Social Insurance

36 The Board first considered accounting and reporting for social insurance programs while considering SFFAS No. 5, Accounting for Liabilities of the Federal Government. The Board concluded, at that time, that the topic should be made part of the Supplementary Stewardship Reporting project.

37 Research and deliberations regarding social insurance have continued as part of the Supplementary Stewardship Reporting project. However, the Board, recognizing the magnitude and complexity of these programs, the strength of the views on the accounting and reporting issues, the significant attention being focused on these programs at the present time, and the potential for change to the programs, has again concluded that additional consideration is appropriate before issuing final guidance. Accordingly, the Board has not included guidance on social

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

insurance in this Statement and has added a Social Insurance Accounting project to its agenda.

Applicability

38 This standard requires that the consolidated financial reports[FN12-The terms "financial statements" and "consolidated financial statements" are used throughout this document to refer to the basic financial statements of a reporting entity; the basic financial statements normally include: the balance sheet, the statements of net cost, changes in financial position, financing, budgetary resources, and custodial activities and the notes to the financial statements. The terms "financial reports" and "consolidated financial reports" are used to refer to a document which would include the financial statements but which would also include items such as: a management discussion and analysis section, a statement of program performance measures, required supplemental information or required supplementary stewardship information not included in the financial statements or other supplemental financial and management information.] of the Federal Government and the financial reports12 of its component units contain RSSI relating to:

-- amounts invested in human capital, research and development, and nonfederal physical property; and

-- quantities (stated in terms of physical units or dollars) of land, heritage assets, and Federal mission property.

Although FASAB's sponsors do not set accounting standards for the legislative or judicial branches, Federal accounting standards would be appropriate for them.

39 Because the financial reports of the Federal Government present the aggregation of information about stewardship investments and assets related to varied agencies and programs, further deliberations by the Board are needed to reach a decision on the amount and nature of information to be required under this standard for reporting in the consolidated financial report. Accordingly, except for the standard described in Chapter 8, "Current Service Assessment," the effective date of the stewardship standards as they apply to the consolidated financial report, is deferred pending that decision. The effective date of the standard in Chapter 8 is for fiscal periods beginning after

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

September 30, 1997. In the interim, the consolidated financial reports should include such summary or selected information as is feasible. Experimentation is encouraged, as is the reporting of such additional information as will enhance the financial report.

40 Some Federal entities, including those government corporations listed in the Government Corporation Control Act and certain others, such as the US Postal Service, are required by law or policy to publish financial statements pursuant to the standards issued by the Financial Accounting Standards Board (FASB). (Some entities also may be required to prepare statements pursuant to standards set by a regulatory agency. That practice would not be affected by this statement of standards.) For such entities, this standard provides the following general principles:

-- Applying Applicable Accounting Principles - Separately issued (stand-alone) general-purpose financial statements on such entities should apply applicable accounting principles that will best meet user needs and comply with any relevant statutory requirements. This principle would continue to be true for separately issued statements even if, pursuant to the provisions below, other information about these entities might need to be presented when their financial statements are included within reports of a larger Federal entity.

-- Reporting Additional or Supplementary Information - When financial information on such entities is included in general-purpose financial reports of a larger Federal reporting entity (including Treasury's consolidated financial report), any applicable standards recommended by the FASAB and issued by OMB and the General Accounting Office (GAO) that call for additional reporting or supplementary information should be applied.

-- Applying Applicable Standards When Differences Arise - When financial information on such entities is included in general purpose financial reports of a larger Federal reporting entity (including Treasury's consolidated financial report), standards recommended by FASAB and issued by OMB and GAO should be used if the difference arising from differences between Federal accounting standards and FASB's would be material to users of the report of the larger entity.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

Materiality

41 The provision of this Statement need not be applied to immaterial items. The determination of whether an item is material depends on the degree to which omitting or misstating information about the item makes it probable that the judgement of a reasonable person relying on the information would have been changed or influenced by the omission or the misstatement.

Effective Date

42 The accounting standards in this statement, except for the standards described in Chapters 2-7 to the extent that they relate to the consolidated financial report of the Federal Government, are effective for fiscal periods beginning after September 30, 1997. Earlier implementation is encouraged. See paragraph 39 for the effective date of standards in Chapters 2-7 relating to the consolidated financial report.

****

CHAPTER 2: STANDARD - HERITAGE ASSETS

****

Heritage Assets - Heritage assets shall be reported as required supplementary stewardship information accompanying the financial statements of the Federal Government and the component units of the Federal Government responsible for such assets. Heritage assets shall be reported in terms of physical units rather than cost, fair value, or other monetary values.

Definition

43 "Heritage assets" are PP&E that are unique for one or more of the following reasons:

-- historical or natural significance;

-- cultural, educational or artistic (for example, aesthetic) importance; or

-- significant architectural characteristics.

44 Heritage assets are generally expected to be preserved indefinitely. One example of evidence that a particular asset is heritage in nature is that it is listed on the National Register of Historic Places.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

45 Some investments in heritage assets, for example national parks, will be reported by both 1) the number of physical units identified as national parks in the heritage assets category, and by 2) the number of acres used as a park or an historic site in the stewardship land category (see Chapter 4 of this document). Such reporting would not be considered duplication, as the type of information reported on an item would be different for each category of stewardship asset.

Measurement

46 Heritage assets shall be quantified in terms of physical units (for example, number of items in collections or the number of national parks). No asset amount shall be shown on the balance sheet of the Federal financial statements for heritage assets.

47 The costs of acquiring, constructing, improving, reconstructing, or renovating heritage assets shall be considered an expense in the period incurred when determining the net cost of operations.[FN13-For guidance in measuring and reporting the cost of heritage assets transferred from other federal entities, and heritage assets acquired through donation or devise, see the general PP&E standard contained in Accounting for Property, Plant, and Equipment SFFAS No. 6.] The cost shall include all costs incurred to bring the heritage asset to its current condition and location.

Multi-use Heritage Assets

48 Not all heritage assets are used solely for heritage purposes--some serve two purposes by providing reminders of our heritage and by being used in day-to-day government operations unrelated to the assets themselves. The cost of renovating, improving, or reconstructing operating components of heritage assets used in Government operations shall be included in general PP&E. The renovation, improvement, or reconstruction costs to facilitate Government operations (for example, installation of communication wiring or redesign of office space) would be capitalized and depreciated over its expected useful life. The cost should not be depreciated over an unrealistically long life.

49 Costs of renovating or reconstructing the heritage asset that cannot be associated directly with operations shall be considered heritage asset costs and included as expense in

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

calculating net costs.

Minimum
Reporting

50 The determination of the most relevant information to be presented should be made by the preparer; however, reporting at the entity level shall be more specific than at the governmentwide level. The following are examples of information that should be considered for presentation:

-- Description of each major category of heritage asset.

-- The number of physical units added and withdrawn from the heritage asset records during the year and the end-of-year number of physical units for each type of heritage asset. Heritage assets consist of (1) collection-type heritage assets, such as objects gathered and maintained for exhibition, for example, museum collections, art collections, and library collections; and (2) noncollection-type heritage assets, such as, parks, memorials, monuments, and buildings.

-- Description of the methods of acquisition and withdrawal of heritage assets.

-- Condition[FN14-Examples of condition information include, among others, (1) averages of standardized condition rating codes; (2) percentage of assets above, at, or below acceptable condition; or (3) narrative information.] of the assets unless it is already reported in a note to the financial statements in which case a reference to the note will suffice.

-- A reference to a note to the financial statements if deferred maintenance is reported for the assets.FN15-For guidance relating to deferred maintenance reporting, see the Deferred Maintenance standard in Accounting for Property, Plant, and Equipment SFFAS No. 6.]

Implementation
Guidance

51 For guidance on heritage assets that were previously recognized as assets for balance sheet reporting, see Statement

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

of Federal Financial Accounting Standards (SFFAS) No. 6, Accounting for Property, Plant and Equipment, page 18, paragraphs 63, 64, and 65.

****

CHAPTER 3: STANDARD - FEDERAL MISSION PROPERTY, PLANT, AND EQUIPMENT

****

Federal Mission Property, Plant, and Equipment - Federal mission property, plant, and equipment (PP&E) shall be reported as required supplementary stewardship information accompanying the financial statements of the Federal Government and the component units of the Federal Government responsible for such PP&E. Federal mission PP&E shall be valued and reported using either the total cost or the latest acquisition cost valuation method.

Definition

52 Federal mission PP&E includes items used to meet a Federal Government mission in which the specific PP&E used is an integral part of the output of the mission.[FN16-The name "Federal mission PP&E" may cause readers to erroneously assume that this category should include any PP&E supporting a Federal mission. Federal mission PP&E is limited to those items specifically identified herein as well as any other items exhibiting at least one characteristic from each of the two groups listed.] PP&E should be considered Federal mission PP&E if it possesses at least one of each of the two types of characteristics presented below. One type of characteristic relates to the use of Federal mission PP&E, and the other relates to its useful life.

53 Characteristics related to the use of the Federal mission PP&E are that it

-- has no expected nongovernmental alternative uses; or

-- is held for use in the event of emergency, war or natural disaster; or

-- is specifically designed for use in a program for which there is no other program or entity (Federal or nonfederal) using similar PP&E with which to compare costs.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

54 Characteristics related to the useful life are that it

-- has an indeterminate or an unpredictable useful life[FN17-This may be evidenced by the ability (1) to retire the PP&E and later return it to service or (2) to continually upgrade the PP&E to maintain its usefulness.] because of the unusual manner in which it is used, improved, retired, modified or maintained, or

-- is at a very high risk of being destroyed during use or
of premature obsolescence.

55 Federal mission PP&E excludes land whether the land is general PP&E land or stewardship land.

56 Federal mission PP&E, however, specifically includes (1) weapons systems PP&E (for example, fighter or attack aircraft, submarines, and tracked combat vehicles) and (2) space exploration equipment (for example, space hardware and launch, tracking, and recovery facilities). Weapons systems and space exploration equipment are defined in the following paragraphs.

57 Weapons Systems. Weapons systems are a combination of one or more weapons[FN18-Weapons are instruments of combat used to destroy, injure, defeat or threaten an enemy. (adapted from Dictionary of Weapons and Military Terms)] with all related equipment, materials, services, personnel, and means of delivery and deployment required for self-sufficiency.[FN19-Joint Chiefs of Staff, Department of Defense Dictionary of Military and Associated Terms, Joint Publication 1-02, March 23, 1994.] This standard addresses only the PP&E component of weapons systems. PP&E included in weapons systems are distinguished from general property, plant, and equipment held by defense agencies and defense support agencies in that they are intended to be used directly by the armed forces to carry out combat missions, when necessary, and to train in peacetime.

58 Weapons systems include only those assets owned by defense agencies and defense support agencies that would otherwise meet the property, plant, and equipment definition. Items meeting other than the PP&E asset category definitions are excluded from Federal mission PP&E, such as items of inventory or operating materials and supplies.

59 Space Exploration Equipment. Space exploration equipment

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

includes

-- items that are intended to operate above the atmosphere for space exploration purposes, and

-- any specially designed equipment to aid, service, or operate other equipment engaged in exploring space.

Measurement

60 Federal mission PP&E shall be valued using either the total cost or the latest acquisition cost valuation method.

61 There is a presumption that the valuation method previously used by the entity was appropriate for the circumstances and, therefore, should be applied on a consistent basis. Accordingly, the preparer shall justify any changes in the use of a valuation method.

62 For purposes of this standard, the "total cost method" is defined to include the actual acquisition cost of each item held plus the costs of any additions, improvements, alterations, rehabilitations, or replacements that extend the useful life of the Federal mission PP&E.

63 Under the latest acquisition cost method, all like units that are held are valued at the invoice price of the most recent like item purchased, less any discounts, plus additional costs described in the following paragraphs.

64 Using either cost valuation method, the cost assigned to an item of PP&E shall include all costs incurred to bring the Federal mission PP&E to a form and location suitable for its intended use. For example, the cost of acquiring Federal mission PP&E may include

-- amounts paid to vendors;

-- transportation charges to the point of initial use;

-- handling and storage costs;

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

-- labor and other direct or indirect production costs (for assets produced or constructed);

-- engineering, architectural, and other outside services for designs, plans, specifications, and surveys;

-- acquisition and preparation costs of buildings and other facilities;

-- an appropriate share of the cost of the equipment and the facilities used in construction work;

-- fixed equipment and related installation costs required for activities in a building or a facility;

-- direct costs of inspection, supervision, and administration of construction contracts and construction work;

-- legal and recording fees and damage claims;

-- fair value of facilities and equipment donated to the government; and

-- material amounts of interest costs paid.[FN20-"Interest costs" include any reimbursable interest paid by the reporting entity directly to providers of goods or services related to the acquisition or construction of Federal mission PP&E. It excludes any interest costs paid by a reporting entity in financing its own debt.]

65 No asset amount shall be shown on the balance sheet for Federal mission PP&E.

66 The acquisition cost of Federal mission PP&E shall be considered an expense in determining the net costs of operations in the period acquired. The cost of constructing, improving, reconstructing, or renovating Federal mission PP&E also shall be considered an expense in determining net costs in the period incurred.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

67 For acquisitions of Federal mission PP&E where costs are incurred over a number of years, the portion of the cost incurred during the reporting period shall be considered an expense in the period incurred in determining the net cost of operations and the total cost to date considered an acquisition-in-process cost in the required supplementary stewardship information.

Minimum Reporting

68 Federal Mission PP&E shall be reported as required supplementary stewardship information. Reporting at the entity level for Federal mission PP&E shall be more specific than at the governmentwide level. At a minimum, the following information shall be reported:

-- A description of major types of Federal mission PP&E by the holding entity and the values assigned under the valuation method used.

-- The value of Federal mission PP&E added and withdrawn during the year, the increase or the decrease in value resulting from revaluations of assets held to latest acquisition cost, and the end-of-year value for each major type of property using the entity's valuation method.

-- A description of the methods of acquisition and withdrawal of Federal mission PP&E. This should be reported at the major program or category level; individual transactions, unless significant, need not be reported.

-- Condition[FN21-Examples of condition information include, among others, (1) averages of standardized condition rating codes; (2) percentage of assets above, at, or below acceptable condition; or (3) narrative information.] of the assets unless it is already reported in a note to the financial statements in which case a reference to the note will suffice.

-- A reference to the applicable note to the financial statements if deferred maintenance is reported for the assets.

Implementation Guidance

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

69 For guidance on Federal mission PP&E previously recognized as assets for balance sheet reporting, see SFFAS No. 6, Accounting for Property, Plant, and Equipment, page 16, paragraphs 55 and 56.

70 For guidance on deferred maintenance reporting, see SFFAS No. 6, Accounting for Property, Plant, and Equipment, page 23, paragraphs 77 through 84.

****

CHAPTER 4: STANDARD - STEWARDSHIP LAND

****

Stewardship Land - Land not acquired for or in connection with[FN22-"Acquired for or in connection with" is defined as including land acquired with the intent to construct general PP&E and land acquired in combination with general PP&E, including not only land used as the foundation, but also adjacent land considered to be the general PP&E's common grounds.] items of general PP&E, that is, stewardship land, shall be reported as required supplementary stewardship information accompanying the financial statements of the Federal Government and the separate reports of component units of the Federal Government responsible for such land. Stewardship land shall be reported in terms of physical units rather than cost, fair value, or other monetary values.

Definition

71 "Land" is defined as the solid part of the surface of the earth. Excluded from the definition are the natural resources (that is, depletable resources, such as mineral deposits and petroleum; renewable resources, such as timber; and the outer-continental shelf resources) related to land.

72 Although the Federal Government holds vast amounts of "proven" and "inferred" natural resources, the major reasons for addressing only surface land in this project were (1) the allotted time frame within which to complete this standard; (2) existing studies that point out the difficulties and the complexities of accurately estimating and valuing natural resources; and (3) disputes regarding the boundaries of the outer-continental shelf.[FN23-The Board presently has an active project to address standards for natural resources.]

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

73 Land and land rights[FN24-"Land rights" are interests and privileges held by the entity in land owned by others, such as leaseholds, easements, water and water power rights, diversion rights, submersion rights, rights-of-way, mineral rights, and other like interests in land.] owned by the Federal Government and acquired for or in connection with items of general PP&E shall be accounted for and reported as general PP&E.

74 Land and land rights owned by the Federal Government and not acquired for or in connection with items of general PP&E will be reported as stewardship land. Examples of stewardship land include land used as forests and parks, and land used for wildlife and grazing.

Measurement

75 Stewardship land shall be quantified in terms of physical units (for example, acres) rather than in monetary terms.

76 No asset amount shall be shown on the balance sheet of the Federal financial statements for stewardship land.

77 The acquisition cost of stewardship land shall be considered an expense in the period acquired when determining the net cost of operations.

78 In some cases, land may be acquired along with existing structures. The following treatments may apply:

-- if the structure, which would be deemed a heritage asset, is significant in and of itself, the entity shall use its judgement as to whether the acquisition cost shall be treated as the cost of stewardship land, heritage asset, or both;

-- if the structure is to be used in operations (for example, as general PP&E) but 1) the value of the structure is insignificant, or 2) its acquisition is merely a byproduct of the acquisition of the land, the cost in its entirety shall be treated as an acquisition of stewardship land; or

-- only significant structures that have an operating use (such as, a recently constructed hotel or employee housing block)

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

shall be treated as general PP&E by identifying the cost attributable to general PP&E and segregating it from the cost of the stewardship land acquired.

79 However, no amounts for stewardship land acquired through donation or devise[FN25-A will or clause of a will disposing of property.] shall be recognized as a cost in calculating net cost. The fair value of the property, if known and material, shall be disclosed in notes to the financial statements. If fair value is not estimable, information related to the type and quantity of assets received shall be disclosed in the year received.

80 Any costs to prepare stewardship land for its intended use (for example, razing a building) shall be expensed as a part of the cost of stewardship land.

Minimum Reporting

81 Reporting at the entity level for stewardship land shall be more specific than at the governmentwide level. Minimum reporting shall include the following:

-- The number of physical units of stewardship land by category of major use, broken down within that category by principal holding agency.

-- Where parcels of stewardship land have more than one use, the predominant use of the land shall be considered the major use. Examples of major uses of stewardship land include forests and wildlife, grazing, parks, recreation, and historic sites. In cases where land has multiple uses, none of which is predominant, a description of the multiple uses shall be presented.

-- Acquisitions, withdrawals, and ending balance should be shown by major categories of use, and methods of acquisition and withdrawal identified. Reporting should be at the major category level; individual transactions, unless significant, need not be reported.

-- The condition[FN26-Examples of condition information

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

include, among others, (1) averages of standardized condition rating codes; (2) percentage of assets above, at, or below acceptable condition; or (3) narrative information.] of the stewardship land, unless it is already reported in a note to the financial statement, in which case a reference to the note will suffice.

-- A reference to the note to the financial statements if deferred maintenance is reported for the assets.[FN27-For guidance on deferred maintenance reporting, see the Deferred Maintenance standard Accounting for Property, Plant, and Equipment, SFFAS No. 6.]

Implementation Guidance

82 For guidance relating to stewardship land that was previously recognized as assets for balance sheet reporting, see SFFAS No. 6, Accounting for Property, Plant and Equipment, page 21, paragraphs 75, and 76.

****

CHAPTER 5: STANDARD - NONFEDERAL PHYSICAL PROPERTY

****

Nonfederal Physical Property - Expenses included in calculating net cost for nonfederal physical property programs shall be reported as investments in required supplementary stewardship information accompanying the financial statements of the Federal Government and the separate reports of component units of the Federal Government responsible for such investments. Reporting will include data, in nominal dollars, on investment for the year being reported upon and the preceding 4 years. Additional years' data also may be reported if such data would provide a better indication of the nature of the investment.

Definition

83 "Investment in nonfederal physical property" refers to those expenses incurred by the Federal Government for the purchase, the construction, or the major renovation of physical property owned by state and local governments, including major additions, alterations, and replacements; the purchase of major equipment; and the purchase or improvement of other physical assets. Grants

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

for maintenance and operations are not considered investments.

Measurement

84 "Expenses incurred" - The financial investment shall be measured on the same basis of accounting as used for financial statement purposes, including appropriate accrual adjustments, general and administrative overhead, and costs of facilities.[FN28-See Managerial Cost Accounting Standards for the Federal Government, SFFAS No. 4, for a full discussion of Federal cost accounting principles and standards.] Amounts shall be reported in nominal dollars.

85 Cash grants related to nonfederal physical property programs
are recognized and reported as expenses in arriving at the net cost of operations.

86 Expenses incurred for program costs, contracts, or grants with split purposes[FN29-An example of an investment with a split purpose is a grant issued to a state to construct segments of the National Highway System and to conduct highway research.] shall be reported on the basis of an allocation of the expenses. If allocation is not feasible, the investment shall be reported on the basis of the predominant application of the expense or transfer.

Minimum
Reporting

87 Minimum reporting shall include the following:

-- Annual investment[FN30-As defined in this standard,
"annual investment" includes more than the annual expenditure reported by character class for budget execution. "Annual investment" is the full cost of the investment. Full cost shall be measured and accounted for in accordance with Managerial Cost Accounting Standards for the Federal Government, SFFAS No. 4.] shall be reported, including a description of Federally-owned physical property transferred to state and local governments. This information will be provided for the year ended on the balance sheet date as well as for each of the 4 years preceding that year. If data for additional years would provide a better indication of investment, reporting of the additional years' data is encouraged. In those unusual instances when entities have no

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

historical data, only current reporting year data need be reported.

-- Reporting shall be at a meaningful category or level, for example, a major program or department. Reporting of major investments at the entity level shall be more specific than at the governmentwide level.

-- In some cases, the information called for above is not available because entities have maintained records on the basis of outlays rather than expenses. For such entities to reconstruct their accounts on the basis of expense data may be impracticable. Agencies in this situation will continue to report historical data on an outlay basis for any years for which reporting is required and for which expense data are not available. If neither historical expense nor outlay data are available for each of the 5 years, entities need report only expense data for the current reporting year and such other years as available. At the end of 5 years, however, the agency will be able to report the expenses to be categorized as investments for nonfederal physical property rather than the outlays for each of the preceding 5 years.

-- Reporting shall include a description of major programs involving Federal investments in nonfederal physical property including a description of programs or policies under which non-cash assets are transferred to state and local governments.

Recommended Reporting

88 Reporting of the amount of significant state and local total contributions to shared or joint programs is encouraged but is not required. If it is known, however, that other contributions in a significant amount were made, that fact (for example, expressed as a percentage of the total program) shall be reported even if the exact amount of the contribution is not known.

****

CHAPTER 6: STANDARD - HUMAN CAPITAL

****

Human Capital - Expenses included in calculating net cost for education and training programs that are intended to increase or

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

maintain national economic productive capacity shall be reported as investments in human capital as required supplementary stewardship information accompanying the financial statements of the Federal Government and its component units. Continued categorization of expenses as investments for stewardship purposes is predicated on demonstrated outputs and outcomes consistent with the intent of the program. Reporting will ordinarily include data in nominal dollars on investment for the year being reported upon and the preceding 4 years. Additional years' data also may be reported if such data would provide a better indication of the investment.

Definition

89 "Investment in human capital" refers to those expenses incurred for programs for education and training of the public that are intended to maintain or increase national productive capacity and that produce outputs and outcomes that provide evidence of maintaining or increasing national productive capacity.

90 The definition excludes education and training expenses for Federal civilian and military personnel. It also excludes education and training expenses whose purpose is not maintaining or enhancing national productive capacity.

Measurement

91 "Expenses incurred" - The investment shall be measured on the same basis of accounting as used for financial statements, including appropriate accrual adjustments, general and administrative overhead, and costs of facilities.[FN31-See Managerial Cost Accounting Standards for the Federal Government, SFFAS No. 4, for a full discussion of Federal cost accounting principles and standards.] Amounts shall be reported in nominal dollars.

92 Expenses incurred for programs, contracts, or grants with split purposes[FN32-An example of an investment with a split purpose is a grant issued to a teaching hospital to perform both medical education and medical research.] shall be reported on the basis of an allocation of the investment expenses. If allocation is not feasible, the investment shall be reported on the basis of the predominant application of the expenses incurred.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

93 By no later than the third year after the effective date of this standard, managers of the investment program should be able to provide information on the outcomes for the programs for which the investments are reported. If outcome data are not available (for example, the agency has not agreed on outcome measures for the program, the agency is unable to collect reliable outcome data or the outcomes will not occur for several years), output data that best provide indications of the intended program outcomes shall be used to justify continued treatment of expenses as investments until outcome data are available. Definitions and characteristics of outputs and outcomes are provided in the paragraphs that follow.[FN33-The human capital outputs and outcomes should be the same as those measured for the Government Performance and Results Act (GPRA) and the budget and could be reported in a Statement of Program Performance Measures as described in Appendix 1-F to the concepts statement entitled, Entity and Display, SFFAC No. 2.]

-- "Output" - A tabulation, calculation, or recording of activity or effort that can be expressed in a quantitative or qualitative manner. Outputs shall have two key characteristics: (1) they shall be systematically or periodically captured through an accounting or management information system, and (2) there shall be a logical connection between the reported measures and the program's purpose. Examples of human capital output are high school and college graduates as a percentage of population over 25.

-- "Outcome" - An assessment of the results of a program compared to its intended purpose. Outcomes shall: (1) be capable of being described in financial, economic, or quantitative terms and (2) provide a plausible basis for concluding that the program has had or will have its intended effect. Examples of human capital outcomes are program graduates obtaining jobs within 2 months of program completion or program graduates obtaining jobs making more money than they previously received on Federal aid.

Minimum Reporting

94 Minimum reporting shall consist of:

The annual investment[FN34-As defined in this

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

standard,
"annual investment" includes more than the annual expenditure reported by character class for budget execution. "Annual investment" is the full cost of the investment. Full cost shall be measured and accounted for in accordance with Managerial Cost Accounting Standards for the Federal Government, SFFAS No. 4.] made in the year ended on the balance sheet date as well as in each of the 4 years preceding that year shall be reported. If data for additional years would provide a better indication of investment, reporting of the additional years' data is encouraged. In those unusual instances when entities have no historical data, only current reporting year data need be reported. Reporting shall be at a meaningful category or level, for example, a major program or department. Reporting of major efforts at the entity level shall be more specific than at the governmentwide level.

-- In some cases, the information called for above will
not be available because entities have maintained records on the basis of outlays rather than expenses. For such entities to reconstruct their accounts on the basis of expense data may be impracticable. Agencies in this situation will continue to report historical data on an outlay basis for any years for which reporting is required and for which expense data are not available. If neither historical expense nor outlay data are available for each of the 5 years, entities need report expense data for only the current reporting year and such other years as available. At the end of 5 years, however, the agency will be able to report the expenses to be categorized as investments for human capital rather than the outlays for each of the preceding 5 years.

-- A narrative description of major education and training
programs considered Federal investments in human capital shall be included.

Recommended
Reporting

95 Reporting of the amount of significant state, local, private, or foreign total contributions to shared or joint programs is encouraged, but is not required. If it is known, however, that other contributions in a significant amount were made, that fact (for example, expressed as a percentage of the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

total program) may be reported even if the exact amount of the contribution is not known.

****
CHAPTER 7: STANDARD - RESEARCH AND DEVELOPMENT
****

Research and Development - Expenses included in calculating net cost for research and development programs that are intended to increase or maintain national economic productive capacity or yield other future benefits shall be reported as investments in research and development in required supplementary stewardship information accompanying the financial statements of the Federal Government and its component units. Continued categorization of program expenses as investment is predicated on output and outcome data consistent with the program's intent. Reporting ordinarily will include data in nominal dollars on investment for the year being reported upon and the preceding 4 years. Additional years' data also may be reported if such data would provide a better indication of the investment.

Definition

96 "Investment in research and development" refers to those expenses incurred to support the search for new or refined knowledge and ideas and for the application or use of such knowledge and ideas for the development of new or improved products and processes with the expectation of maintaining or increasing national economic productive capacity or yielding other future benefits. Research and development is composed of

-- Basic research: systematic study to gain knowledge or understanding of the fundamental aspects of phenomena and of observable facts without specific applications toward processes or products in mind;

-- Applied research: systematic study to gain knowledge or understanding necessary for determining the means by which a recognized and specific need may be met; and

-- Development: systematic use of the knowledge and understanding gained from research for the production of useful materials, devices, systems, or methods, including the design and development of prototypes and processes.[FN35-See OMB Circular A-

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

11, section 44.]

Measurement

97 "Expenses incurred" - The investment shall be measured on the same basis of accounting as used for financial statements, including appropriate accrual adjustments, general and administrative overhead, and costs of facilities.[FN36-See Managerial Cost Accounting Standards for the Federal Government, SFFAS No. 4, for a full discussion of Federal cost accounting principles and standards.] Amounts shall be reported in nominal dollars.

98 Expenses incurred for programs, contracts, or grants with split purposes[FN37-An example of an investment with a split purpose is a grant issued to a teaching hospital to perform both medical education and medical research.] shall be reported on the basis of an allocation of the investment expenses. If allocation is not feasible, the investment shall be reported on the basis of the predominant application of the expenses incurred.

99 By no later than the third year after the effective date of this standard, managers of the investment program should be able to provide information on the outcomes for the programs for which the investments are reported.[FN38-The research and development outputs and outcomes should be the same as those measured for the Government Performance and Results Act (GPRA) and the budget and will be reported in a Statement of Program Performance Measures as described in Appendix 1-F to Entity and Display, SFFAC No. 2.] If outcome data are not available (for example, the agency has not agreed on outcome measures for the program, the agency is unable to collect reliable outcome data, or the outcomes will not occur for several years), the outputs that best provide indications of the intended program outcomes shall be used to justify continued treatment of expenses as investments until outcome data are available. Definitions and characteristics of outputs and outcomes follow.

-- "Output" - A tabulation, calculation, or recording of activity or effort that can be expressed in a quantitative or qualitative manner. They shall have two key characteristics: (1) they shall be systematically or periodically captured through an accounting or management information system, and (2) there shall be a logical connection between the reported measures and the program's purpose. In research and development programs, this

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

might consist of data for the year concerning the number of new projects initiated, the number continued from the prior year, the number completed and the number terminated. It also might consist of such quantitative measures as bibliometrics (for example, publication counts, citation counts and analysis, and peer evaluation); patent counts and analysis; and science "indicators" that assess the ongoing vitality of the research (for example, statistics on scientific and engineering personnel, graduate students and degree recipients by field and sector).[FN39-Research Funding as an Investment: Can We Measure the Returns?, A Technical Memorandum, Congress of the United States, Office of Technology Assessment (Apr. 1986).]

-- "Outcome" - An assessment of the results of a program compared to its intended purpose. Because of the difficulty of measuring such results for research and development programs in financial, economic, or quantitative terms, outcome data for such programs are expected to consist typically of a narrative discussion of the major results achieved by the program during the year, along the following lines:

- Basic Research - an identification of any major new discoveries that were made during the year;

- Applied Research - an identification of any major new applications that were developed during the year; or

- Development - the progress of major developmental projects including the results with respect to projects completed or otherwise terminated during the year and the status of projects that will continue.

The information provided concerning outcomes should be chosen to provide, in concise form, a plausible basis for judging the extent to which the program is achieving its purpose.

Minimum Reporting

100 Minimum reporting shall consist of the following:

-- The annual investment[FN40-As defined in this standard, "annual investment" includes more than the annual expenditure reported by character class for budget execution. "Annual investment" is the full cost of the investment. Full cost shall

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

be measured and accounted for in accordance with Managerial Cost Accounting Standards for the Federal Government, SFFAS No. 4.] made in the year ended on the balance sheet date as well as in each of the 4 years preceding that year shall be reported. If data for additional years would provide a better indication of investment, reporting of the additional years' data is encouraged. In those unusual instances when entities have no historical data, only current reporting year data need be reported. Reporting shall be at a meaningful category or level, for example, a major program or department. Reporting of major investments at the entity level shall be more specific than at the governmentwide level.

-- In some cases, the information called for above will not be available because certain entities have maintained records on the basis of outlays rather than expenses. For such entities to reconstruct their accounts on the basis of expense data may be impracticable. Agencies in this situation will continue to report historical data on an outlay basis for any years for which reporting is required and for which expense data are not available. If neither historical expense nor outlay data are available for each of the 5 years, entities need report expense data for only the current reporting year and such other years as available. At the end of 5 years, however, the agency will be able to report the expenses to be categorized as research and development rather than the outlays for each of the preceding 5 years.

-- A narrative description of major research and development programs shall be included.

Recommended Reporting

101 Reporting of the amount of significant state, local, private, or foreign total contributions to shared or joint programs is encouraged, but is not required. If it is known, however, that other contributions in a significant amount were made, that fact (for example, expressed as a percentage of the total program) may be reported even if the exact amount of the contribution is not known.

****

CHAPTER 8: STANDARD - CURRENT SERVICES ASSESSMENT

****

Current Services Assessment - A Current Services Assessment (CSA) on the basis of receipt and outlay data as published in the President's Budget will be reported for all programs for the base

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

year and 6 years subsequent to the base year. "Base year" data will be actual receipt and outlay data for the last completed fiscal year; projected data will be receipt and outlay data that are included in the current services estimates in the President's Budget published after the close of the base year. The data would be presented as required supplementary stewardship information accompanying the consolidated financial statements of the Federal Government but not in individual reports of its component units. Reporting of projected data for additional years is encouraged where it would be useful and relevant.

102 "A Current Services Assessment" provides receipt and outlay data on the basis of projections of future activities. It is relevant for assessing the sustainability of programs established by current law, that is, the sufficiency of future resources to sustain public services and to meet obligations as they come due. The CSA focuses on the totality of government operations rather than on individual programs. It provides an analytical perspective on the Government because it shows the short- and long-term direction of current programs.

Measurement

103 CSA will present receipt and outlay data published in the President's Budget. Data will be presented for all programs for the base year and at least 6 years subsequent to the base year, summarized in sufficient detail to identify, at least, (1) receipts by major source (e.g., individual income taxes, social insurance taxes, etc.); (2) outlays for the defense, Social Security, Medicare, and net interest functions; (3) all other receipts and outlays; and (4) the deficit or surplus. The "base year" is the year for which the financial statements are being prepared. Reporting of projected data for additional years is encouraged where it would be useful and relevant.

104 CSA data for the 6-year projection will be identical to projected data published in the President's Budget for the same period. "Base year" data will be actual receipt and outlay data for the last completed fiscal year; projected data will be the current services estimates of receipt and outlay data that are included in the President's Budget published after the close of the base year.

Minimum

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

Reporting

Governmentwide Report of the Federal Government

105 The CSA shall present flow data as described in the two preceeding paragraphs for inclusion in the consolidated financial report of the US Government.

106 Preparers of financial reports are encouraged to experiment with the presentation of the CSA data in order to make it more understandable.

107 In some cases, summary data will be more effective than detailed data. There may be situations, too, where graphic presentations will be more effective than tabular presentations.

Reporting Entities of the Federal Government

108 None.

****

APPENDIX A

****

109 This appendix provides a discussion of the more significant comments that the Board received from respondents to the exposure draft, Supplementary Stewardship Reporting, dated August 1995 and from testimony at a public hearing on the exposure draft that was held December 5, 1995.

110 Responses overall were generally favorable to the concept of reporting stewardship information. In some cases, respondents had questions about the specific reporting requirements or requested clarification on particular items. Where feasible, these areas were addressed or clarified in the final standards in this Statement. In the case of issues raised by the respondents, this appendix explains the basis of the Board's conclusions.

The Nature of Stewardship Reporting

111 The exposure draft presented the Board's approach to reporting in a manner other than is done in the basic financial statements for those items that it has categorized as stewardship items. As the Board stated in the Introduction and Background chapter of this Statement, it believes that these stewardship items warrant specialized reporting to highlight their importance and to portray them in additional ways than provided by financial

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

accounting. The Board designated a new category of reporting to highlight the unique nature of stewardship reporting, Required Supplemental Stewardship Information (RSSI).

112 Some respondents believed that, although reporting on stewardship items might be warranted, a separate manner of reporting might not. They believed that stewardship reporting could be accommodated either within the basic financial statements, for example, as a note, or as Required Supplemental Information (RSI). They did not see the need for the separate category of RSSI.

113 The Board, however, believes that a new category for reporting on stewardship items is more appropriate. If stewardship information were required to be reported in a note to the basic financial statements, it would be subject to the same level of audit scrutiny as that of the basic financial statements. Since some of the stewardship information is non-financial, for example, physical units, and other data is based on projections or assumptions, the same degree of audit coverage as that of the basic financial statements for these items may not be appropriate. Such data is not drawn directly from the financial records. Thus reliance on financial records for audit backup would not be feasible.

114 On the other hand, the Board believes that certain stewardship information should receive more audit scrutiny than it would if it were RSI. For RSI, the auditor reviews the data for overall compliance with associated guidance and for consonance with the basic financial statements. The auditor usually provides in-depth review of the RSI only if there appears to be some problem with the data. If he or she believes that the data is not fairly presented, the auditor still may issue a clean opinion on the basic financial statements while noting that there are problems with the RSI.

115 Therefore, the Board has proposed that a new category, RSSI, be designated to cover stewardship reporting. By developing this new category, it is anticipated that audit standards will be developed to address the specific items in that category. Although the Board does not have authority to set audit standards, it established RSSI with the expectation that OMB and GAO will, in collaboration, determine appropriate audit procedures for this information.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

Social Insurance

116 Consideration of guidance for the recognition, measurement and display of obligations for social insurance programs has continued to present the Board with significant, vexing theoretical and practical problems. The Board notes the strength of feelings of respondents and commentators, some of whom believe a liability should be recognized for amounts that will be paid in future periods to or on behalf of current or future program beneficiaries and others who believe that there is no obligation associated with these programs that meets the definition of a liability, other than amounts due and payable at the end of an accounting period; additionally, some favor disclosure of projected data relating to the magnitude of the present value of future net benefit payments at a particular date while others favor cash flow information for a long period of time. The Board notes too the magnitude and complexity of these programs and the extreme sensitivity of projections relating to the programs to assumptions whose range of possibilities is large. More importantly, the Board notes that social insurance programs are presently being studied and discussed frequently and seriously within government and by the public; a report and recommendations are expected shortly from the 1994-95 Quadrennial Advisory Council on Social Security. The prospects of significant changes to the programs are reasonably high.

117 After deliberating the issue, the Board has concluded that additional investigation and further deliberation is required and has directed the FASAB staff to continue to research social insurance issues focusing especially on: identifying the characteristics of programs which should cause them to be subject to the guidance provided in a Statement on Social Insurance; the appropriate display of information in the financial statements; the identification of additional information, if any, which should be required for social insurance programs; the means for measurement of financial data included in such additional information; and, the desirability of nonfinancial indicators (ratios of data to GDP or "covered payroll") to describe the status of programs or the implications of potential changes to or needs of the programs.The Board has instructed the staff to be mindful of all current developments in structuring its research and its recommendations.

Expensing
Stewardship
PP&E

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

118 Echoing their earlier comments to the Board's Exposure Draft, Accounting for Property, Plant, and Equipment, some respondents expressed concern that expensing rather than capitalizing costs associated with stewardship PP&E would lessen the value of the operating statement as a tool for performance measurement since it would overstate the cost in the year an asset is acquired.

119 The Board, however, believes that capitalizing and depreciating stewardship PP&E provides information that is of little usefulness. Stewardship PP&E includes heritage assets, Federal mission PP&E, and stewardship land. Period costs related to stewardship PP&E are of diminished usefulness because of uncertain useful life (e.g., heritage assets, Federal mission PP&E), uncertain historical cost basis (e.g., stewardship land), or probability of being destroyed in use (e.g., Federal mission PP&E). Therefore, the Board believes that attempting to capitalize and depreciate stewardship PP&E is not warranted. It believes that reporting on information related to the existence and the condition of the stewardship PP&E has more relevance to decision-makers and other users of the financial report.

Costing of Federal
Mission PP&E

120 Respondents to the Board's question on whether the alternatives of presenting costs of Federal mission PP&E in terms of either total (historical) or latest acquisition cost generally believed that both options should not be allowed. Some believed that use of alternative methods would not ensure consistency in reporting. Others believed that only total (historical) costs should be used. Still others believed that total (historical) cost should be the long-term goal, with the use of latest acquisition cost allowed only until such historical cost data would be available.

121 The Board, however, recognizes that significant practical problems may arise if an agency is compelled to adopt a specified costing approach for reporting stewardship assets, and that such cost approach would not be used for computing the net cost of operations. Therefore, it believes that its decision to accept either the historical cost or latest acquisition cost method is appropriate. However, it also emphasizes that once a method is chosen, an entity should switch to the other method only with appropriate justification.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

Reporting Expense or Outlay Data

122 The standards require that expense data be reported for investments in human capital, research and development, and nonfederal physical property. The standards also provide for a period of 5 years to transition to reporting expense data for those agencies that currently maintain only outlay data. Some Board members suggested that since some agencies currently maintain only outlay data, requiring that only outlay data be reported might be more practical. However, the responses reflected a clear consensus for reporting expenses, with little or no support for reporting outlays only, and a minority preferring to report both expenses and outlays. Therefore, the standards, as proposed, remain unchanged.

Request for More Specificity In Reporting Requirements

123 When the Board developed the standards for stewardship reporting, its intention was to provide overall guidance on definitions, recognition, measurement, and minimum and recommended reporting. This broad guidance was intended to provide the basic reporting requirements while allowing each entity maximum flexibility in such areas as determining what constitutes the individual stewardship items for that entity, which costs are directly attributable to the stewardship item, and how best to report on multi-use items so that users will gain the best picture of the entity's financial and performance information.

124 The Board believes that the desire for more specific guidance expressed by several respondents stems from the belief that without such guidance, an entity's determination of how to apply the standards could be questioned. Nevertheless, the Board reiterates its position that entities should be provided maximum flexibility when applying the stewardship standards. However, entities should make the determination of how best to apply the stewardship standards based on a thorough analysis of their individual entity, including its mission, financial practices, and the impact of its mission and operation on financial report users and on the Nation. Finally, all entity determinations of the applicability of stewardship standards should be thoroughly documented.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

Issues for Which Changes
Were Made to the
Proposed Standards

125 Multiple Category Reporting. Some respondents were concerned that there would be double counting if, as proposed by the standards, some stewardship items would be reported in two separate categories; for example, Yellowstone National Park would be reported as a heritage asset and as stewardship land.

126 Reporting supplementary stewardship information in two categories will not be deemed double counting. This is because where multiple reporting is required, the units of measure are different for each of the stewardship categories. In the example above, Yellowstone National Park would be reported under a category, such as "National Parks," as one of the total number of heritage assets under the auspices of the Department of the Interior; it also would be reported by the number of acres that it occupies under the stewardship land category for the Department. To clarify this point, the discussion of the process of multiple reporting was expanded in the statement to explain that the Board does not consider this reporting as double counting.

127 Reporting the Fair Value for Stewardship PP&E Transferred to State or Local Governments. Many respondents questioned the need for, and the cost/benefit of, requiring that the fair value of stewardship PP&E transferred to state and local governments be reported. They stated that monetary values for stewardship PP&E are not required to be reported because such values are either difficult to obtain (e.g., lack of historical cost data on land acquired at the birth of the Nation) or not meaningful (e.g., the historical cost to build the Washington Monument). Therefore, they questioned the cost/benefit of requiring that the fair value of stewardship
property transferred to state and local governments be determined and reported.

128 The Board agreed that the fair value of stewardship property transferred to state and local governments need not be determined and reported. The standards have been revised to require a description of the property transfer transaction; if the fair value is known, nothing would preclude reporting it.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

Effective Date for Consolidated Financial Statements

129 In considering required reporting of stewardship information, the Board became increasingly aware of the need to be highly selective in proposing requirements for the consolidated financial report of the Federal Government. It recognized the potential for implementation problems in the first few years after the effective date of this statement. In addition to the normal problems associated with adapting to new standards, several of these standards provide for a transition period during which agencies may or, in some cases, may not report investments in human capital, research and development and nonfederal physical property; if investments are reported for each of five years as called for in this statement, they may be reported for earlier years during the transition period on the basis of either outlays or expense. The merit of reporting the aggregate of information prepared on different bases is questionable.

130 Further, the information required to be reported by these standards goes beyond that customarily accompanying financial reports of governments or commercial enterprises. Standards related to heritage assets and stewardship land call for reporting in terms of physical units (e.g., number of parks or acres of land) rather than in terms of historical cost. Implementation problems are foreseen at the consolidated report level because of differing measures. Also, the Board is concerned with the possibility of establishing requirements so detailed as to render the consolidated financial report unwieldy, unfriendly to the potential user and obfuscating of important information.

131 Because of these possible implementation problems and the need to consider other disclosures or presentations, the Board expressed a desire for further deliberations relative to the consolidated financial report of the Federal Government.

132 Accordingly, the effective date of this statement will be for fiscal years beginning after September 30, 1997 as it relates to financial statements of component units of the Federal Government; this same effective date applies to chapter 8 as it relates to the consolidated financial statements of the Federal Government. The effective date of the statement as it applies to the consolidated financial statements, except for chapter 8, is deferred pending further deliberations of the Board. In the interim, the consolidated financial reports should include such

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

summary or selected information as is feasible. Experimentation is encouraged, as is the reporting of such additional information as will enhance the financial report.

Reporting of Information
Not Specifically Addressed
in the Standards

133 Some respondents requested that the standards provide for reporting additional information, such as transfers of stewardship property to foreign governments, stewardship land sold to the private sector, the Federal Government's interest in such things as property held by nonfederal entities or patents generated through Federal research and development funds, and foreign contributions to Federal programs.

134 In developing the standards for stewardship reporting, the Board concentrated on providing guidance in the principal areas of stewardship resources that have materiality for the majority of Federal entities and for the consolidated financial reporting for the Nation. The Board's intent was to ensure that these significant areas, if material for an entity, would be reported regularly and in a consistent manner.

135 In some cases, an entity may have other resources or obligations that were not specifically addressed in the stewardship standards, but that the entity believes may be material to the presentation of its stewardship information. In such cases, if the reporting of such additional data would be useful and relevant to readers, and would provide a better indication of the resources and obligations of the entity, the Board encourages such reporting.

APPENDIX B OF THE SUPPLEMENTARY STEWARDSHIP REPORTING STANDARD

****

APPENDIX C: GLOSSARY

Applied research
Systematic study to gain knowledge or understanding necessary for determining the means by which a recognized and specific need may be met.

Basic research
Systematic study to gain knowledge or understanding of the fundamental aspects of phenomena and of observable facts without specific applications toward processes or products in mind.

Budgetary resources
The forms of authority given to an agency allowing it to incur obligations. Budgetary resources include the following: new budget authority, unobligated balances, direct spending authority, and obligation limitations. (A Glossary of Terms Used in the Federal Budget Process, Exposure Draft, January 1993)

Condition
The condition of an asset is based on an evaluation of the physical condition of an asset, its ability to perform as planned, and its continued usefulness. Evaluating an asset's condition requires knowledge of the asset, its performance capacity and its actual ability to perform, and expectations for its continued performance. The condition of a long-lived asset is affected by its durability, the quality of its design and construction, its use, the adequacy of maintenance that has been performed, and many other factors, including: accidents (an unforeseen and unplanned or unexpected event or circumstance), catastrophes (a tragic event), disasters (a sudden calamitous event bringing great damage, loss, or destruction), and obsolescence.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

Constant dollar
A dollar value adjusted for changes in the average price level. A constant dollar is derived by dividing a current dollar amount by a price index. The resulting constant dollar value is that which would exist if prices had remained at the same average level as in the base period. Any changes in such constant dollar values would therefore reflect only changes in the real volume of goods and services, not changes in the price level. Constant dollar figures are commonly used to compute the real value of the gross domestic product and its components and to estimate the real level of Federal receipts and outlays. (A Glossary of Terms Used in the Federal Budget Process, Exposure Draft, January 1993)

Current services
assessment
Projections of future receipts and outlays from future activities based on the programs established by current law. The CSA focuses on the totality of Government operations rather than on individual programs, and shows the short- and long-term direction of current programs.

Development
Systematic use of the knowledge and understanding gained from research for the production of useful materials, devices, systems, or methods, including the design and development of prototypes and processes.

Disclosure
Reporting information in notes or narrative regarded as an integral part of the basic financial statement. (Revenue and Other Financing Sources, SFFAS No. 7)

Expenditure
With respect to provisions of the Antideficiency Act (31 U.S.C. 1513-1514) and the Congressional Budget and Impoundment Control Act of 1974 (2 U.S.C.622(i)), a term that has the same definition as outlay. (A Glossary of Terms Used in the Federal Budget Process, Exposure Draft, January 1993)

Expense

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

Outflows or other using up of assets or incurrences of liabilities (or a combination of both) during a period from providing goods, rendering services, or carrying out other activities related to an entity's programs and missions, the benefits from which do not extend beyond the present operating period. (Accounting for Selected Assets and Liabilities, SFFAS No. 1)

Federal mission property, plant, & equipment (PP&E)
Items used to meet a Federal Government mission in which the specific PP&E used is an integral part of the output of the mission.

General PP&E land
Land and land rights owned by the Federal Government that are acquired for or in connection with items of general PP&E.

Heritage assets
Property, plant, and equipment that are unique for one or more of the following reasons: historical or natural significance; cultural, educational or artistic (e.g., aesthetic) importance; or,
significant architectural characteristics.

Human Capital
Expenses incurred for education and training programs financed by the Federal Government for the benefit of the public and designed to increase or maintain national economic productive capacity.

Land
Land is the solid part of the surface of the earth. Excluded from the definition of land are the natural resources (that is, depletable resources such as mineral deposits and petroleum; renewable resources such as timber, and the outer-continental shelf resources related to land).

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

Latest acquisition
cost (LAC) method
A method that provides that all like units that are held be valued at the invoice price of the most recent like item purchased, less any discounts, plus any additional costs incurred to bring the item to a form and location suitable for its intended use.

Maintenance
The act of keeping fixed assets in useable condition. It includes preventive maintenance, normal repairs, replacement of parts and structural components, and other activities needed to preserve the asset so that it continues to provide acceptable services and achieves its expected life. Maintenance excludes activities aimed at expanding the capacity of an asset or otherwise upgrading it in order to serve needs different than, or significantly greater than, those originally intended. (Accounting for Property, Plant, and Equipment, SFFAS No. 6)

Nonfederal Physical
Property
Physical properties financed by grants from the Federal Government, but owned by state and local governments.

Nominal dollar
The dollar value assigned to a good or service in terms of prices current at the time of the good or service is required. This contrasts with the value assigned to a good or service measured in constant dollars.

Outcome
An assessment of the results of a program compared to its intended purpose. They shall: 1) be capable of being described in financial, economic, or quantitative terms; and 2) provide a plausible basis for concluding that the program has had or will have this intended effect. For measuring outcomes for research and development programs, results may be reported by a narrative discussion of the major results achieved by the program during the year. (See para. 99 for further discussion.)

Output
A tabulation, calculation, or recording of activity or effort that can be expressed in a quantitative or qualitative manner.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

They shall have two key characteristics: 1) they shall be systematically or periodically captured through an accounting or management information system, and 2) there shall be a logical connection between the reported measures and the program's purpose.

Outlay
The issuance of checks, disbursement of cash, or electronic transfer of funds made to liquidate a Federal obligation. Outlays also occur when interest on the Treasury debt held by the public accrues and when the Government issues bonds, notes, debentures, monetary credits, or other cash-equivalent instruments in order to liquidate obligations. Also, under credit reform, the credit subsidy cost is recorded as an outlay when a direct or guaranteed loan is disbursed. (A Glossary of Terms Used in the Federal Budget Process, Exposure Draft, January 1993)

Research and
Development
Federal investment in research and development refers to those expenses incurred in support of the search for new or refined knowledge and ideas and for the application or use of such knowledge and ideas for the development of new or improved products and processes with the expectation of maintaining or increasing national economic productive capacity or yielding other future benefits. Research and development is composed of basic research, applied research, and development.

Required
Supplementary Stewardship
Information (RSSI)
The category defined by the Board for reporting information required by the stewardship standards. Stewardship information may be presented as RSSI, in the financial statements, or in the notes to them. Stewardship information will be necessary for a fair presentation of financial position and results of operations.

Space Exploration
Equipment
Items that are intended to operate above the atmosphere to explore space and any specially designed equipment to aid, service or operate other equipment engaged in exploring space.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

State and Local Governments

State and local governments generally include:

the 50 States and the District of Columbia

cities, counties, townships, school districts, specia districts, public authorities, and other local governmental units as defined by the Bureau of the Census; and

Puerto Rico, the Virgin Islands, and other US territories

Stewardship

The Federal Government's responsibility for the general welfare of the nation in perpetuity. (FASAB Concepts Statement No. 1, Objectives of Federal Financial Reporting)

Stewardship investments

Items recognized as expense in calculating net cost, but meriting special treatment to highlight the substantial investment and long-term benefit of the expenses. This would include nonfederal physical property, human capital, and research and development.

Stewardship land

Land and land rights owned by the Federal Government that are not acquired for or in connection with items of general PP&E.

Stewardship responsibilities

The projected financial impact on the Government of sustaining the current services that it provides pursuant to laws already enacted. The commitments and constraints reflected in "current services" are inherent in the tax and spending policies contained in current law.

Total cost method

An accounting method that includes the actual acquisition cost of each item held plus the costs of any additions, improvements, alterations, rehabilitations, or replacements that extend the useful life of an asset.

Weapons

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_8.pdf.

Instruments of combat used to destroy, injure, defeat or threaten an enemy. (adapted from Dictionary of Weapons and Military Terms)

Weapons Systems
A combination of one or more weapons with all related equipment, materials, services, personnel and means of delivery and deployment required for self-sufficiency. (Joint Chiefs of Staff, Department of Defense Dictionary of Military and Associated Terms, Joint Publication 1-02, Mar. 23, 1994.)

Nelson Toye

Wendy M. Comes, Executive Director

The Secretary of the Treasury, the Director of the Office of Management and Budget (OMB), and the Comptroller General established the Federal Accounting Standards Advisory Board (the FASAB or "the Board") in October 1990 to consider and recommend accounting principles for the United States Government.

The Board communicates its recommendations by publishing recommended accounting standards after considering the financial and budgetary information needs of Congress, executive branch agencies, and other users of Federal financial information. The Board also considers comments from the public on its proposed recommendations, which are published for comment as "exposure drafts." The officials who established the Board then decide whether to adopt the recommendations. If they do, the standard is published by OMB and the General Accounting Office and then becomes effective.

Additional background information is available from the FASAB, including: (1) the "Memorandum of Understanding among the General Accounting Office, the Department of the Treasury, and the Office of Management and Budget, on Federal Government Accounting Standards and a Federal Accounting Standards Advisory Board" and (2) the "Mission Statement of the Federal Accounting Standards Advisory Board."

EXECUTIVE SUMMARY

I. This statement is issued to amend the effective date of the standards in Statement of Federal Financial Accounting Standards (SFFAS) No. 4, Managerial Cost Accounting Concepts and Standards for the Federal Government, issued in July 1995. The original effective date was for reporting periods beginning after September 30, 1996. The amended effective date is for periods beginning after September 30, 1997.

II. In July 1997, the Federal Accounting Standards Advisory Board (the Board) received a request from the CFO Council for a two year deferral of the effect date of the managerial cost accounting standards to fiscal year 1999. The CFO Council representatives stated that many agencies have not been able to implement the managerial cost accounting standards during the two years since SFFAS No. 4 was issued, due to the following reasons: (a) the Joint Financial Management Improvement Program (JFMIP) has not issued its Managerial Cost Accounting System Requirements, (b) the CFO Council has not issued its managerial cost accounting guide, and (c) most agencies do not have adequate cost accounting systems in place. After considering the CFO Council's request, the Board reluctantly agreed to propose deferring the effective date of the managerial cost accounting standards for one year to fiscal year 1998 and issued an Exposure Draft (ED) for public comments. Most responses to the ED were in favor of the proposal.

III. After reviewing the comments to the ED, the Board decided to recommend the one year deferral. At the same time, it reemphasizes the importance of managerial cost accounting to Federal program and financial management. The Chief Financial Officers Act of 1990 requires the development of cost information and the systematic measurement of performance. Reliable and relevant cost information is indispensable for implementing the requirements of the Government Performance and Results Act of 1993. The Board urges Federal entities and their CFOs to give priority to implementing the requirements in SFFAS No. 4.

INTRODUCTION

1 This statement is issued to amend the effective date of the managerial cost accounting standards prescribed in Statement of Federal Financial Accounting Standards (SFFAS) No. 4, Managerial Cost Accounting Concepts and Standards for the Federal Government,[1] which was issued in July 1995. The standards in SFFAS No. 4 were effective for reporting periods beginning after September 30, 1996. The amended effective date is for reporting periods beginning after September 30, 1997.

2 In August 1997, the Board issued an exposure draft (ED)[2] in which it proposed a deferral of the effective date of managerial cost accounting standards. The ED was issued after considering a request presented to the Board by the CFO Council. (See Attachment: Letter from the CFO Council, dated June 26, 1997.) In their request, the CFO Council representatives stated that most agencies were having difficulties in implementing the cost accounting standards because (a) the Managerial Cost Accounting System Requirements have not yet been issued,[3] (b) the CFO Council has yet to issue a managerial cost accounting guide,[4] and (c) most agencies do not have adequate cost systems in place. The CFO Council representatives requested that the effective date of SFFAS No. 4 be deferred for two years to reporting periods that begin after September 30, 1998. They also requested that "relevant portions" of SFFAS 7, Accounting for Revenue and Other Financing Sources, be delayed to that same date.

---

[1]In addition to managerial cost accounting standards, SFFAS No. 4 also contains managerial cost accounting concepts which provide general guidance for managerial cost accounting but do not constitute specific requirements. The effective date does not apply to those concepts.

[2]The ED was published in FASAB News issue No. 45, August 1997.

[3]In April 1997, JFMIP issued an Exposure Draft on Managerial Cost Accounting System Requirements, which is yet to be finalized as of this date.

[4]The CFO Council's Governmentwide Cost Accounting Work Group issued an Exposure Draft of the Managerial Cost Accounting Implementation Guide on June 30, 1997, which has not been finalized as of this date.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_9.pdf.

3 After considering the reasons presented by the CFO Council, the Board reluctantly proposed a one year delay for SFFAS No. 4, to reporting periods beginning after September 30, 1997, and issued the ED for that proposal. No delay was proposed for any part of SFFAS No. 7, which is effective for reporting periods beginning after September 30, 1997. The Board noted that cost accounting is required by the Chief Financial Officers Act of 1990 (the CFO Act), and reliable cost information is necessary for implementing the Government Performance and Results Act (GPRA) of 1993. The Board also observed that the cost accounting standards allow Federal entities without a sophisticated cost accounting system to use cost studies or cost finding techniques to meet the requirements of the cost accounting standards. The Board further observed that during the past two years since SFFAS No. 4 was issued, most agencies should have had sufficient time to develop at least the basic cost accounting processes as described in paragraph 71, SFFAS No. 4.

4 The Board received 26 responses to the ED. Most respondents supported the Board's proposal for a one year deferral of the cost accounting standards in SFFAS No. 4 to fiscal year 1998. After considering the comments, including those opposed to any delay and those favoring a two year delay, the Board decided to recommend the one year deferral to the FASAB principals.

THE AMENDED EFFECTIVE DATE

5 The effective date of the managerial cost accounting standards provided in paragraph 30, SFFAS No. 4, is amended as follows:

"The managerial cost accounting standards prescribed in SFFAS No. 4 shall be effective for fiscal periods beginning after September 30, 1997. Earlier implementation is encouraged."

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_9.pdf.

BASIS FOR CONCLUSIONS

Reasons for the delay

6 After considering the CFO Council's presentation and the responses to the ED, the Board is convinced that as of the end of fiscal year 1997, most agencies were not ready to produce cost information as required in the cost accounting standards. As described in CFO Council's request and in the responses to FASAB's ED, many agencies need more time and guidance to define responsibility segments and to develop procedures for accumulating and assigning costs. They also said that they need more time to upgrade or expand their accounting systems, and to promote the use of cost measures among program and financial managers.

7 Most respondents stated that the one year delay should not significantly affect implementation of the Government Performance and Results Act of 1993 (GPRA). With regard to the GPRA requirement that Federal agencies measure and report outputs, outcomes, and related costs by segments for fiscal year 1999 and thereafter, the respondents stated that with the one year deferral of the cost accounting standards, agencies will have time to align their cost accounting structures with the GPRA measures.

8 Under these circumstances, the Board concluded that a one year deferral would be appropriate. The deferral would provide the Federal entities with an opportunity to engage top-level agency officials, budget analysts, and program and financial managers in the processes of developing, collecting and using cost information.

9 Several respondents reiterated the CFO Council's original request for a two year delay to fiscal year 1999, on the grounds that their systems would not be ready within fiscal year 1998. The Board cannot agree with this request. It believes that cost accounting capability must be developed in time to fully support the GPRA reporting. The Board thus urges Federal entities to give implementation of SFFAS No. 4 a high priority and take immediate actions to define and

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_9.pdf.

structure responsibility segments and develop costing methodologies.

10 Several respondents said that, after the effective date, Federal entities should be given a transitional period in which they could have flexibility to develop and improve their cost accounting systems and procedures gradually. The Board disagrees with this approach for two reasons: (a) such a transitional period would add uncertainty to the required implementation, (b) a degree of flexibility for developing cost accounting systems and procedures is already built in the standards, and thus a transitional provision is not necessary.

11 The Board notes that the standards already provide a sufficient degree of flexibility to Federal entities. For example, paragraph 70, SFFAS No. 4, provides that managerial cost accounting processes can be accomplished through the use of a cost accounting system or the use of cost finding techniques or other cost studies and analyses. Paragraph 266 further provides that "Federal agencies can take a gradual approach to the development of cost systems, if necessary, while developing basic cost information through other means in the short run." Federal agencies are expected to refine and improve their costing procedures, methods, and systems, as they gain experience in using cost information (paragraph 24, SFFAS No. 4). Those who are not familiar with the criteria of implementation should review the standard on "Requirement for Cost Accounting" in paragraphs 67 through 76, SFFAS No. 4.

12 Several respondents were opposed to any deferral. They pointed out that the original effective date was more than two years after SFFAS No. 4 was issued, and it provided enough lead time for agencies to implement the cost accounting standards. They stated that if the delay in implementing the standards was caused by a lack of action, a mere deferral could only cause continued inaction. The Board recognizes that many agencies have made significant progress in improving general accounting and financial reporting. The Board anticipates that the one year deferral will bring similar progress in implementing the cost accounting standards.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_9.pdf.

The Status of Interpretation No. 2

13 In January 1997, FASAB issued Interpretation No. 2, Accounting for Treasury Judgment Fund Transactions. The Treasury Judgment Fund was established by Congress to pay, in whole or part, the court judgments or settlements negotiated by the Justice Department on behalf of Federal agencies. Interpretation No. 2 requires that if a loss in litigation is probable and estimable, the reporting entity in the litigation should recognize an expense and liability for the full amount of the estimated loss, although the loss may be paid by the Treasury Judgment Fund. The Interpretation reflects the cost principle in SFFAS No. 4, and is based on the principle of recognizing contingent liabilities in SFFAS No. 5, Accounting for Liabilities of the Federal Government. The Interpretation was made effective for reporting periods beginning after September 30, 1996, the same as SFFAS No. 4 and No. 5.

14 The ED raised a question: If SFFAS No. 4 were deferred as proposed, should Interpretation No. 2 be deferred as well? Some respondents believed that Interpretation No. 2 should be deferred to fiscal year 1998. They were concerned with difficulties in collecting reliable information to estimate the probable litigation losses. Other respondents, however, did not believe that Interpretation No. 2 should be delayed for the following reasons: (1) the recognition of litigation losses and liabilities is not dependent on cost accounting capabilities, and (2) the recognition of contingent liabilities and losses is required by SFFAS No. 5, which is not deferred.

15 The Board agrees with the view that Interpretation No. 2 is based on the principle provided in SFFAS No. 5 of recognizing contingent liabilities, and that its implementation should not be deferred. As with all matters in litigation, the data should come from agencies' management and their legal offices and the Department of Justice. Deferring the Interpretation is not a positive solution to the data gathering problem.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_9.pdf.

The Status of SFFAS No. 7

16 Those respondents who preferred a two year delay for SFFAS No. 4 also reiterated the CFO Council's original request to defer certain cost-related portions of SFFAS No. 7, Accounting for Revenue and Other Financing Sources to fiscal year 1999. While no specific paragraphs were mentioned, they were concerned with the requirements for matching costs with revenues by sub-organizations (equivalent to responsibility segments). (See, for example, paragraphs 116 through 126, SFFAS No. 7.) They stated that they are modifying their systems to accommodate those requirements, but their systems work could not be completed in fiscal year 1998.

17 With the effective date of SFFAS No. 4 deferred to fiscal year 1998, the cost accounting standards should be implemented and the necessary cost information should be accumulated to support implementation of SFFAS No. 7 for that year. Thus, the Board is not convinced that SFFAS No. 7 needs to be deferred. The Board believes that it is highly important to relate SFFAS No. 4 and No. 7 to measuring program performance and results. While the standards in SFFAS No. 4 provide more detail in cost concepts, procedures, and methodologies, SFFAS No. 7 brings cost information into focus in measuring the net results of programs and activities. The integrated implementation of those two statements is crucial for meeting the objectives of financial reporting by Federal entities and for implementing the GPRA requirements.

United States Government
Chief Financial Officers Council

JUN 26, 1997

Mr. Dave Mosso, Chairman
Financial Accounting Standards Advisory Board
441 G Street, N. W.
Washington, D.C. 20548

Dear Mr. Mosso:

The Chief Financial Officers Council (CFOC) recognizes the importance for Federal agencies to move forward and implement the Statement of Federal Financial Accounting Standards (SFFAS) No.4, Managerial Cost Accounting Concepts and Standards for the Federal Government. We believe this standard, effective for reporting periods after September 30,1996, is essential to support the cost effectiveness of mission performance and to provide full accountability to taxpayers over our resources.

The Council is concerned, however, over the impediments and difficulties most agencies are having in implementing this standard. These difficulties exist due to the following:

- The Managerial Cost Accounting System Requirements have not yet been issued;

- The Managerial Cost Accounting Guidance, which will help agencies in implementing SFFAS No.4, will not be issued until later this Summer;

- Adequate cost Systems are not in place to meet the requirements of the Results Act to provide program cost and performance information in an agency's annual performance report. Agency Performance Reports required under the Results Act are not due until March 2000. It will be several years before agencies will have the necessary cost systems in place.

For the above reasons, the Council requests FASAB to change the effective date for SFFAS No.4, and in relevant portions of its companion, SFFAS No. 7, Accounting for Revenue and Other Financial Sources (effective for reporting periods after September 30,1997), to the "revised effective date" for reporting periods after September 30, 1998. Given that the systems and cost accounting guidance needed by agencies have not been issued and only 4 months remain in this fiscal year, we feel this request is justified. Additionally, this request is further supported by the fact that the Results Act Performance Report requirements are not statutorily required until FY 1999.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_9.pdf.

While we recommend a change in the effective implementation date, we fully acknowledge and support the critical importance of the cost and revenue standards. Based on the importance and usefulness of anticipated cost information for internal agency management and other purpose, in addition to the significant benefits that are often derived from early implementation of Federal accounting standards, we nevertheless encourage Federal agencies to implement these standards as soon as practicable based on the capabilities of agency systems and the maturity of agency cost accounting practices. While such early, voluntary implementation is encouraged, the Council requests that the Board change the mandatory implementation date to fiscal periods after September 30, 1998.

Specific questions regarding this request may be directed to Frank M. Sullivan, Chair, CFOC Cost Accounting Committee, at (202) 273-5504 or via E-Mail at 'fs@mail.va.gov".

Sincerely,

Arnold G. Holz
Executive Vice-Chair
Chief Financial Officers Council

THE FEDERAL ACCOUNTING STANDARDS ADVISORY BOARD

The Federal Accounting Standards Advisory Board (FASAB, or "the Board") was established in October 1990 by the Secretary of the Treasury, the Director of the Office of Management and Budget (OMB), and the Comptroller General. The nine-member Board was created to consider and recommend accounting principles for the federal government.

The Board communicates its recommendations by publishing recommended accounting standards after considering the financial and budgetary information needs of congressional oversight groups, executive agencies, and other users of federal financial information. The Board also considers comments from the public on its proposed recommendations, which are published for comments as "exposure drafts." After considering oral and written comments, the standards may be recommended by the Board. The Board's sponsors then decide whether to adopt the recommendations. If adopted, the standards are published by OMB and the General Accounting Office and become authoritative.

The following documents related to the establishment and mission of the Board are available from the FASAB:

- *"Memorandum of Understanding Between the General Accounting Office, the Department of the Treasury, and the Office of Management and Budget, on Federal Government Accounting Standards and a Federal Accounting Standards Advisory Board"*
- *"Mission Statement: Federal Accounting Standards Advisory Board"*

Executive Summary

This statement provides recommended accounting standards for internal use software. Under the provisions of this statement, internal use software is classified as "general property, plant, and equipment" (PP&E) as defined in Statement of Federal Financial Accounting Standards (SFFAS) No. 6, *Accounting for Property, Plant, and Equipment.* This statement includes software used to operate a federal entity's programs (e.g., financial and administrative software, including that used for project management) and software used to produce the entity's goods and services (e.g., air traffic control and loan servicing).

Internal use software can be purchased off-the-shelf from commercial vendors and can be developed by contractors with little technical supervision by the federal entity or developed internally by the federal entity. SFFAS No. 6 specified treatment for internally developed software different from that for commercial off-the-shelf (COTS) software and contractor-developed software. SFFAS No. 6 addressed COTS and contractor-developed software generally, providing that they were "subject to its provisions." On the other hand, specific provision was made for internally developed software.

SFFAS No. 6 prohibited the capitalization of the cost of internally developed software unless management intended to recover the cost through user charges, and the software was to be used as general PP&E. For capitalizable software, capitalization would begin after the entity completed all planning, designing, coding, and testing activities that are necessary to establish that the software can meet the design specifications.

At the conclusion of the PP&E project the Federal Accounting Standards Advisory Board discussed whether the standard for internally developed software should also apply to contractor-developed software. Also, some users of SFFAS No. 6 were unsure how to apply it to COTS and contractor-developed software. The Board decided, in December 1996, to review the issue and develop a separate standard for internal use software.

This standard requires the capitalization of the cost of internal use software whether it is COTS, contractor-developed, or internally developed. Such software serves the same purposes as other general PP&E and functions as a long-lived operating asset. This standard provides guidance regarding the types of cost elements to capitalize, the timing and thresholds of capitalization, amortization periods, accounting for impairment, and other guidance.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

Introduction

Purpose

1. This statement provides accounting standards for **internal use software**[1] used by federal entities. Federal entities purchase **commercial "off-the-shelf" (COTS) software**, hire contractors to develop substantially all of the desired **software** (**contractor-developed**), or develop software internally using their own employees, with or without a contractor's assistance (**internally developed**).

Scope

2. This statement establishes accounting standards for the **cost** of software developed or obtained for internal use. These include the cost of

- **software** used to operate an **entity's** programs (e.g., financial and administrative software, including that used for project management),
- software used to produce the entity's goods and to provide services (e.g., air traffic control and loan servicing), and
- software that is developed or obtained for internal use and subsequently provided to other federal entities with or without reimbursement.

3. This statement provides standards on accounting for software consisting of one or more components or modules. For example, an entity may develop an accounting software system containing three elements: a general ledger, an accounts payable subledger, and an accounts receivable subledger. Each element might be viewed as a component or module of the entire accounting software system. This standard may be applied to the total cost of the software or, when appropriate, to individual components or modules. For example, one software module may be implemented before others, in which case, the provisions of this standard for capitalization, **amortization**, etc., would apply to it separately.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

Background 4. At the conclusion of the general property, plant, and equipment (PP&E) project, the Federal Accounting Standards Advisory Board (Board) discussed whether the standard for **internally developed software** should also apply to contractor-developed software. Also, some users of Statement of Federal Financial Accounting Standards (SFFAS) No. 6 were unsure of how to apply it to COTS and contractor-developed software. The Board decided in December 1996 to review the issue and develop a separate standard for internal use software.

5. In June 1997, the Board issued an exposure draft entitled *Accounting for Internal Use Software*. The Board received comments from 26 respondents and held a public hearing on December 18, 1997.

Materiality 6. The provisions of this statement need not be applied to immaterial items.

Effective Date 7. The provisions of this statement are effective for reporting periods that begin after September 30, 2000. Paragraphs 27 and 28 of SFFAS No. 6, *Accounting for Property, Plant, and Equipment*, which pertain to internally developed software, are rescinded upon this standard's issuance. Federal entities may continue their current accounting practices for internal use software for accounting periods beginning before October 1, 2000. Early implementation of this statement is encouraged.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

Accounting Standard

Definitions

8. Software includes the application and operating system programs, procedures, rules, and any associated documentation pertaining to the operation of a computer system or program. "Internal use software" means software that is purchased from commercial vendors "off-the-shelf," internally developed, or contractor-developed solely to meet the entity's internal or operational needs. Normally software is an integral part of an overall system(s) having interrelationships between software, hardware, personnel, procedures, controls, and data.

9. This definition of internal use software encompasses the following:

    a. **Commercial off-the-shelf** (COTS) software: COTS software refers to software that is purchased from a vendor and is ready for use with little or no changes.

    b. Developed software

        (1) Internally developed software refers to software that employees of the entity are actively developing, including new software and existing or purchased software that are being modified with or without a contractor's assistance.

        (2) **Contractor-developed software** refers to software that a federal entity is paying a contractor to design, program, install, and implement, including new software and the modification of existing or purchased software.

Software Development Phases [2]

10. Software's life-cycle phases include planning, development, and operations. This standard provides a framework for identifying software development phases and processes to help isolate the capitalization period for internal

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

use software that the federal entity is developing.

11. The following table illustrates the various software phases and related processes. The steps within each phase of internal use software development may not follow the exact order shown below. This standard should be applied on the basis of the nature of the cost incurred, not the exact sequence of the work within each phase.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

Preliminary design phase	Software development phase`	Post-Implementation / operational phase
Conceptual formulation of alternatives[1] Evaluation and testing of alternatives Determination of existence of needed technology Final selection of alternatives	Design of chosen path, including software configuration and software interfaces[2] Coding Installation to hardware Testing, including parallel processing phase	Data conversion Application **maintenance**

12. In the *preliminary design phase*, federal entities will likely do the following:

    a. Make strategic decisions to allocate resources between alternative projects at a given time. For example, should programmers develop new software or direct their efforts toward correcting problems in existing software?

    b. Determine performance requirements (i.e., what it is that they need the software to do).

    c. Invite vendors to perform demonstrations of how their software will fulfill a federal entity's needs.

[1] See OMB Circular A-11, *Planning, Budgeting, and Acquisition of Capital Assets;* Supplement to Circular A-11, *Capital Programming Guide* (July 1997); and Circular A-109, *Major Systems Acquisitions*, par. 11, "Alternative Systems."

[2] See OMB Circular A-109, *Major Systems Acquisitions*, par. 13, "Full-Scale Development and Production."

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

d. Explore alternative means of achieving specified performance requirements. For example, should a federal entity make or buy the software? Should the software run on a mainframe or a client server system?

e. Determine that the technology needed to achieve performance requirements exists.

f. Select a vendor if a federal entity chooses to obtain COTS software.

g. Select a consultant to assist in the software's development or installation.

13. In the *software development phase*, federal entities will likely do the following:

a. Use a system to manage the project.

b. Track and accumulate life-cycle cost and compare it with performance indicators.

c. Determine the reasons for any deviations from the performance plan and take corrective action.

d. Test the deliverables to verify that they meet the specifications.

14. In the *post-implementation/operational phase*, federal entities will likely do the following:

a. Operate the software, undertake preventive maintenance, and provide ongoing training for users.

b. Convert data from the old to the new system.

c. Undertake post-implementation review comparing asset usage with

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

the original plan.

d. Track and accumulate life-cycle cost and compare it with the original plan.

Recognition, Measurement, and Disclosure

Software Used as General PP&E

15. Entities should **capitalize** the cost of software when such software meets the criteria for general property, plant, and equipment (PP&E). General PP&E is any property, plant, and equipment used in providing goods and services.[3]

Capitalizable Cost

16. For internally developed software, capitalized cost should include the **full cost** (**direct** and **indirect cost**) incurred during the software development stage.[4] Such cost should be limited to cost incurred after

    a. management authorizes and commits to a computer software project and believes that it is more likely than not that the project will be completed and the software will be used to perform the intended function with an estimated service life of 2 years or more and

    b. the completion of conceptual formulation, design, and testing of possible software project alternatives (the preliminary design stage).

17. Such costs include those for new software (e.g., salaries of programmers, systems analysts, project managers, and administrative personnel; associated employee benefits; outside consultants' fees; rent; and supplies) and documentation manuals.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

18. For COTS software, capitalized cost should include the amount paid to the vendor for the software. For contractor-developed software, capitalized cost should include the amount paid to a contractor to design, program, install, and implement the software. Material internal cost incurred by the federal entity to implement the COTS or contractor-developed software and otherwise make it ready for use should be capitalized.

Data Conversion Cost

19. All data conversion costs incurred for internally developed, contractor-developed, or COTS software should be **expensed** as incurred, including the cost to develop or obtain software that allows for access or conversion of existing data to the new software. Such cost may include the purging or cleansing of existing data, reconciliation or balancing of data, and the creation of new/additional data.

Cutoff for Capitalization

20. Costs incurred after final acceptance testing has been successfully completed should be expensed. Where the software is to be installed at multiple sites, capitalization should cease at each site after testing is complete at that site.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

Multiuse Software

21. The cost of software that serves both internal uses and stewardship purposes ("multiuse software") should be accounted for as internal use software (e.g., a global positioning system used in connection with national defense activities and general operating activities and services).

Integrated Software

22. Computer software that is integrated into and necessary to operate general PP&E, rather than perform an application, should be considered part of the PP&E of which it is an integral part and capitalized and depreciated accordingly (e.g., airport radar and computer-operated lathes). The aggregate cost of the hardware and software should be used to determine whether to capitalize or expense the costs.

Bundled Products and Services

23. Federal entities may purchase software as part of a package of products and services (e.g., training, maintenance, data conversion, reengineering, site licenses and rights to future upgrades and enhancements). Federal entities should allocate the capitalizable and noncapitalizable cost of the package among individual elements on the basis of a reasonable estimate of their relative fair values. Costs that are not susceptible to allocation between maintenance and relatively minor enhancements should be expensed.

Capitalization Thresholds

24. Each federal entity should establish its own threshold as well as guidance on applying the threshold to bulk purchases of software programs (e.g., spreadsheets, word-processing programs, etc.) and to modules or components of a total software system. That guidance should consider whether period cost would be distorted or asset values understated by expensing the purchase of numerous copies of a software application or numerous components of a software system and, if so, provide that the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

collective cost should be capitalized.

Enhancements

25. The acquisition cost of enhancements to existing internal use software (and modules thereof) should be capitalized when it is more likely than not that they will result in significant additional capabilities. For example, in an instance where the federal entity adds a capability or function to existing software for making ad hoc queries, the cost would be capitalized.

26. Enhancements normally require new software specifications and may require a change of all or part of the existing software specifications as well. The cost of minor enhancements resulting from ongoing systems maintenance should be expensed in the period incurred. Also, the purchase of enhanced versions of software for a nominal charge are properly expensed in the period incurred.

27. Cost incurred solely to repair a design flaw or to perform minor upgrades that may extend the **useful life** of the software without adding capabilities should be expensed.[5]

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

Impairment

Post-implementation/Operational Software

28. Impairment should be recognized and measured when one of the following occurs and is related to post-implementation/operational software and/or modules thereof:

    - the software is no longer expected to provide substantive service potential and will be removed from service or

    - a significant reduction occurs in the capabilities, functions, or uses of the software (or a module thereof).

29. If the impaired software is to remain in use, the loss due to impairment should be measured as the difference between the **book value** and either (1) the cost to acquire software that would perform similar remaining functions (i.e., the unimpaired functions) or, if that is not feasible, (2) the portion of book value attributable to the remaining functional elements of the software. The loss should be recognized upon impairment, and the book value of the asset reduced accordingly. If neither (1) nor (2) above can be determined, the book value should continue to be amortized over the remaining useful life of the software.

30. If the impaired software is to be removed from use, the loss due to impairment should be measured as the difference between the book value and the **net realizable value** (NRV), if any.[6] The loss should be recognized upon impairment, and the book value of the asset reduced accordingly. The NRV, if any, should be transferred to an appropriate asset account until such time as the software is disposed of and the amount is realized.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

Developmental Software

31. In instances where the managers of a federal entity conclude that it is no longer more likely than not that developmental software (or a module thereof) will be completed and placed in service, the related book value accumulated for the software (or the balance in a work in process account, if applicable) should be reduced to reflect the expected NRV, if any, and the loss recognized. The following are indications of this:

    - Expenditures are neither budgeted nor incurred for the project.
    - Programming difficulties cannot be resolved on a timely basis.
    - Major cost overruns occur.
    - Information has been obtained indicating that the cost of developing the software will significantly exceed the cost of COTS software available from third party vendors; hence, management intends to obtain the product from those vendors instead of completing the project.
    - Technologies that supersede the developing software product are introduced.
    - The responsibility unit for which the product was being created is being discontinued.

Amortization

32. Software that is capitalized pursuant to this standard should be amortized in a systematic and rational manner over the estimated useful life of the software. The estimated useful life used for amortization should be

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

consistent with that used for planning the software's acquisition.[7]

33. For each module or component of a software project, amortization should begin when that module or component has been successfully tested. If the use of a module is dependent on completion of another module(s), the amortization of that module should begin when both that module and the other module(s) have successfully completed testing.

34. Any additions to the book value or changes in useful life should be treated prospectively. The change should be accounted for during the period of the change and future periods. No adjustments should be made to previously recorded amortization. When an entity replaces existing internal use software with new software, the unamortized cost of the old software should be expensed when the new software has successfully completed testing.

Disclosures

35. The **disclosures** required by SFFAS No. 6, paragraph 45, for general PP&E are applicable to general PP&E software. Thus, for material amounts, the following should be disclosed in the financial statements regarding the software:

- The cost, associated amortization, and book value.
- The estimated useful life for each major class of software.
- The method(s) of amortization.

Implementation

36. Cost incurred prior to the initial application of this statement, whether capitalized or not, should not be adjusted to the amounts that would have been

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

capitalized, had this statement been in effect when those costs were incurred. However, the provisions of this statement concerning amortization and impairment should be applied to any unamortized cost capitalized prior to the initial application of this statement that continue to be reported as assets after the effective date.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

APPENDIX A: Basis for Conclusions

General Property, Plant, and Equipment

37. As stated in Statement of Federal Financial Accounting Standards (SFFAS) No. 6, *Accounting for Property, Plant, and Equipment*, paragraph 10, the Federal Accounting Standards Advisory Board (Board) believes that measuring the cost associated with using general property, plant, and equipment (PP&E), and including that cost in a federal entity's operating results will help to achieve the operating performance objective. To meet the operating performance objective, the Board seeks to provide accounting standards that will result in

- relevant and reliable cost information for decision-making by internal users,
- comprehensive, comparable cost information for decision-making and program evaluation by Congress and the public, and
- information to help assess the efficiency and effectiveness of asset management.

38. The Board believes that the cost of software acquired or developed for internal use that meets the SFFAS No. 6 criterion for general PP&E should be capitalized. Internal use software is specifically identifiable, can have determinate lives of 2 years or more, is not intended for sale in the ordinary course of operations, and has been acquired or constructed with the intention of being used by the entity.[8]

39. This standard does not apply to software that is an integral part of stewardship property, plant, and equipment. For example, if software is a part of a weapons systems, it would not be capitalized but included in the cost of investing in that weapons system. On the other hand, software used to accumulate the cost of acquiring that weapons system or to manage and account for that item

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

would meet the criteria for general PP&E and should be capitalized.

40. Regarding any costs of internal use software acquired or developed for stewardship PP&E or stewardship investments, the Board chose to follow SFFAS No. 6, *Accounting for Property, Plant, and Equipment*, and SFFAS No. 8, *Supplementary Stewardship Reporting*, and expense them as incurred. For example, a research project may involve new software applications for computer simulation or modeling and meet the definition of a stewardship investment in research and development. In such cases, that software should be expensed as part of that research and development stewardship investment. However, software used to manage, account for, and report on research and development projects and activities would meet the criteria for general PP&E and should be capitalized.

Comparison With SFFAS No. 6

41. As explained in the following paragraphs and in subsequent sections of the Basis for Conclusions, the accounting standard for internal use software required some tailoring of the provisions in SFFAS No. 6. First, the criteria in this standard for determining when to start amortizing/depreciating differs from SFFAS No. 6. SFFAS No. 6 provides that for constructed PP&E, depreciation begins when the PP&E is "placed in service." However, this standard defines the start of amortization for internal use software as the point when final acceptance testing is successfully completed. This additional criteria is necessary, especially for internally developed software--but also for contractor-developed and commercial off-the-shelf (COTS) software--because (1) testing plays a major role for software assets by demonstrating that the software product can meet the requirements and (2) of the need for clear point for ending the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

developmental phase.

42. A second area of tailoring involves "enhancements" and other potentially capitalizable expenditures incurred after the software and/or other general PP&E is in service. SFFAS No. 6 provides a criterion for capitalizable cost for general PP&E that is different from that required here for software enhancements. SFFAS No. 6 provides that cost incurred to either extend the useful life of existing general PP&E or to enlarge or improve its capacity should be capitalized.[3]

43. By contrast, this standard, as explained below, takes a different tack for software. It provides that material expenditures to add capability/functionality would be capitalized but expenditures that result in extending useful life or capacity would be expensed.

44. Finally, it should be noted that this standard provides additional procedures for recognizing and measuring impairment. The provisions in this standard and in SFFAS No. 6 are the same regarding situations where the software/general PP&E is impaired and will be removed from service in its entirety. Both provide that the loss is measured as the difference between the book value and the net realizable value, if any. However, as explained below, this standard also provides for instances where (1) operational software is only partly impaired and (2) developmental software becomes impaired.

Respondent's Comments

45. The respondents to the exposure draft (ED), *Accounting for Internal Use Software*, generally agreed with the principles presented therein. Most of the respondents agreed that the cost of internal use software and enhancements thereto should be capitalized, that capitalized amounts should be written down or off when the software is impaired, and that the guidance in the ED was sufficient to identify capitalizable cost and to

[3] Par. 37.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

recognize impairment. Two-thirds of the respondents agreed with the capitalization point in the ED--after (1) management authorizes and commits to funding a project and believes that it is more likely than not that the project will be successful and (2) the preliminary design stage is complete.

46. Some respondents raised objections and concerns, similar to those expressed in response to the original PP&E exposure draft, about capitalizing software, especially internally developed software. They were concerned that distinguishing between the cost of new and/or enhanced software on the one hand and maintenance and routine improvements that do not benefit future periods on the other hand would be difficult. Other respondents noted the rapidity with which technology changes and current software becomes obsolete, and said that the risky and uncertain nature of software development makes write-off much more likely for software than for general PP&E.

47. Notwithstanding these objections, the Board continues to believe that internal use software is similar to other general PP&E and should be accounted for accordingly. Internal use software and other **information technology** products and services are important resources for government operations. They are subject to similar risks of impairment and write-off and, otherwise, have general PP&E characteristics. Moreover, some respondents said they were already capitalizing their COTS software, which represents a large and growing percentage of their software portfolio.

48. The Board believes that the difference between internal use software and other general PP&E is not sufficient to justify different accounting treatment. This standard provides guidance for determining when capitalization starts and stops, how to amortize the software, how to determine and measure impairment, and other guidance.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

Cost-Benefit

49. Several of the respondents opposed the capitalization of internal use software because they do not believe that the benefits of doing so are worth the cost. The respondents are concerned about the difficulty and cost of evaluating, measuring, and tracking such information. Some respondents point especially to the difficulty of allocating federal employees' salaries and contractors' cost in multiuse contracts (e.g., systems development and maintenance).

50. Some argue (1) that capitalized internal cost related to developing internal use software is often unrelated to the software's actual value or is irrelevant, (2) that capitalization would result in arbitrary values and amortization periods, and (3) that such cost is frequently written-off, causing readers to be misled by the initial capitalization and subsequent write-off.

51. In Statement of Federal Financial Accounting Concepts No. 1, *Objectives of Federal Financial Reporting*, the Board points out that recommending accounting standards necessarily involves judgments about the cost and benefits of producing information and that standards can have different effects on different users. The Board is concerned that the benefits from standards should exceed the cost of complying with them but realizes that the benefits from standards are very hard to quantify.[4]

52. The Board is persuaded that the benefits from this standard exceed the cost. The Board believes that internal use software meets the definition of general PP&E and that general PP&E ought to be capitalized as an asset and amortized to the future periods benefited.

53. Capitalizing software contributes to the effective management of federal entities' resources. The careful measurement of the cost to construct capital assets, the matching of such cost to periods and programs benefitted on the federal

[4] Also, see OMB Circular A-130, *Management of Federal Information Resources*, par. 7d, which establishes the goal of having benefits exceed cost but notes that "the benefits to be derived from government information may not always be quantifiable."

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

entity's statement of net cost, and the comparison of cost with other alternatives for achieving the entity's goal comprise good management. Moreover, the regular review of software assets for impairment provides an early warning of problems. In short, such information provides periodic feedback about the quality and competitiveness of software products and services.[5]

54. The Board believes that expensing software costs incurred (1) in the preliminary design stage, (2) for software repairs and improvements that increase efficiency and useful life (see discussion of enhancements below), and (3) under materiality considerations will ease the burden of complying with this standard. Federal entities incur cost in the preliminary design stage exploring design and technical possibilities. Expensing this cost will limit the risk of "over-capitalization."

55. The Board realizes that software--in general--and internally developed internal use software--in particular--present difficult materiality considerations. However, the Board believes that federal entities will be able to use their discretion under the materiality provisions of federal accounting standards to set reasonable limits to capitalization and avoid incurring excessive cost in tracking de minimis items.

56. SFFAS No. 4 calls for the full cost of resources that directly and indirectly contribute to the production of outputs to be assigned to outputs through appropriate costing methodologies. Cost effectiveness is a key consideration in selecting a cost assignment method. As a general rule, directly tracing costs and assigning costs on a cause-and-effect basis are more expensive than cost allocations, because they require detailed analyses and record-keeping for costs and activities. However, they are preferable because they produce more reliable cost information than cost allocations.[6] In any case, the method used to trace, assign or allocate costs

[5] See OMB Circular A-130, par. 8a, "Information Management Policy," and par. 9b, as well as OMB's *Capital Programming Guide*, for detailed guidance on analyzing information technology through the planning, acquisition, and management-in-use phases.

[6] SFFAS No. 4, par. 143.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

must produce materially correct and complete costs.

57. The Board acknowledges that the service life of software is less predictable than that for other general PP&E. However, the Board is not persuaded that the difficulties of estimation and adjustment justify an accounting treatment different from that for other general PP&E. The Board believes that the additional guidance in the standard versus that in the ED will address the concerns raised by respondents and will be sufficient for federal entities to comply with the standard.

Cost to Be Capitalized--Direct and Indirect Cost

58. Many respondents agreed with the ED position that indirect cost should be expensed. The ED provided that such cost should be expensed because of cost-benefit considerations and the risk of over-capitalization.

59. Several respondents objected to the failure of the ED to require indirect as well as direct costs to be capitalized. Most of these respondents based their objection on the full-cost requirements in SFFAS No. 4, *Managerial Cost Accounting Concepts and Standards for the Federal Government*, believing that the Board would not be consistent with this standard unless full cost accounting were adopted.

60. The Board had reserved final judgment on the issue of capitalizing indirect cost at the time the ED was published. Several of the Board's members had argued that capitalizing only direct cost was inconsistent with SFFAS No. 4. Also, some Board members felt that, if the standard not did require indirect cost to be capitalized, the cost of internally developed internal use software would not be comparable with COTS and contractor-developed software, which would include indirect cost.

61. After reconsidering the issue, the Board is persuaded that SFFAS No. 4 requires both direct and indirect costs to be capitalized. Moreover, the new federal capital programming guidelines[7] require full life-cycle cost to be tracked,

[7] The Office of Management and Budget's (OMB) *Capital Programming Guide*, Supplement to OMB Circular A-

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

which is a more extensive requirement than that required by this standard, since it includes cost that would be expensed for accounting purposes.[8] Also, software asset values will be comparable among internally developed, COTS and contractor-developed software.

Commencing Capitalization

62. Two-thirds of the respondents agreed that capitalization should begin as described in par. 21 of the ED (and par. 16 of this standard): that is, when (1) management authorizes and commits to a software project and believes that it is more likely than not that the software will be completed and (2) the preliminary design stage is complete. Two of these respondents noted that the standard was consistent in this regard with the American Institute of Certified Public Accountant's (AICPA) draft Statement of Position(SOP).[9] Six other respondents would begin to capitalize only when "technological feasibility" is demonstrated.[10] Other respondents either would not capitalize internal use software under any circumstances or only COTS software.

63. The Board has added a framework for identifying the stages of a software project. Also, the standard now draws a sharper distinction between internally developed software on the one hand and COTS and contractor-developed software on the other. However, the Board believes that flexibility is needed so that the standard can be applied governmentwide.

11, Part 3 (July 1997), integrates the various executive branch and statutory asset management initiatives, including the Government Performance and Results Act, the Clinger-Cohen Act, and the Federal Acquisition Streamlining Act, into a single, integrated capital-programming guide.

8 "Capital assets are land, structures, equipment, and intellectual property (including software) that ... have an estimated life of two years or more... The cost of a capital asset is its full life-cycle cost, including all direct and indirect cost for planning, procurement ... operations and maintenance, including service contracts and disposal." *Capital Programming Guide*, version 1.0, definition of capital asset, p. i (July 1997).

9 Published March 4, 1998 as SOP No. 98-1.

10 "Technological feasibility" is the criteria that the Financial Accounting Standards Board (FASB) used in Statement of Financial Accounting Standards (SFAS) No. 86, *Accounting for the Costs of Computer Software to Be Sold, Leased, or Otherwise Marketed*.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

64. One respondent asked for clarification regarding management's commitment to the software project. This is critical, since it is the starting point for the capitalization of software cost. The Board believes that management's authorization and commitment are a recognizable point for major software projects. A "go/no go" decision should be a visible milestone. Management should use its best judgment to identify when its commitment to a major software project takes place.

65. The Board decided that the "technological feasibility" test in SFFAS No. 6, which follows the Financial Accounting Standard Board's Statement of Financial Accounting Standards No. 86, should be changed. The Board believes that that test is appropriate for software developed for sale or lease or otherwise marketed but is not applicable to internal use software. Federal software should be capitalized because it is a long-lived operating asset rather than inventory to be sold. However, federal entities normally do not develop software for sale. If, in a rare instance, an entity should engage to develop software for another federal entity, SFAS No. 86 would be applicable.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

Software Licenses

66. One respondent asked for guidance on accounting for licenses for COTS software. The Board had not discussed software licenses during its deliberations leading up to the publication of the ED. Software licenses can cover periods ranging from the entire estimated service life of the software (a "perpetual" license) to annual or more frequent periods and are similar to leases of general PP&E.

67. The Board believes that it would be appropriate for the federal entity to apply lease accounting concepts[11] and the entity's existing policy for capitalization thresholds and for bulk purchases to licenses. Immaterial costs would be expensed, but the entity should consider whether period costs would be distorted by expensing the license.

Capitalization Thresholds

68. In SFFAS No. 6, the Board carefully considered whether to take a prescriptive approach regarding capitalization thresholds or to permit each entity to set its threshold in light of its own particular operating environment. The Board decided that federal entities were too diverse to require one threshold for all entities; hence, the Board adopted a materiality approach whereby each entity establishes its own threshold as well as the guidance for bulk purchases. The Board continues to believe that permitting management discretion in establishing capitalization policies will lead to a more cost-effective application of the accounting standards.

[11] See SFFAS No. 5, *Accounting for Liabilities of the Federal Government*, "Capital Leases," pars. 43-46, and SFFAS No. 6, *Accounting for Property, Plant, and Equipment*, par. 20, for federal accounting standards for leases.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

Data Conversion Cost

69. The issue of whether to capitalize all, some, or no data conversion cost is a difficult one. Some argue that the cost of converting existing data to a new software system is analogous to the types of cost that the Accounting Principles Board Opinion (APB) No. 17, *Intangible Assets*, requires to be expensed as incurred because they are not specifically identifiable, have indeterminate lives, or are inherent in a continuing business and related to an enterprise as a whole--such as goodwill (APB 17, par. 24). The Board is persuaded that data conversion costs are operating costs and should be expensed.

Amortization Period

70. Most respondents said that no maximum period for amortization should be set in the standard. One respondent asked for clarification regarding the meaning of the general requirement that the amortization period be "consistent with management's plan for use." Another respondent asked whether the amortization period should begin when capitalization stops or when the system is put into use, saying that, often, there can be a significant time lag between these two events. One respondent asked for clarification regarding incremental implementation.

71. The Board has added additional guidance regarding the cessation of capitalization and commencement of amortization. The standard now focuses on the point when testing is complete. The term "operational," which some respondents found vague, is no longer used as a definitive point for cessation of capitalization. Also, provision has been made to treat each location and/or module separately.

Enhancements

72. Several respondents requested additional guidance for distinguishing maintenance from enhancements. The exposure draft proposed capitalizing the cost of changes to the existing system as an enhancement if it is more likely than not that the changes add capabilities or useful life. One respondent asked

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

whether the cost of changes that make the software or system easier to use and users more efficient, but do not significantly change the capability/functionality (i.e., the system does not do any additional tasks), should be expensed or capitalized. Also, the ED proposed that year 2000 (Y2K) cost be expensed as incurred, even though they extend useful life. Several respondents asked whether Y2K cost were "enhancements."

73. The Board believes that an "enhancement" should be limited to instances where significant new capabilities are being added to the software. Merely making the software more efficient and/or extending its service life should not constitute a capitalizable cost. Software is more fluid and malleable than other PP&E and the Board concludes that a higher threshold for additional capitalization is reasonable.

Impairment

74. Two-thirds of the respondents said that the guidance on impairment was sufficient. Several respondents had questions about how the impairment provisions would apply to particular situations.

75. A respondent asked whether the availability of a new, updated version of COTS software with significantly improved functionality, efficiency, or effectiveness means that the older version is impaired even if the older version is still performing the functions for which it was designed. He asked whether the availability of new technology, whether adapted or not, render existing software "impaired." He asked about the affect of modernizing existing software to take advantage of the new technology. This respondent was concerned that if modernization is included in the definition of "impairment," there will be constant write-downs.

76. The Board believes that none of the situations cited by the respondent would meet the criteria of this standard in paragraphs 28-31. According to the criteria, in order for software to be considered impaired, it would have to have lost its service potential such that the federal entity would plan to remove it from service or the software would have had its capabilities reduced.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

77. One respondent asked about the ED's proposal for expensing Y2K cost. Since the implementation date for this standard has been moved back to FY 2001, the issue is largely moot. However, the Board's rationale for recommending that the Y2K cost be expensed is that such cost is incurred to repair a design flaw rather than to add to the software's capabilities or useful life, although the latter would be affected.

Working Capital Funds

78. At least one respondent was concerned about the impact of capitalizing non-COTS internal use software on the cash flows, billing rates, and performance measurement of working capital funds (WCFs). This respondent said that developing software internally and through contractors could require long lead times during which WCFs would have to finance the project because WCFs could not start to recover the cost from customers until the software project was complete and amortization commences. Also, this respondent said that write-downs or write-offs due to impairment by rapidly changing technology would be difficult to recapture from customers who expect and budget for consistent billing rates. This respondent believes that the capitalization of internally developed or contractor-developed software could result in fluctuating rates depending on when new projects come "on line" and on write-downs or write-offs due to impairment.

79. This respondent said that if write-downs or write-offs cannot be recovered from customers, then capital funds would be unavailable for investment, the WCFs' equity could be seriously impaired, and the WCFs would rapidly become unable to effectively provide the services for which they were established. The respondent said that WCFs are vulnerable to capital shortages because they operate on a break-even basis rather than generate retained earnings, and because they do not have access to private capital markets. This respondent's WCF currently capitalizes COTS software because it is a proven commodity; it becomes operational immediately and the WCF can begin chargingback the cost to customers.

80. Fixed assets usually provide important future benefits but require large amounts of resources up-front and extended periods for planning and acquisition.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

Making capital planning decisions is often difficult for agencies because full budget authority is required before the acquisition can commence and the entire acquisition has an immediate budgetary impact. This makes capital assets look expensive relative to, for example, annual lease payments even though the latter may be more expensive in the longrun.[12]

81. Notwithstanding these very real concerns, the Board concludes that the WCFs problem is one of budgetary control and program finance rather than of accounting. Congress has instituted various alternatives for WCFs to acquire capital. The Board's responsibility is to recommend what it considers the best accounting treatment considering all the circumstances and the Board's objectives.

Implementation Date

82. The 23 respondents who addressed the question of the implementation date were almost evenly divided as to the feasibility of an FY 1999 implementation date. Most respondents opposing the FY 1999 date said that federal agencies do not have the cost accounting systems as yet to account for capitalized cost but are developing such capabilities. Some respondents said that most federal agencies have a great deal "on their plate" now, when one considers the many recent initiatives. They said that an FY 2000 or FY 2001 implementation date would be better.

83. One respondent said that the AICPA's SOP is effective for periods beginning after December 15, 1998, and that there is no reason for the federal government to adapt such a standard before the private sector does. The respondent said that federal implementation after the private sector implements its standard would allow the federal government to learn from the private sector's experience.

84. The Board believes that federal entities are striving to meet deadlines for audited financial statements, performance reports, cost accounting, technology

[12] See GAO, *Budget Issues: Budgeting for Federal Capital* (GAO/AIMD-97-5 Nov. 1996), for (1) an analysis of capital budgeting problems experienced by WCFs and federal agencies generally and (2) possible solutions.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

management, and other initiatives. Entities resources are under stress to meet these deadlines. Thus, the Board believes that moving the implementation to FY 2001 is reasonable.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

APPENDIX B: Glossary

Amortization--The gradual extinguishment of any amount over a period of time through a systematic allocation of the amount over a number of consecutive accounting periods.

Book value--The net amount at which an asset or group of assets is carried on the books of account (also referred to as carrying value or amount). It equals the gross amount of any asset minus any allowance or valuation amount.

Capitalize--To record and carry forward into one or more future periods all or any part of expenditures from which the benefits or proceeds will then be realized.

Commercial off-the-shelf (COTS) item--Any item, other than real property, that is of a type customarily used by the general public for nongovernmental purposes and that (1) has been sold, leased, or licensed to the general public; (2) is sold, leased, or licensed in substantial quantities in the commercial marketplace; and (3) is offered to the federal government, without modification, in the same form in which it is sold, leased, or licensed in the commercial marketplace.

Contractor-developed software--Software that the federal entity is employing a contractor to design, program, install, and implement--including new software and existing or purchased software that have been modified--without substantive employee involvement beyond contract monitoring.

Cost--The monetary value of resources used or liabilities incurred to achieve an objective. Cost may be charged to operations immediately or, in cases where the cost relates to goods or services that will benefit future periods, to an asset account for recognition as an expense of subsequent periods.

Disclosure--Reporting information in notes or narrative regarded as an integral part of the basic financial statements.

Direct cost--The cost of resources directly consumed by and specifically identified with an activity. Direct cost is assigned to activities by the direct tracing of units of resources consumed by individual activities.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

Entity--A unit within the federal government, such as a department, agency, bureau, or program, for which a set of financial statements would be prepared. Entity also encompasses a group of related or unrelated commercial functions, revolving funds, trust funds, and/or other accounts for which financial statements will be prepared in accordance with the Office of Management and Budget's annual guidance of Form and Content of Financial Statements.

Expense--Outflows or other using up of assets or incurrences of liabilities (or a combination of both) during a period from providing goods, rendering services, or carrying out other activities related to an entity's programs and missions, the benefits from which do not extend beyond the present operating period.

Full cost--The sum of all costs required by a cost object including the costs of activities performed by other entities regardless of funding sources.

Indirect cost--The cost of resources that are jointly or commonly used to produce two or more types of outputs but are not specifically identifiable with any of the outputs, e.g., general administrative services, general research and technical support, security, rent, employer health and recreation facilities, and operating and maintenance cost for buildings, equipment, and utilities. Such cost can be assigned to the output on a cause and effect basis or allocated on a reasonable and consistent basis.

Information system--A discrete set of information resources organized for the collection, processing, maintenance, transmission, and dissemination of information in accordance with defined procedures, whether automated or manual.

Information technology--Any equipment or interconnected system or subsystem of equipment used in the automatic acquisition, storage, manipulation, management, movement, control, display, switching, interchange, transmission, or reception of data or information. The term includes computers, ancillary equipment, software, firmware and similar procedures, services (including support services), and related resources.

Internal use software--Software that is purchased off-the-shelf, internally

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

developed, or contractor-developed solely to meet the entity's internal needs.

Internally developed software--Software that employees of the entity are actively developing, including new software and existing or purchased software that is being modified with or without the assistance of contractors.

Life cycle--The phases through which a software application or an information system passes, typically characterized as initiation, development, operation, and termination.

Maintenance--The act of keeping internal use software and other assets in usable condition, including preventative maintenance, normal repairs, the replacement of parts and structural components, and other activities needed to preserve the asset so that it continues to provide services and achieves its expected life. Maintenance excludes activities aimed at expanding the capacity of an asset or otherwise upgrading it to serve needs different from or significantly greater than those originally intended.

Net realizable value--The estimated amount that can be recovered from selling, or any other method of disposing of an item, less the estimated cost of completion, holding, and disposal.

Recognize--Having determined the amount, timing, classification, and other conditions precedent to the acceptance and entry of a transaction, the recording of an amount on the books of account and the reporting, other than parenthetically, of that amount on the face of the financial statements either individually or aggregated with other amounts.

Research and development--Federal research and development refers to those expenses incurred in support of the search for new or refined knowledge and ideas and for the application or use of such knowledge and ideas for the development of new or improved products and processes, with the expectation of maintaining or increasing national economic productive capacity or yielding other future benefits.

Software--The application and operating system programs, procedures, rules, and any associated documentation pertaining to the operation of a computer system.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

Stewardship PP&E--Items whose physical properties resemble general PP&E but whose value in terms of dollars (1) may be indeterminate or (2) would have little meaning (e.g., museum collections and monuments), or whose cost cannot be allocated meaningfully to accounting periods (e.g., military avionics and weapons systems and space exploration assets). Stewardship PP&E includes stewardship land, heritage assets, and federal mission PP&E (e.g., military and space exploration equipment).

Stewardship investments--Items treated as expenses in calculating net cost but meriting special treatment to highlight the substantial investment and long-term benefit of the expenses. This would include nonfederal physical property, human capital, and research and development.

Useful life--The normal operating life in terms of utility to the owner.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_10.pdf.

APPENDIX B: Glossary

The terms defined in the glossary will be in **boldface** when they first appear in the body of this document.

There are no federal requirements regarding the phases that each software project must follow. The **life-cycle** phases of a software applicatio ribed here are compatible with and generally reflect those in the Office of Management and Budget's (OMB) Circular A-130, *Management of rmation Resources*, and *Capital Programming Guidance*; the General Accounting Office's (GAO), *Measuring Performance and Demonstratin ılts of Information Technology Investments (*GAO/AIMD-98-89, Mar. 1998); and the American Institute of CPA's Statement of Position No. 9 ɔunting for the Costs of Computer Software Developed or Obtained for Internal Use* (Mar. 4, 1998). Successful software projects normally wo at least an initial design phase, an application development phase, and a post-implementation/operational phase. Also, software eventually ld become obsolete or otherwise be replaced and therefore have a termination phase. Circular A-130 acknowledges that the "life cycle varies b ıature of the **information system**. Only two phases are common to all information systems--a beginning and an end. As a result, life cycle agement techniques that agencies can use may vary depending on the complexity and risk inherent in the project." (A-130, "Analysis of Key ions," p. 63).

General PP&E, as distinguished from **stewardship PP&E**, is defined in pars. 23-25, in SFFAS No. 6, *Accounting for Property, Plant, and ipment*.

For a full discussion of direct and indirect cost, see SFFAS No. 4, *Managerial Cost Accounting Concepts and Standards for the Federal ernment* (June 1995), pars. 90-92. Also see pars. 94-95, Statement of Federal Financial Accounting Concepts No. 2, *Entity and Display*.

However, in instances where the useful life of the software is extended, the amortization period would be adjusted.

The Board has considered the cost associated with modifying internal use software for the year 2000 (Y2K) and has determined t cost should be charged to expenses as incurred, since it is a repair of a design flaw that allows existing software to continue being used. vever, an enhancement could presumably provide enhanced capabilities and at the same time, as an integral part of the new code and other ware enhancements, cure the Y2K problem. The total cost of such an enhancement should be capitalized rather than allocated between the Y2 and all other cost..

Presumably, NRV will be zero for software. However, in the rare case that it is not zero, NRV should be recognized.

For example, federal agencies use the following planning guidance: OMB Circulars A-11, *Budget Planning, Budgeting, and Acquisition of d Assets*; A-94, *Guidelines and Discount Rates for Benefit-Cost Analysis of Federal Programs*; and A-109, *Acquisition of Major Systems*; OM *ital Programming Guide* (July 1997); GAO's *Assessing Risks and Returns: A Guide for Evaluating Federal Agencies' IT Investment Decision- ing* (Feb. 1997); and other federal guidance.

See SFFAS No. 6, par. 17.

THE FEDERAL ACCOUNTING STANDARDS ADVISORY BOARD

The Federal Accounting Standards Advisory Board (FASAB or "the Board") was established in October 1990 by the Secretary of the Treasury, the Director of the Office of Management and Budget (OMB), and the Comptroller General. The nine-member Board was created to consider and recommend accounting principles for the Federal Government.

The Board communicates its recommendations by publishing recommended accounting standards after considering the financial and budgetary information needs of congressional oversight groups, executive agencies, and other users of Federal financial information. The Board also considers comments from the public on its proposed recommendations, which are published for comments as "exposure drafts." The Board's sponsors then decide whether to adopt the recommendations. If they do, the standard is published by OMB and GAO and then becomes effective.

The following documents related to the establishment and mission of the Board are available from the FASAB:

- *"Memorandum of Understanding among the General Accounting Office, the Department of the Treasury, and the Office of Management and Budget, on Federal Government Accounting Standards and a Federal Accounting Standards Advisory Board"*

- *"Mission Statement: Federal Accounting Standards Advisory Board"*

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_11.pdf.

EXECUTIVE SUMMARY

a The purpose of this Statement is to amend certain standards in Statement of Federal Financial Accounting Standards No. 6, Accounting for Property, Plant, and Equipment, (SFFAS No. 6), which was issued in November 1995; and, Statement of Federal Financial Accounting Standards No. 8, Supplementary Stewardship Reporting, (SFFAS No. 8), which was issued in June 1996. The amendments specifically affect the definition in the standards for Federal mission property, plant, and equipment (PP&E) and the classification of space exploration equipment as general PP&E in these two Statements.

b Rather than specifying types of PP&E, the original standards defined Federal mission PP&E with a set of criteria. PP&E items that met those criteria would be reported as Federal mission PP&E. Those criteria, however, were subject to inconsistent interpretations and appeared to be resulting in a broader application of Federal mission PP&E than originally intended.

c To resolve this problem, the amendments eliminated the category of Federal mission PP&E and created a new category for national defense PP&E, which consists of: (1) the PP&E components of weapons systems and support PP&E owned by the Department of Defense or its component entities for use in the performance of military missions, and (2) the vessels held in a preservation status by the Maritime Administration's National Defense Reserve Fleet. As a result space exploration equipment shall be treated as general PP&E.

INTRODUCTION

Purpose

1 The purpose of this Statement is to amend certain standards contained in Statement of Federal Financial Accounting Standards Number 6 (SFFAS No. 6), Accounting for Property, Plant, and Equipment, and Statement of Federal Financial Accounting Standards Number 8 (SFFAS No. 8), Supplementary Stewardship Reporting.

2 The amendments specifically affect the standards for:

- Federal mission property, plant, and equipment (PP&E) in SFFAS No. 6, paragraphs 21 and 46 through 52, and in SFFAS No. 8, paragraphs 52 through 59.

Background

3 In SFFAS No. 6, Federal mission PP&E are defined as PP&E having at least one characteristic from the group of characteristics related to "use" and one characteristic from the group of characteristics related to "useful life."

The "use" characteristics are:

- has no expected nongovernmental alternative uses; or
- is held for use in emergency, war, or natural disaster; or
- is specially designed for use in a program for which there is no other program or entity (Federal or non-federal, governmental or nongovernmental) using similar PP&E with which to compare costs.

The "useful life" characteristics are:

- has an indeterminate or unpredictable useful life due to the manner in which it is used, improved, retired, modified, or maintained; or
- is at a very high risk of being destroyed during use or premature obsolescence.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_11.pdf.

The Board specifically identified two types of PP&E that met the Federal mission PP&E definition: (1) the PP&E components of national defense weapons systems, and (2) space exploration equipment.

4 Since SFFAS No. 6 was issued, however, many agencies have raised questions about the applicability of the Federal mission PP&E standard. Those questions indicate that the characteristics could be interpreted by agencies in various ways and the resultant applications could be either inconsistent or far broader than originally intended. Some agencies held the view that the characteristics are ineffectual as they would depend on subjective judgment by financial statement preparers and auditors. To prevent confusion, inconsistency, and unintended application, the amendments replace the definition of Federal mission PP&E with the definition of national defense PP&E and require that space exploration equipment be accounted for and reported as general PP&E.

Effective date

5 The amending accounting standards in this statement are effective for periods beginning after September 30, 1998, with earlier implementation encouraged.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_11.pdf.

AMENDMENTS TO SFFAS No. 6

Introduction

6 Accounting standards for national defense PP&E are presented in paragraphs 8 through 14 that follow. The standards presented in these paragraphs supersede designated paragraphs in SFFAS No. 6 as they relate to Federal mission PP&E. Other paragraphs in SFFAS No. 6, which are not amended by this document, remain in effect.

7 Paragraphs 46 through 52 of SFFAS No. 6 are rescinded and replaced by paragraphs 8 through 13 below. In addition, paragraphs 21, 53 and 55 of SFFAS No. 6 are amended by replacing the category name "Federal mission property, plant, and equipment" with "national defense property, plant and equipment." Paragraph 14 provides implementation guidance.

National Defense PP&E

DEFINITION

8 National defense property, plant, and equipment (PP&E) are (1) the PP&E components of weapons systems and support PP&E owned by the Department of Defense or its component entities for use in the performance of military missions and (2) vessels held in a preservation status by the Maritime Administration's National Defense Reserve Fleet.

a "Weapons systems" are a combination of one or more weapons[1] with all related property, plant, equipment, materials, services, personnel and means of delivery and deployment required for self-sufficiency.[2]

b "Military missions" are defined as the functions performed by the

[1] Weapons are instruments of combat used to destroy, injure, defeat or threaten an enemy. Adapted from *Dictionary of Weapons and Military Terms*.

[2] *Department of Defense Dictionary of Military and Associated Terms*, Joint Publication 1-02, March 23, 1994.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_11.pdf.

Department of Defense or its component entities to prepare for the effective pursuit of war and military operations short of war; to conduct combat, peacekeeping, and humanitarian military operations; and to support civilian authorities during civil emergencies.

9 National defense PP&E components include: (a) Weapons Systems PP&E, (b) Weapons Systems Support Principal End Items, (c) Weapons Systems Support Real Property, and (d) Mission Support PP&E. These components are intended to provide guidance in identifying assets to be included in the overall national defense PP&E category. There is no requirement to report on the assets by component.

a Weapons Systems PP&E. Weapons systems PP&E is equipment that launches, releases, carries, or fires a particular piece of ordnance[3] and/or carries weapons systems-related property, equipment, materials, or personnel. Examples of weapons systems PP&E include aircraft, ships, tracked combat vehicles, and missiles.[4] Ammunition and other types of munitions (i.e., small and large caliber ammunition, rockets, grenades, mines, and other explosives) should be excluded from this category.

b Weapons Systems Support Principal End Items. These are end items[5] and replacement assemblies[6]. These items are acquired to support weapons systems and may ultimately be incorporated in weapons systems. Examples of these items include aircraft

[3] Ordnance is defined as explosives, chemicals, pyrotechnics, and similar stores, e.g., bombs, guns and ammunition, flares, smoke, napalm. *Department of Defense Dictionary of Military and Associated Terms,* Joint Publication 1-02, March 23, 1994.

[4] Missiles are unmanned, expendable, self-propelled flying vehicles with some form of guidance system that allows it to steer towards, rather than be aimed at, the target. Included are surface-to-air, air-to-air, air-to-surface, and surface to surface missiles.

[5] An end item is defined as a final combination of end products, component parts, and/or materials that is ready for its intended use, e.g., on a ship, tank, or aircraft. Adapted from *Department of Defense Dictionary of Military and Associated Terms,* Joint Publication 1-02, March 23, 1994.

[6] Replacement assembly is defined as an item forming a portion of an equipment, that can be provisioned and replaced as an entity and which normally incorporates replaceable parts or groups of parts. Adapted from *Department of Defense Dictionary of Military and Associated Terms,* Joint Publication 1-02, March 23, 1994.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_11.pdf.

engines, tank engines, aircraft radars, ship sonar, uninstalled missile motors, missile control panels, gun mounts, gun turrets, and guidance systems.

c Weapons Systems Support Real Property. Weapons Systems Support Real Property is facilities and structures affixed to the land that are integral to a weapons system. Weapons Systems Support Real Property must be:

i. Of a permanent/fixed nature;

ii. Essential to the effective operation of a weapons system; and

iii. Currently utilized to support an active weapons system.

Examples include ammunition bunkers in active use and missile silos in active use.

The land associated with Weapons Systems Support Real Property shall not be included in this category. Land shall either be classified as general PP&E or Stewardship land and accounted for accordingly.

d Mission Support PP&E. Mission support PP&E is deployable[7] PP&E that:

i. Is essential to the effective operation of a weapons system or is used by the Department of Defense or its component entities to effectively perform their military missions;

ii. Has an indeterminate or unpredictable useful life[8] due to the manner in which it is used, improved, retired, modified, or maintained; and

[7] Possessing the characteristic of being positioned and ready for use in battle. Adapted from the *Dictionary of the Modern United States Military*.

[8] This may be evidenced by the ability (1) to retire the PP&E and later return it to service or (2) to continually upgrade the PP&E to maintain its usefulness.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_11.pdf.

iii. Is at a very high risk of being destroyed during use or of premature obsolescence.

Examples of mission support PP&E include: surveillance unmanned air vehicles (UAVs), non-tactical vehicles (e.g., fuel tanker, combat operations center, mess vehicles), field meteorological systems, crypto systems, and field security systems.

10 Government Property in the Possession of Contractors. Property and equipment in the possession of or acquired directly by the Government and delivered or otherwise made available to a contractor for use in accomplishing a contract is collectively referred to as "Government property." Government property should be accounted for based on the nature of the item regardless of possession. For example, operating materials and supplies remain operating materials and supplies subject to SFFAS No. 3 standards; and general PP&E remains general PP&E subject to SFFAS No. 6 standards.

11 National defense PP&E items may be delivered or otherwise made available to a contractor either for repair or for other uses, such as testing. These items are not to be excluded from national defense PP&E simply because they are in the hands of the contractors and are not being used directly by the Department of Defense or its component entities.

12 Property Excluded. There are types of Government property that generally do not meet the definition of national defense PP&E and, therefore, are excluded. Examples of these types include: **Government Material** - material which will become part of a deliverable end item; **Special Tooling** - equipment and manufacturing aids which are used in the development or production of particular supplies or parts, or in the performance of particular services; and **Specialized Test Equipment** - test equipment which is used to accomplish special testing in performing a contract.

13 Other Items Excluded. Other items that do not meet the PP&E definition (pars. 17 through 20, SFFAS No. 6) are also excluded

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_11.pdf.

from this category. For example, operating materials and supplies and stockpiled materials should be accounted for in accordance with SFFAS No. 3, Accounting for Inventory and Related Supplies.

IMPLEMENTATION GUIDANCE

14 For entities that implemented SFFAS No. 6 in prior years, any adjustments caused by these amendments should be reflected through a prior period adjustment.[9]

9SFFAS No.7, *Accounting for Revenue and Other Financing Sources and Concepts for Reconciling Budgetary and Financial Accounting*, paragraph 76.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_11.pdf.

AMENDMENTS TO SFFAS No. 8

Introduction

15 Accounting standards for national defense PP&E are presented in paragraphs 16 through 18 that follow. The proposed standards presented in these paragraphs supersede designated paragraphs in SFFAS No. 8 as they relate to Federal mission PP&E. Other paragraphs in SFFAS No. 8, which are not amended by this document, remain in effect.

National Defense PP&E

16 The category "Federal mission property, plant, and equipment" referred to in paragraph 17, SFFAS No. 8 is replaced with "national defense property, plant, and equipment."

17 The Standard inside the box on page 21 of SFFAS No. 8 is amended by replacing the category name "Federal mission property, plant, and equipment" with "national defense property, plant and equipment." Paragraphs 52 through 59 of SFFAS No. 8 are rescinded.

DEFINITION

18 Refer to paragraphs 8 through 13 of this document.

The provisions of this statement need not be applied to immaterial items.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_11.pdf.

APPENDIX A: BASIS FOR CONCLUSIONS

19 This appendix summarizes the Board's considerations in recommending modifications to amend SFFAS No. 6, *Accounting for Property, Plant, and Equipment*, and SFFAS No. 8, *Supplementary Stewardship Reporting*, as they relate to Federal mission property, plant, and equipment (PP&E).

Background

20 The Board initially considered amendments to the definition of Federal mission PP&E due to numerous requests for interpretations to permit classifying certain property, plant, and equipment as Federal mission PP&E.

21 Based on review, presentations from affected entities, and multiple deliberations by the Board, it decided to redefine and rename Federal mission PP&E. This resulted in the elimination of the characteristics related to the "use" and the "useful life" of Federal mission PP&E and the classification of space exploration equipment as general PP&E. The decisions by the Board to redefine and rename Federal mission PP&E are discussed in the following paragraphs.

Definition

SFFAS Nos. 6 and 8 Standards

22 The Board developed the Federal mission PP&E category for "specific PP&E acquired to provide a unique good or service for which there is not necessarily a periodic output against which to match costs."[10] The Board specifically identified the PP&E components of weapons systems and space exploration equipment for this category. However, the Board believed it desirable to have "characteristics of Federal mission PP&E because it recognizes that there are other types of PP&E, or PP&E may be developed in the future that are similar to these two

[10] SFFAS No. 6, *Accounting for Property, Plant, and Equipment,* paragraph 128.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_11.pdf.

items."[11] The characteristics related to the "use" of the PP&E and to the "useful life" when used as intended.

23 Experience with the characteristics, however, revealed that they were creating confusion as to the appropriate use of the Federal mission PP&E category. Therefore, through this amendment, the Board strives to clarify which PP&E would be appropriate to include in this category. Recognizing the limitation of criteria, the Board sought more explicit means to limit the PP&E assignable to the category. Since the type of activity in which the PP&E was used would determine "whether there was a periodic output against which to match costs", the Board specifically identified the departments engaged in this type of activity. Thus, the new definition of Federal mission PP&E should limit the category to the PP&E components used in national defense.

Exposure Draft

24 In the development of a new definition for this classification of PP&E, the definition was crafted to include only the PP&E components of weapons systems and support PP&E owned by the Department of Defense or its component entities [12] for use in the performance of military missions. The DOD Board member and DOD staff assisted the Board in shaping the proposed definition by presenting DOD's definitions of specific types of assets that might be weapons systems components and/or support PP&E. The Board used the definitions provided by the DOD as the foundation for amending the definition of Federal mission PP&E. This was intended to assist in clarifying the definition and ease implementation of the standards by using existing DOD terminology where possible. Based on the new definition, the title "Federal mission PP&E" was changed to "national defense PP&E" to be more descriptive of what the standard was addressing.

[11] SFFAS No. 6., paragraph 129.

[12] The terminology "Department of Defense or its component entities" was deliberately chosen by the Board because many other departments and agencies provide some support to national defense. However, as explained in later paragraphs, the Board determined that predominant use should be considered and that cost accounting would support allocation of cost among multiple missions.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_11.pdf.

25 In connection with the Board's deliberations, the Department of Transportation (DOT) request for interpretation was addressed. DOT had requested that the Maritime Administration's National Defense Reserve Fleet (NDRF) and certain US Coast Guard vessels and aircraft also be considered national defense PP&E. The NDRF consists of ships held in a preservation status. They are activated only during a military crisis or national emergency. Their predominant use is to provide supplemental shipping capacity that the United States can rely on during a military crisis or national emergency.

26 The Board deliberated this issue and agreed that because of the NDRF's preservation status and predominant use (i.e., to provide additional shipping capacity only during military missions such as a military crisis or national emergency), that depreciation of the cost of the ships was not meaningful. Therefore, the Board believes the NDRF ships should also be considered national defense PP&E.

27 The US Coast Guard presented very difficult issues for the Board and considerable time was devoted to discussion of appropriate treatment. The Coast Guard has an important role in National defense readiness. By law, the Coast Guard may be called on to participate in times of war or national emergency and is thus considered in military strategic planning. In fact,, one of Coast Guard's four missions is "military preparedness." However, the Coast Guard has substantial ongoing responsibilities for three non-defense missions: maritime law enforcement, maritime safety, and maritime environmental protection for which operating performance is the primary reporting objective.

28 The Board believed that, conceptually, an allocation of the acquisition cost of vessels (over 65 feet) and aircraft between national defense PP&E and general PP&E would be appropriate given their multiple uses. However, based on information provided by Coast Guard, the Board determined that it would not be cost-beneficial to allocate acquisition costs between the two categories of PP&E. Ultimately, the definition of national defense PP&E was written to exclude Coast Guard's vessels and aircraft.

29 The Board based this exclusion on the need to have cost

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_11.pdf.

information to support assessment of operating performance for the three non-defense missions. The exclusion provides consistency with the full cost standards provided in SFFAS No. 4, *Managerial Cost Accounting Concepts and Standards for the Federal Government*, and with the treatment of multi-use heritage assets discussed in later paragraphs. The Board indicated that meaningful information would result if the depreciation expense on these multi-use Coast Guard assets was allocated to each of the missions served by the PP&E. This approach would be consistent with requirements in SFFAS No. 4 and OMB's Form and Content for cost information by responsibility segments and programs.

30 Also, during the discussions on national defense PP&E, the Board agreed to a request made by National Aeronautics and Space Administration to remove space exploration equipment from this category for the following reasons: 1) NASA needs cost information in performing joint missions with other countries and in billing both government and non-government entities for reimbursable services performed by NASA, and 2) The function performed by NASA with its space exploration equipment is not a unique Government function similar to defense.

Board Decision on the Definition

31 Respondents to the ED were very supportive of the revised definition. Recommended changes were few.

- One respondent suggested that the Board add a category for National defense PP&E held for destruction, sale or abandonment. The Board did not adopt this recommendation because it believes DOD has the flexibility to identify this as a major class if separate reporting is desired.

- Responses to a question posed on the appropriateness of including ammunition and munitions in this PP&E category were mixed. The Board decided to exclude it from the definition. This decision is explained more fully in a later section of this appendix.
- The Board did not receive any responses from departments or agencies that believed the definition should be broadened

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_11.pdf.

to include additional PP&E.

The Board adopted the definition largely as it was presented in the ED.

AMMUNITION AND MUNITIONS

Background

32 In discussions relating to national defense PP&E, it was suggested that ammunition and munitions are not currently addressed in the Federal financial accounting standards. Therefore, questions were posed in the ED's **QUESTIONS FOR RESPONDENTS** asking how ammunition and munitions should be categorized for accounting and reporting purposes. Definitions for these items were presented in the ED and are presented below. No comments from respondents to the ED were received which disputed or challenged their accuracy.

33 **Ammunition.** "Ammunition" is defined as a "device charged with explosives, propellants, pyrotechnics, initiating composition, or nuclear, biological or chemical material for use in connection with defense or offense, including demolition." (from the *Encyclopedia of the U.S. Military*)

34 Ammunition is portrayed as having the following characteristics:

- It is not held for sale at ammunition depots (unlike DoD inventory, which is held for sale).
- It is held for use in a normal operating cycle or in reserve for future use.
- It is not long-lived, it can be used or consumed only once.

35 Projectiles fired from a gun are the principal form of modern ammunition. Projectiles are usually in the form of bullets or artillery. Items commonly designated as ammunition include small/medium caliber ammunition, mortar ammunition, tank

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_11.pdf.

ammunition, artillery ammunition, explosive mines, bombs, torpedoes, and missiles. It should be noted that, while missiles may be commonly designated as ammunition, they have been included in the Weapons System PP&E (e.g., aircraft, ships, tracked combat vehicles, and missiles. Paragraph 9 a) component of national defense PP&E.

36 **Munitions.** "Munition" (singular) is defined as "a complete device charged with explosives, propellants, pyrotechnics, initiating composition, or nuclear, biological, or chemical material for use in military operations, including demolitions." (from the *Department of Defense Dictionary of Military and Associated Terms*) This definition is almost exactly the same as the definition for ammunition. Also, ammunition is referred to as munition (singular.)

37 Whereas, "munitions" (the plural of munition), is used in a broad sense to refer to any and all supplies and equipment required to conduct offensive and defensive war, including guns, machines, ammunition, transport and fuel; but, excluding personnel and any supplies and equipment used for purposes other than direct military operations. In common usage, "munitions" (plural) can be military weapons, ammunition, and equipment. (from the *Dictionary of Military Terms, A Guide to the Language of Warfare and Military Institutions*)

38 Based on feedback in comment letters for the ED, four options for accounting and reporting ammunition and munitions were considered by the Board. They were:

- Categorize it as operating materials for accounting and reporting purposes.
- Categorize it so that it would be included in one of the components of national defense PP&E.
- Categorize it so that it would be a separate and unique component of national defense PP&E.
- Categorize it as a separate and unique asset recognized on the balance sheet for accounting and reporting purposes.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_11.pdf.

39 During deliberations by the Board, it was noted that ammunition and munitions, although not specifically identified in the standard, were considered an item of operating materials and supplies in the development of SFFAS No. 3. SFFAS No. 3 was developed through full due process and considered some unique operating requirements of DOD. Included were provisions to categorize operating materials and supplies between those used in a normal operating cycle, those held in reserve for future use, and excess and obsolete items. Provisions to use the purchases method of accounting, instead of the consumption method of accounting, were also included in the standards. That is, if the items are not significant amounts, they are in the hands of the end user for use in normal operations, or it is not cost-beneficial to apply the consumption method.

40 Those respondents to the ED who addressed the issue were generally more in favor of categorizing ammunition and munitions as some component of national defense PP&E. Their argument was that ammunition and munitions are essential to the operations of or an integral part of weapons systems. Therefore, it seemed to these respondents that the information provided about national defense PP&E and ammunition and munitions should be the same.

41 The Board, however, did not agree with this argument and decided that ammunition and munitions should be categorized as operating materials and supplies. By categorizing ammunition and munitions as operating materials and supplies, the cost of these items would be recognized in the period they were consumed unless the conditions described in paragraph 40 of SFFAS No. 3 were met. The Board also noted that by following SFFAS No. 3 for ammunition and munitions, entities would provide similar treatment for the consumable items used each period such as training supplies and fuel.

APPENDIX C: GLOSSARY

AMMUNITION - A generic term that includes a great variety of devices designed and constructed to inflict damage upon enemy personnel or material by action of an explosive, pyrotechnic, or chemical agent.

ASSETS - Tangible or intangible items owned by the federal government which would have probable economic benefits that can be obtained or controlled by a federal government entity. (Adapted from Financial Accounting Standards Board, Statement of Concepts No. 6, *Elements of Financial Statements*, and *Kohler's Dictionary for Accountants*.)

GENERAL PROPERTY, PLANT, AND EQUIPMENT (PP&E) - PP&E used to provide government services or goods. The cost of general PP&E is capitalized, i. e. recorded as assets on the balance sheet. For detailed characteristics of and accounting for general PP&E, see paragraphs 23 through 34, SFFAS No. 6.

MILITARY MISSIONS - Functions performed by the Department of Defense or its component entities to prepare for the effective pursuit of war and military operations short of war; to conduct combat, peacekeeping, and humanitarian military operations; and to support civilian authorities during civil emergencies.

NATIONAL DEFENSE PROPERTY, PLANT, AND EQUIPMENT (PP&E) - The PP&E components of weapons systems and support PP&E owned by the Department of Defense or its component entities for use in the performance of military missions, and vessels held in a preservation status by the Maritime Administration's National Defense Reserve Fleet.

PRINCIPAL END ITEMS - End Items and replacement assemblies acquired to support weapons delivery systems and may ultimately be incorporated as integral parts in a weapons delivery system. An end item is a final combination of end products, component parts, and/or materials that is ready for its intended use. Replacement assembly is an item forming a portion of an equipment that can be provisioned and replaced as an entity and which normally incorporates replaceable parts or groups of parts.

SPACE EXPLORATION EQUIPMENT - Items that are intended to operate above the atmosphere to explore space and any specially designed equipment to aid, service or operate other equipment engaged in exploring space.

STEWARDSHIP - The Federal Government's responsibility for the general welfare of the nation in perpetuity.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_11.pdf.

USEFUL LIFE - The normal operating life in terms of utility to the owner.

WEAPONS - Instruments of combat used to destroy, injure, defeat or threaten an enemy. (adapted from *Dictionary of Weapons and Military Terms*)

WEAPONS SYSTEMS - A combination of one or more weapons with all related property, plant, equipment, materials, services, personnel and means of delivery and deployment required for self-sufficiency. (Joint Chiefs of Staff, *Department of Defense Dictionary of Military and Associated Terms*, Joint Publication 1-02, Mar. 23, 1994.)

THE FEDERAL ACCOUNTING STANDARDS ADVISORY BOARD

The Federal Accounting Standards Advisory Board (FASAB, or "the Board") was established in October 1990 by the Secretary of the Treasury, the Director of the Office of Management and Budget (OMB), and the Comptroller General. The nine-member Board was created to consider and recommend accounting principles for the federal government.

The Board communicates its recommendations by publishing recommended accounting concepts and standards after considering the financial and budgetary information needs of congressional oversight groups, executive agencies, and other users of federal financial information. The Board also considers comments from the public on its proposed recommendations, which are published for comment as "exposure drafts." After considering oral and written comments, the standards may be recommended by the Board. The Board's sponsors then decide whether to adopt the recommendations. If adopted, the standard is published by the OMB and the General Accounting Office and become effective.

The following documents related to the establishment and mission of the Board are available from the FASAB:

(1) the "Memorandum of Understanding among the General Accounting Office, the Department of the Treasury, and the Office of Management and Budget on Federal Government Accounting Standards and a Federal Accounting Standards Advisory Board"

(2) the "Mission Statement of the Federal Accounting Standards Advisory Board"

EXECUTIVE SUMMARY

This recommended accounting standard amends Statement of Federal Financial Accounting Standards Number 5, *Accounting for Liabilities of the Federal Government* (SFFAS No. 5). It provides an exception to the contingent liability standard for recognizing loss contingencies on matters of pending or threatened litigation and unasserted claims.

For loss contingencies covered by the exception, a contingent liability would be recognized[1] when a future outflow or other sacrifice of resources is "likely to occur," a past event or exchange transaction has occurred, and the future outflow or sacrifice of resources is measurable. Before the amendment, SFFAS No. 5 called for recognition when an outflow is "more likely than not." In addition to recognition, disclosure[2] would be required for loss contingencies on matters of pending or threatened litigation and unasserted claims if it is at least reasonably possible that a loss or an additional loss may have been incurred. The amendment does not affect recognition of other types of contingencies.

[1] The term "recognize" means the formal recording or incorporating of an item into the financial statements of an entity as an asset, liability, revenue, expense, etc. See FASAB Consolidated Glossary.

[2] The term "disclosure" means the reporting of information in notes or narrative regarded as an integral part of the basic financial statement. See FASAB Consolidated Glossary.

Introduction

PURPOSE

1. This Statement amends Statement of Federal Financial Accounting Standards Number 5 (SFFAS No. 5), A*ccounting for Liabilities of the Federal Government,* to provide an exception to the contingent liability standard for matters of pending or threatened litigation and unasserted claims. The proposed amendment would affect accounting for contingencies under SFFAS No. 5 by inserting an exception to the definition of "probable" and to the recognition criteria in SFFAS No. 5 (see current paragraphs 33, 36, and 38 of that standard in Appendix C).

SCOPE

2. This standard applies to evaluations and accounting recognition and disclosure of the future outcome of litigation.

BACKGROUND

3. The Federal Accounting Standards Advisory Board (FASAB) was asked to clarify the application of the standard for recognizing loss contingencies for pending or threatened litigation and unasserted claims. SFFAS No. 5 provides the definition for "liability" and establishes specific standards for five liability categories, including contingencies.

4. SFFAS No. 5 defines a contingency as an existing condition, situation, or set of circumstances involving uncertainty as to possible gain or loss.[3] SFFAS No. 5 requires a liability to be recognized for loss contingencies when a past event or exchange transaction makes a future outflow of resources probable and measurable.[4] It defines "probable" as that which can reasonably be expected or believed to be more likely than not on the basis of available evidence or logic but which is neither certain nor proven.[5]

5. SFFAS No. 5 uses the same general framework for evaluating loss contingencies as Financial Accounting Standards Board (FASB) Statement of Financial

[3] SFFAS No. 5, par. 35, and also in Appendix C.

[4] SFFAS No.5, par. 36.

[5] SFFAS No. 5, par. 33 and also see SFFAS No. 5's Glossary.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_12.pdf.

Accounting Standards No. 5, *Accounting for Contingencies* (SFAS No. 5). Contingencies can be "probable," "reasonably possible," or "remote;" and, based on that, are recognized on the balance sheet, disclosed in footnotes, or not mentioned in the financial statements, respectively. However, SFAS No. 5 defines "probable" as "likely to occur" instead of "more likely than not."[6]

6. Some auditors have expressed reservations about their ability under Statement of Auditing Standards 12 (SAS 12) to express an unqualified opinion on the entity's financial statements without a legal representation letter that refers to the SFFAS No. 5 standard. Lawyers have expressed serious objection to the definition of probable (“more likely than not”) contained in SFFAS No. 5. They state that a lawyer’s prediction of failure under the SFFAS No. 5 definition of “probable” (“more likely than not”), and the recording of a liability to reflect that judgment, could be used as an admission against interest, thereby jeopardizing the government’s ability to fairly defend the public interest. Similarly, they further state that a lawyer’s response to an auditor’s request for information on matters where an unfavorable outcome is more likely than not could result in the disclosure of information protected by the lawyer-client privilege, disadvantaging the government in any dispute, and violating the American Bar Association’s Code of Professional Responsibility.

7. The Board believes that this amendment clarifies the standard for contingencies involving pending or threatened litigation and unasserted claims and will facilitate communication among auditors, lawyers, those who prepare financial statements, and those who use the financial statements.

MATERIALITY

8. The provisions of this statement need not be applied to immaterial items.

EFFECTIVE DATE

9. This standard is effective for reports issued subsequent to the date of this statement for reporting periods beginning after September 30, 1997.

[6] SFAS No. 5, par. 3.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_12.pdf.

Accounting Standard

10. Paragraph 33 of SFFAS No. 5 is amended by adding "with the exception of pending or threatened litigation and unasserted claims" at the end of the first sentence. Paragraph 33 is further amended by adding the following footnote to the first sentence:

    The concept of probability is imprecise and difficult to apply with respect to most legal matters. The "more likely than not" phrase suggests greater precision than is attainable when assessing the outcome of matters in litigation. Accordingly, in the context of assessing the outcome of matters of pending or threatened litigation and unasserted claims, and recognizing an associated liability, "probable" refers to that which is likely, not to that which is more likely than not. Note that the remaining two criteria for recognizing a liability--that is, a past event or exchange transaction has occurred and the future outflow or sacrifice of resources is measurable--also must be met before recognizing a contingent liability in matters involving litigation.

11. Other conforming changes to SFFAS No. 5 are:

    The first bullet of paragraph 36 is changed as follows: “Probable: The future confirming event or events are more likely than not to occur, with the exception of pending or threatened litigation and unasserted claims. For pending or threatened litigation and unasserted claims, the future confirming event or events are likely to occur.”

    Paragraph 38 of SFFAS No. 5 is amended by replacing “more likely than not” in the second bullet with “likely.”

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_12.pdf.

Appendix A: Basis for Conclusions

12. In their capacity as legal counsel to federal agencies, lawyers should evaluate the outcome of matters of pending or threatened litigation and unasserted claims, and estimate any losses therefrom, in accordance with the American Bar Association's *Statement of Policy Regarding Lawyer's Responses to Auditors' Requests for Information.* Attorneys note that neither the outcome of litigation nor any loss resulting therefrom can be assessed "in any way that is comparable to a statistically or empirically determined concept of probability" (see *Auditor's Letter Handbook,* American Bar Association, page 18). The "more likely than not" phrase suggests greater precision than is attainable when assessing the outcome of matters in litigation.

13. Accordingly, in the context of such cases the standard refers simply to that which is "likely." In this context, therefore, "likely to occur" is used in federal accounting standards in the same way that it is used in Statement of Financial Accounting Standards No. 5, *Accounting for Contingencies,* published by the Financial Accounting Standards Board in 1975.

14. The Board believes that this amendment will serve the objectives of financial reporting because it will facilitate communications among auditors, lawyers, those who prepare financial statements, and those who use the statements.

15. The Board published an exposure draft of this standard on October 30, 1998, and received thirty responses, six of which had no comment. Of the 24 who commented, 22 concurred with the proposed standard. (Two responses were positive but could not be characterized as concurrence.) No respondent objected to the amendment. Five respondents suggested broadening the scope of the amendment to apply "likely to occur" to all contingent liabilities.

16. Although some respondents suggested broadening the application, the Board concluded that the amendment should be limited to contingent liabilities resulting from litigation. Most respondents concurred with this approach. The Board plans additional research on this subject in 1999.

17. The Board has made minor changes to the proposal published as an exposure draft. Several respondents suggested minor changes in wording and/or notations in paragraphs 33 and 36 in addition to or instead of paragraph 38 to

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_12.pdf.

clarify the amendment. The Board has adopted most of these suggestions.

18. The Board makes this recommendation with a vote of nine members approving issuance and no members opposing issuance.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_12.pdf.

Appendix B: Selected Section from Statement of Financial Accounting Standards No. 5, *Accounting for Contingencies.*

1. For the purposes of this Statement, a contingency is defined as an existing condition, situation, or set of circumstances involving uncertainty as to possible gain (hereinafter a "gain contingency") or loss (hereinafter a "loss contingency") to an enterprise that will ultimately be resolved when one or more future events occur or fail to occur. Resolution of the uncertainty may confirm the acquisition of an asset or the reduction of a liability or the loss or impairment of an asset or the incurrence of a liability.

* * *

3. When a loss contingency exists, the likelihood that the future event or events will confirm the loss or impairment of an asset or the incurrence of a liability can range from probable to remote. This Statement uses the terms *probable, reasonably possible,* and *remote* to identify three areas within that range, as follows:

a. *Probable*. The future event or events are likely to occur.
b. *Reasonably possible*. The chance of the future event or events occurring is more than remote but less than likely.
c. *Remote*. The chance of the future event or events occurring is slight.

* * *

8. An estimated loss from a loss contingency (as defined in paragraph 1) shall be accrued by a charge to income if *both* of the following conditions are met:

a. Information available prior to issuance of the financial statements indicates that it is probable that an asset had been impaired or a liability had been incurred at the date of the financial statement. It is implicit in this condition that it must be probable that one or more future events will occur confirming the fact of the loss.

b. The amount of the loss can be reasonably estimated.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_12.pdf.

Appendix C: Selected Sections of Statement of Federal Financial Accounting Standards No. 5, *Accounting for Liabilities of the Federal Government* (footnotes omitted).

* * *

33 "Probable" refers to that which can reasonably be expected or is believed to be more likely than not on the basis of available evidence or logic. The probability of a future outflow or other sacrifice of resources is assessed on the basis of current facts and circumstances. These current facts and circumstances include the law that provides general authority for federal entity operations and specific budget authority to fund programs. If budget authority has not yet been provided, a future outflow or other sacrifice of resources might still meet the probability test if (1) it directly relates to ongoing entity operations and (2) it is the type for which budget authority is routinely provided. Therefore, the definition applies both to liabilities covered by budgetary resources and to liabilities not covered by budgetary resources.

* * *

CONTINGENCIES

35 A contingency is an existing condition, situation, or set of circumstances involving uncertainty as to possible gain or loss to an entity. The uncertainty will ultimately be resolved when one or more future events occur or fail to occur. Resolution of the uncertainty may confirm a gain (i.e., acquisition of an asset or reduction of a liability) or a loss (i.e., loss or impairment of an asset or the incurrence of a liability).

36 This Statement does not deal with gain contingencies or measurement of contingencies that involve impairment of nonfinancial assets. When a loss contingency (i.e., contingent liability) exists, the likelihood that the future event or events will confirm the loss or the incidence of a liability can range from probable to remote. The probability classifications are as follows:

- Probable: The future confirming event or events are more likely than not to occur.
- Reasonably possible: The chances of the future confirming event or events occurring is more than remote but less than probable.
- Remote: The chance of the future event or events occurring is slight.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_12.pdf.

37 The following are some examples of loss contingencies:

- collectibility of receivables,
- pending or threatened litigation, and
- possible claims and assessments.

CRITERIA FOR RECOGNITION OF A CONTINGENT LIABILITY

38 A contingent liability should be recognized when all of these three conditions are met:

- A past event or exchange transaction has occurred (e.g., a federal entity has breached a contract with a nonfederal entity).
- A future outflow or other sacrifice of resources is probable (e.g., the nonfederal entity has filed a legal claim against a federal entity for breach of contract and the federal entity's management believes the claim is more likely than not to be settled in favor of the claimant).
- The future outflow of resources is measurable (e.g., the federal entity's management determines an estimated settlement amount).

39 The estimated liability may be a specific amount or a range of amounts. If some amount within the range is a better estimate than any other amount within the range, that amount is recognized. If no amount within the range is a better estimate than any other amount, the minimum amount in the range is recognized and the range and a description of the nature of the contingency should be disclosed.

CRITERIA FOR DISCLOSURE OF A CONTINGENT LIABILITY

40 A contingent liability should be disclosed if any of the conditions for liability recognition are not met and there is at least a reasonable possibility that a loss or an additional loss may have been incurred. "Disclosure" in this context refers to reporting information in notes regarded as an integral part of the basic financial information.

41 Disclosure should include the nature of the contingency and an estimate of the possible liability, an estimate of the range of the possible liability, or a statement that such an estimate cannot be made.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_12.pdf.

42 In some cases, contingencies may be identified but the degree of uncertainty is so great that no reporting (i.e., recognition or disclosure) is necessary in the general purpose federal financial reports. Specifically, contingencies classified as remote need not be reported in general purpose federal financial reports, though law may require such disclosures in special purpose reports. If information about remote contingencies or related to remote contingencies is included in general purpose federal financial reports (e.g., the total face amount of insurance and guarantees in force), it should be labeled in such a way to avoid the misleading inference that there is more than a remote chance of a loss of that amount.

FASAB

Federal Accounting Standards Advisory Board

DEFERRAL OF PARAGRAPH 65.2 -- MATERIAL REVENUE-RELATED TRANSACTIONS DISCLOSURES

Amending SFFAS No. 7
Accounting for Revenue and Other Financing Sources

Statement of Federal Financial Accounting Standards Number 13

January 1999

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_13.pdf.

THE FEDERAL ACCOUNTING STANDARDS ADVISORY BOARD

The Federal Accounting Standards Advisory Board (FASAB or "the Board") was established in October 1990 by the Secretary of the Treasury, the Director of the Office of Management and Budget (OMB), and the Comptroller General. The nine-member Board was created to consider and recommend accounting principles for the Federal Government.

The Board communicates its recommendations by publishing recommended accounting standards after considering the financial and budgetary information needs of congressional oversight groups, executive agencies, and other users of Federal financial information. The Board also considers comments from the public on its proposed recommendations, which are published for comments as "exposure drafts." The Board's sponsors then decide whether to adopt the recommendations. If they do, the standard is published by OMB and GAO and then becomes effective.

The following documents related to the establishment and mission of the Board are available from the FASAB:

- "Memorandum of Understanding among the General Accounting Office, the Department of the Treasury, and the Office of Management and Budget, on Federal Government Accounting Standards and a Federal Accounting Standards Advisory Board"

- "Mission Statement: Federal Accounting Standards Advisory Board"

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_13.pdf.

Background

1. Statement of Federal Financial Accounting Standards No. 7, *Accounting for Revenue and Other Financing Sources* including paragraphs 65.2 became effective for fiscal year 1998. It included detailed provisions that apply to entities collecting taxes on behalf of the Federal Government.

2. Paragraph 65.2 of SFFAS No. 7 states:

> Entities that collect taxes and duties should disclose:
>
> 65.2 **Material revenue related transactions.** Revenue-related transactions affecting the beginning and end-of-period balances of accounts receivable, accounts payable for refunds, and the allowance for uncollectible amounts should be disclosed. All material types of revenue transactions which relate to the custodial responsibilities of the collecting entities should be disclosed. The disclosure should be comprehensive enough to include as a minimum: self-assessments by the taxpayers (or importers); assessments by the entity; penalties; interest; cash collections applied to taxpayer accounts and unapplied collections; refunds, refund offsets, and drawbacks; abatements; accounts receivable written off during the reporting period as uncollectible; and provisions made to the allowance for uncollectible amounts.

3. Because of difficulties in preparing the information and questions as to its usefulness, the Board agreed to consider deletion of paragraph 65.2. Ultimately, the Board agreed that more study of the issues was needed. Accordingly, it agreed that the requirement should be deferred.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_13.pdf.

Statement of Standards

4. Paragraph 65.2 of SFFAS No. 7 is deferred three years; it will be effective for periods beginning after September 30, 2000.

Effective Date

5. This amendment is effective for fiscal periods beginning after September 30, 1998. Earlier implementation is encouraged.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_13.pdf.

6. Experience gained by IRS and GAO while attempting to implement the provisions of SFFAS No. 7 provided greater insight into the difficulties of preparing, analyzing, and communicating the information described in paragraph 65.2 than was available when SFFAS No. 7 was approved. Based on that additional experience and insight, the Board proposed that subparagraph 65.2 should be rescinded. An exposure draft to accomplish this was published in November 1998. The exposure draft included the alternative view of one Board member. He believed that subparagraph 65.2 should be retained, albeit possibly with some modification.

7. The responses received by the Board which expressed an opinion on the proposal were approximately evenly divided. Respondents supporting the deletion indicated that the requirements were calling for more detailed analysis than generally found in accounting standards, were not cost beneficial, and were potentially misleading because assessments and associated abatements are often substantially overstated. Respondents opposing the deletion indicated that the requirements were essential for proper management and oversight, necessary to overcome the limitations of the modified cash basis of accounting for tax revenues, and helpful in ensuring that systems support evaluations of activity during the year.

8. After reviewing the comment letters and redeliberating, the Board agreed that the primary question was the degree to which the information would be relevant. Some members believe the information would be relevant to users and that it, or similar information, is needed to address the objectives of federal financial reporting. Other members believe that the information presented by IRS and the GAO staff responsible for auditing the financial statements of IRS calls into question the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_13.pdf.

Board's prior conclusion that the information is relevant. Responses to the exposure draft that proposed deletion of subparagraph 65.2 did not resolve this issue. Therefore, the Board agreed that it should conduct further study regarding the relevance of the items of information discussed in subparagraph 65.2.

9. The Board concluded that the effective date for subparagraph 65.2 should be deferred three years; from fiscal year 1998 to fiscal year 2001. The Board expects to complete the study before the new effective date.

Board Approval

10. The Board approves this recommendation by a vote of eight members approving its issuance and one member opposing its issuance.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_13.pdf.

AMENDMENTS TO DEFERRED MAINTENANCE REPORTING

Amending

SFFAS No. 6 *Accounting for Property, Plant and Equipment*

and SFFAS No. 8 *Supplementary Stewardship Reporting*

Statement of Federal Financial Accounting Standards No. 14

April 1999

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_14.pdf.

THE FEDERAL ACCOUNTING STANDARDS ADVISORY BOARD

The Federal Accounting Standards Advisory Board (FASAB or "the Board") was established in October 1990 by the Secretary of the Treasury, the Director of the Office of Management and Budget (OMB), and the Comptroller General. The nine-member Board was created to consider and recommend accounting principles for the Federal Government.

The Board communicates its recommendations by publishing recommended accounting standards after considering the financial and budgetary information needs of congressional oversight groups, executive agencies, and other users of Federal financial information. The Board also considers comments from the public on its proposed recommendations, which are published for comments as "exposure drafts." The Board's sponsors then decide whether to adopt the recommendations. If they do, the standard becomes authoritative and is published by OMB and GAO.

The following documents related to the establishment and mission of the Board are available from the FASAB:

- "Memorandum of Understanding among the General Accounting Office, the Department of the Treasury, and the Office of Management and Budget, on Federal Government Accounting Standards and a Federal Accounting Standards Advisory Board"
- "Mission Statement: Federal Accounting Standards Advisory Board"

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_14.pdf.

TABLE OF CONTENTS

Executive Summary i

Introduction 1

Accounting Standards 2

Appendix A: Basis for Conclusions 3

Appendix B: Amended Standards 7

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_14.pdf.

I. Deferred maintenance reporting is a required disclosure per Statement of Federal Financial Accounting Standards No. 6, *Accounting for Property, Plant, and Equipment* (SFFAS No. 6), and is referenced in SFFAS No. 8, *Supplementary Stewardship Reporting*. This amendment does not modify the information to be provided users of federal financial statements. It does, however, modify the status of that information and thus the level of its review by financial statement auditors.

II. When SFFAS No. 6 was issued, the Board indicated that deferred maintenance reporting would evolve as preparers gained experience. *The* Board provided maximum flexibility to preparers noting that management would determine "acceptable condition" against which deferred maintenance would be assessed. (see SFFAS No. 6, par. 78, footnote 58) In addition, the Board noted that acceptable condition might vary between entities **and** between sites within the same entity. To ensure that readers would understand the deferred maintenance disclosures, the Board required that management's method of measuring deferred maintenance and management's requirements for acceptable condition be disclosed with the estimated amounts.

III. After the statement became effective, questions arose about whether this flexibility was appropriate given the status of the information as basic information (i.e., an integral part of the financial statements). The Board agreed that a change in status was warranted.

IV. This statement amends SFFAS No. 6 and SFFAS No. 8 to define deferred *maintenance* information as required supplemental information (RSI) rather than within the financial statements and the notes thereto.

V. As required supplementary information, the deferred maintenance information will be subject to the audit procedures prescribed in AU Section 558.07, *Codification of* Statements *on Auditing Standards.* These procedures include inquiries to management and comparisons of the information for consistency. In addition, the auditor should consider whether the RSI should be covered in management's representation letter. The auditor may need to apply additional procedures required by other guidance, and to make additional inquiries if necessary based on the outcome of the required procedures. Readers should refer to the most current auditing standards for relevant guidance.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_14.pdf.

Purpose

1. The purpose of this amendment is to change the status of deferred maintenance information required by Statement of Federal Financial Accounting Standard No. 6, *Accounting for Property, Plant, and Equipment*. Before amendment, this information would have been presented in association with the statement of net costs. As amended, the standards require that deferred maintenance information be included as required supplemental information (RSI). Thus, a line item for "deferred maintenance" would no longer be required on the statement of net costs with a reference to a note disclosure.

2. The Basis for Conclusions presents the reasons for these amendments.

Scope

3. The statement amends both SFFAS 6 and 8 with regard to information on deferred maintenance.

Effective Date

4. This amendment is effective for periods beginning after September 30, 1998 with earlier implementation encouraged.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_14.pdf.

Amendments to SFFAS No. 6

5. Paragraph 79 and the heading "RECOGNITION" that precedes it are deleted.

6. The section heading "DISCLOSURE REQUIREMENTS" which appears before paragraph 80 is deleted. Paragraph 80 is amended by replacing "disclosed" with "reported."

7. The section heading "Disclosures" before paragraph 83 is replaced with "Required Supplementary Information."

8. Paragraph 83 is amended by adding the phrase "as required supplementary information" between the phrases "shall be presented" and "for all PP&E." The requirement to report a range estimate when using the condition assessment survey method is modified by inserting “or a point” after the words “and a range.”

9. The section heading "Optional Disclosures" before paragraph 84 is replaced with "Optional Information." In the second sentence, the word "disclose" is replaced with “report” and the word "disclosure" is replaced with "information."

Amendments to SFFAS No. 8

10. Bullet 4 of paragraphs 50, 68 and 81 are amended by replacing "a note to the financial statements in which case a reference to the note will suffice" with "with the deferred maintenance information included elsewhere in the report in which case a reference to the information will suffice."

11. Bullet 5 of paragraphs 50, 68 and 81 are amended by replacing "a note to the financial statements" with "the information.” Footnote 15 is amended by adding "as amended by SFFAS No. 14" to the end of the footnote.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_14.pdf.

12. The Board believes that the experience gained in implementing SFFAS Nos. 6 and 8 provides greater insight into the required deferred maintenance disclosures. In recommending the deferred maintenance standards, the Board recognized that experimentation would be needed before high quality information on deferred maintenance was available throughout the federal government. However, the implementation experience brought to light concerns regarding the degree of flexibility afforded during the experimentation period and audit issues.

13. In December 1998, the Board issued an exposure draft proposing amendments intended to address the concerns being raised. The concerns included:

a) the ability of preparers to disclose an extremely large range estimate; and

b) users perceptions regarding the nature of the information[1] being presented.

14. The exposure draft proposed that deferred maintenance information be moved from being associated with the Statement of Net Cost to Required Supplementary Stewardship Information (RSSI). The Board believed that this was consistent with the importance of the information as well as the experimental nature of the information. The Board explained in the exposure draft that the information would be audited as if it were required supplemental information (RSI).

[1] While deferred maintenance information as required under the SFFAS 6 provisions is very relevant, implementation demonstrated that it may not be reliable or comparable. The Board is concerned that placement of this information in notes would be a disservice to users.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_14.pdf.

15. There were 20 respondents to the exposure draft. The respondents were from the following groups:

	Federal	Nonfederal	Total
Users and others		2	2
Preparers	9		9
Auditors	9		9
Total	18	2	20

16. One respondent opposed the proposal and stated a preference for a delayed effective date. Seventeen respondents supported the proposal and two did not directly indicate support or opposition.

17. Respondents noted the need for more detailed guidance on preparing estimates as well as specific issues such as overseas facilities which have differing facilities standards. One respondent suggested that guidance be developed for small agencies for which deferred maintenance reporting may be unnecessarily burdensome. Many respondents acknowledged the importance of the disclosures and the need to address auditing standards for deferred maintenance as well as accounting standards.

18. A number of respondents suggested that moving deferred maintenance disclosures to stewardship reports would be appropriate because doing so would:

a) lower the profile of the information,

b) prevent distortion of *financial* data,

c) reduce the resources needed to prepare and audit the data, and

d) resolve audit concerns.

19. The Board is concerned that stewardship reports – required for the first time for fiscal year 1998 reports – may be considered of

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_14.pdf.

lesser significance than “financial statements” and the associated notes. In fact, stewardship reports were intended to facilitate presentation of highly important financial and non-financial information about complex aspects of federal government operations and responsibilities. Thus the Board plans a review of the results of the implementation of stewardship reporting requirements. That review is expected to take place during calendar year 1999.

20. The Board does not believe that adding deferred maintenance information to stewardship reports would be appropriate in light of the planned review. In addition, deferred maintenance information presents measurement issues not currently experienced in stewardship reports.

21. The Board believes that a period of experimentation is desirable for deferred maintenance information and that classifying it as RSI is appropriate during the experimentation period. The use of RSI for experimentation is consistent with the practices of other standard setting bodies. For example, the Financial Accounting Standards Board (FASB) conducted a five year experiment in reporting on changing prices through RSI. During the experimentation period, FASB permitted flexibility in measuring the effects of changing prices

22. The Board believes that experimenting with deferred maintenance reporting is vitally important to improving its usefulness. The current standards for estimating deferred maintenance are intentionally flexible in the following ways:

a) either life cycle costing or condition assessment may serve as the basis for the estimates;

b) management determines the “acceptable condition” of PP&E and may vary the acceptable condition by site and type of property; and

c) engineering and/or maintenance standards are not referenced.

23. The Board intends that the Accounting and Auditing Policy Committee (AAPC) work with government-wide groups such as the Chief Financial Officers Council and the Presidents Council on Integrity and Efficiency to review the first year reports and identify areas requiring further guidance. At a minimum, the Board expects to develop guidance on determining acceptable condition. The Board

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_14.pdf.

plans to revise the standards based on experience gained during the experimentation period.

Board Approval

24. This recommended statement was approved by the Board with a vote of seven members in favor of its issuance and one member opposing its issuance. (Only eight members voted on this recommendation due to a vacancy on the Board.)

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_14.pdf.

AMENDMENTS TO SFFAS 6

DEFINITION

77. "Deferred maintenance" is maintenance that was not performed when it should have been or was scheduled to be and which, therefore, is put off or delayed for a future period.

78. For purposes of this standard, maintenance is described as the act of keeping fixed assets in acceptable condition. It includes preventive maintenance, normal repairs, replacement of parts and structural components, and other activities needed to preserve the asset so that it continues to provide acceptable services and achieves its expected life.[58] Maintenance excludes activities aimed at expanding the capacity of an asset or otherwise upgrading it to serve needs different from, or significantly greater than, those originally intended.

~~**RECOGNITION**~~

~~79. A line item for "deferred maintenance amounts"[59] shall be presented on the statement of net cost with a note reference in lieu of a dollar amount.[60] No amounts shall be recognized for deferred maintenance.~~

~~**DISCLOSURE REQUIREMENTS**~~

Measurement

80. Amounts ~~disclosed~~ reported for deferred maintenance may be measured using:

- condition assessment surveys,
- or life-cycle cost forecasts.[61]

81. *Condition assessment surveys* are periodic inspections of PP&E to determine their current condition and estimated cost to correct any

---

[58] Acceptable services and condition may vary both between entities and among sites within the same entity. Management shall determine what level of service and condition is acceptable.

[59] ~~This requirement applies to all four categories of PP&E.~~

[60] ~~If management determines that there are no material amounts of deferred maintenance, this line item need not appear.~~

[61] Other methods may be used which are similar or identical to condition assessment survey or life-cycle costing. These methods would also be acceptable sources of information on deferred maintenance.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_14.pdf.

deficiencies. It is desirable that condition assessment surveys be based on generally accepted methods and standards consistently applied.[62]

82. *Life-cycle costing* is an acquisition or procurement technique which considers operating, maintenance, and other costs in addition to the acquisition cost of assets. Since it results in a forecast of maintenance expense, these forecasts may serve as a basis against which to compare actual maintenance expense and estimate deferred maintenance.

~~Disclosures~~Required Supplementary Information

83. At a minimum, the following information shall be presented as required supplementary information for all PP&E (each of the four categories established in the PP&E standard should be included).

- Identification of each major class[63] of asset for which maintenance has been deferred.
- Method of measuring deferred maintenance for each major class of PP&E.
- If the condition assessment survey method of measuring deferred maintenance is used, the following should be presented for each major class of PP&E:
  - description of requirements or standards for acceptable operating condition,
  - any changes in the condition requirements or standards, and
  - asset condition[64] and a range or a point estimate of the dollar amount of maintenance needed to return it to its acceptable operating condition.

[62]Management shall determine what methods and standards to apply. Once determined, it is desirable but not required that methods and standards be applied consistently from period to period.

[63]"Major classes" of general PP&E shall be determined by the entity. Examples of major class include, among others, buildings and structures, furniture and fixtures, equipment, vehicles, and land.

[64]Examples of condition information include, among others, (1) averages of standardized condition rating codes, (2) percentage of assets above, at or below acceptable condition, or (3) narrative information.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_14.pdf.

- If the total life-cycle cost method is used the following should be presented for each major class of PP&E:
  - the original date of the maintenance forecast and an explanation for any changes to the forecast,
  - prior year balance of the cumulative deferred maintenance amount,
  - the dollar amount of maintenance that was defined by the professionals who designed, built or manage the PP&E as required maintenance for the reporting period,
  - the dollar amount of maintenance actually performed during the period,
  - the difference between the forecast and actual maintenance,
  - any adjustments to the scheduled amounts deemed necessary by the managers of the PP&E,[65] and
  - the ending cumulative balance for the reporting period for each major class of asset experiencing deferred maintenance.

Optional Information ~~Disclosures~~

84. Stratification between critical and noncritical amounts of maintenance needed to return each major class of asset to its acceptable operating condition. If management elects to report ~~disclose~~ critical and noncritical amounts, the information ~~disclosure~~ shall include management's definition of these categories.

The provisions of this statement need not be applied to immaterial items.

[65] Adjustments may be necessary because the cost of maintenance foregone may not be cumulative. For example, if periodic painting is skipped twice it is not necessarily true that the cost would be double the scheduled amount.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_14.pdf.

AMENDMENTS TO SFFAS 8

Paragraphs 50, 68 and 81 of SFFAS 8 as amended with respect to condition reporting are shown below:

Heritage Assets

50. (fourth bullet) Condition of the assets[14] unless it is already reported in ~~required supplementary information~~ deferred maintenance information included elsewhere in the report in which case a reference to the information will suffice. ~~a note to the financial statements in which case a reference to the note will suffice~~.

(fifth bullet) A reference to the information ~~a note to the financial statements~~ if deferred maintenance is reported for the assets.[15]

National Defense PP&E

68. (fourth bullet) Condition of the assets[21] unless it is already reported ~~required supplementary information~~ deferred maintenance information included elsewhere in the report in which case a reference to the information will suffice ~~a note to the financial statements in which case a reference to the note will suffice~~.

(fifth bullet) A reference to the information ~~the applicable note to the financial statements~~ if deferred maintenance is reported for the assets.

Stewardship Land

81. (fourth bullet) Condition[26] of the stewardship land, unless it is already reported in ~~required supplementary information~~ deferred

---

[14] Examples of condition information include, among others, (1) averages of standardized condition rating codes; (2) percentage of assets at, or below acceptable condition; or (3) narrative information.

[15] For guidance relating to deferred maintenance reporting, see the Deferred Maintenance standard in *Accounting for Property, Plant, and Equipment,* SFFAS No. 6.

[21] Examples of condition information include, among others, (1) averages of standardized condition rating codes; (2) percentage of assets at, or below acceptable condition; or (3) narrative information.

[26] Examples of condition information include, among others, (1) averages of standardized condition rating codes; (2) percentage of assets at, or below acceptable condition; or (3) narrative information.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_14.pdf.

maintenance information included elsewhere in the report in which case a reference to the information will suffice. ~~a note to the financial statements in which case a reference to the note will suffice~~.

(fifth bullet) A reference to the information ~~a note to the financial statements~~ if deferred maintenance is reported for the assets.[27]

[27]For guidance on deferred maintenance reporting, see the Deferred Maintenance standard Accounting for Property, Plant, and Equipment, SFFAS No. 6.

MANAGEMENT'S DISCUSSION AND ANALYSIS

April 1999

THE FEDERAL ACCOUNTING STANDARDS ADVISORY BOARD

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_15.pdf.

The Secretary of the Treasury, the Director of the Office of Management and Budget, and the Comptroller General established the Federal Accounting Standards Advisory Board (the FASAB or "the Board")in October 1990 to consider and recommend accounting principles for the United States Government.

The Board communicates its recommendations by publishing recommended accounting concepts and standards after considering the financial and budgetary information needs of Congress, executive branch agencies, and other users of federal financial information. The Board also considers comments from the public on its proposed recommendations, which are published for comment as "exposure drafts." The three officials who established the Board then decide whether to adopt the recommendations. If they do, the standard is published by the OMB and the GAO and becomes effective.

Additional background information is available from the FASAB, including: (1) the "Memorandum of Understanding among the General Accounting Office, the Department of the Treasury, and the Office of Management and Budget on Federal Government Accounting Standards and a Federal Accounting Standards Advisory Board" and (2) the "Mission Statement of the Federal Accounting Standards Advisory Board."

EXECUTIVE SUMMARY

This document establishes standards for preparing Management's Discussion and Analysis (MD&A). MD&A is an important vehicle for (1) communicating managers' insights about the reporting entity, (2) increasing the understandability and usefulness of the general purpose federal financial report (GPFFR),[1] and (3) providing understandable and accessible information about the entity and its operations, service levels, successes, challenges, and future. Some federal agencies also refer to MD&A as the "overview."

The basic concept that underlies the standards for MD&A is:

> Each general purpose federal financial report (GPFFR) should include a section devoted to management's discussion and analysis (MD&A). It should address the reporting entity's performance measures, financial statements, systems and controls, compliance with laws and regulations, and actions taken or planned to address problems. The discussion and analysis of these subjects may be based partly on information contained in reports other than the GPFFR. MD&A also should address significant events, conditions, trends and contingencies that may affect future operations.

A separate document titled *Concepts for Management's Discussion and Analysis* explains the conceptual basis for the role and importance of MD&A, the general content of the GPFFR, and the elements of MD&A. The concepts provide a foundation for the standards presented in this document. The concepts include suggestions about the contents of MD&A, but those suggestions are not accounting standards or principles for federal reporting entities. In particular, the concepts are not "prescribed guidelines" for required supplementary information as discussed in section 558 of the *Codification of Statements on Auditing Standards* published by the American Institute of Certified Public Accountants (AICPA). The only standards and prescribed guidelines for MD&A are in paragraphs 1-8 of this document.

The standards require MD&A to be included in each GPFFR as required supplementary information (RSI). MD&A should address:

-- the entity's mission and organizational structure;

-- the entity's performance goals and results;

-- the entity's financial statements;

-- the entity's systems, controls, and legal compliance; and

-- the future effects on the entity of existing, currently-known demands, risks, uncertainties, events, conditions and trends.

The discussion and analysis of these subjects may be based on information in other discrete

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_15.pdf.

sections of the GPFFR or it may be based on reports separate from the GPFFR.

The standards are effective for reporting periods that begin after September 30, 1999.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_15.pdf.

MANAGEMENT'S DISCUSSION AND ANALYSIS

STATEMENT OF STANDARDS

1. A report that presents a Federal reporting entity's financial statements in conformance with Federal accounting principles should include management's discussion and analysis (MD&A) of the financial statements and related information. MD&A should provide a clear and concise description of the reporting entity and its mission, activities, program and financial performance, systems, controls, legal compliance, financial position, and financial condition. MD&A should provide a balanced presentation that includes both positive and negative information about these topics. MD&A should be regarded as "required supplementary information" as that term is used in auditing standards.[2]

2. MD&A should contain sections that address the entity's:

- mission and organizational structure;
- performance goals, objectives, and results;
- financial statements; and
- systems, controls, and legal compliance.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_15.pdf.

3. MD&A should include forward-looking information regarding the possible future effects of the most important existing, currently-known demands, risks, uncertainties, events, conditions and trends. MD&A may also include forward-looking information about the possible effects of anticipated future demands, events, conditions, and trends.[1] Forward-looking information may comprise a separate section of MD&A or may be incorporated with the sections listed above.

4. MD&A should discuss important problems that need to be addressed, and actions that have been taken or planned. Actions needed, taken, and planned may be discussed within the sections listed above or in a separate section of MD&A.

5. Because MD&A must be concise if it is to be useful, management must select the most important matters to discuss. This means that some items that are material to the financial statements, notes, and other sections of the GPFFR may not be discussed in MD&A.

6. MD&A should deal with the "vital few" matters; i.e., the most important matters that will probably affect the judgments and decisions of people who rely on the GPFFR as a source of information. (The specific topics mentioned in *Concepts for Management's Discussion and Analysis* are examples of items that might be relevant for MD&A of a given entity.) Matters to be discussed and analyzed are those that management of the reporting entity believes it is reasonable to assume could:

o lead to significant actions or proposals by top management of the

[1]The word "anticipated" is used in a broad, generic sense in this document. In this context the term may encompass both "probable" losses arising from events that have occurred, which should be recognized on the face of the basic or "principal" financial statements, as well as "reasonably possible" losses arising from events that have occurred, which should be disclosed in notes to those statements. "Anticipated" may include the effects of future events that are deemed probable, for which a financial forecast would be appropriate. The term may also encompass hypothetical future trends or events that are not necessarily deemed probable, for which financial projections may be appropriate. Such information about the possible effects of anticipated future demands, events, conditions and trends, if presented, should include the term or label "projected" or "projection," and the key hypothetical underlying assumptions should be explained. As with other information presented in MD&A, no examination of this information by the auditor is now routinely included within the scope of an audit of a federal entity's financial statements; however, preparers and auditors may find useful background information in the AICPA's Statements on Standards for Attestation Engagements Nos. 1 and 4, codified as section 200, "Financial Forecasts and Projections," of the AICPA's *Codification of Statements on Standards for Attestation Engagements.*

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_15.pdf.

reporting unit;

- be significant to the managing, budgeting, and oversight functions of Congress and the Administration; or

- significantly affect the judgment of citizens about the efficiency and effectiveness of their Federal Government.

7. Management of the reporting unit is responsible for the content MD&A.

8. The standards are effective for reporting periods that begin after September 30, 1999.

This Statement of Recommended Standards was adopted unanimously by the eight members of the Federal Accounting Standards Advisory Board serving on the Board in April 1999.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_15.pdf.

4

APPENDIX A: BASIS FOR CONCLUSIONS

Background, Rationale, and Project History

9. The Board identified MD&A as a topic for its agenda shortly after the Board's inception. The Board deferred work on this topic, however, until it completed recommendations for an initial set of basic accounting standards.

10. FASAB published an initial exposure draft on MD&A in January, 1997. It was presented as a statement of recommended concepts rather than standards. The Board proposed that it would deal with MD&A conceptually, with the understanding that OMB would provide authoritative guidance on MD&A to implement the concepts. This approach would have been similar to the one used to deal with the topics of entity and display. The Board dealt with those topics conceptually in SFFAC 2. OMB then provided authoritative guidance in its Bulletin on Form and Content.

11. The Board received comment letters on the initial exposure draft from the following sources:

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_15.pdf.

	FEDERAL (internal)	NONFEDERAL (external)	TOTAL
CITIZENS, USERS, ACADEMICS AND OTHERS[3]		4	4
AUDITORS	7	3	10
PREPARERS AND FINANCIAL MANAGERS	16		16
TOTALS	23	7	30

Concepts and Standards

12. The first exposure draft asked respondents whether all or part of the exposure draft's provisions should be issued as recommended standards rather than recommended concepts. Responses were mixed; most of those who commented on this question favored concepts, but a significant number expressed the view that standards would be appropriate. The Board concluded that, given the importance of MD&A as an integral part of the GPFFR, it would be appropriate for federal accounting principles to include standards for MD&A.

13. At the same time, the Board concluded that MD&A should be treated as required supplementary information. The Board agreed that it would recommend no detailed requirements or guidelines for MD&A at this time, beyond those in paragraphs 1-8. In other words, a discussion and analysis by management that addresses the listed topics should be required, because it is an essential part of a complete GPFFR. At the same time, management should have great discretion regarding what to say about those topics, subject only to the criteria in paragraphs 1-8 and the pervasive requirement that MD&A not be misleading. The standard itself, therefore, is not extremely prescriptive.

14. Because of this change from what was originally exposed for comment, the Board decided to expose separately the proposed standards and concepts for further comment. The exposure drafts were issued in October, 1998; responses were requested by January 1999.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_15.pdf.

The proposed standard, like the final recommended standard, would require the auditor to note the omission of MD&A or the failure to address the specified topics. At the same time, RSI status for MD&A--coupled with the lack of specific, detailed, prescriptive standards for the content of MD&A--would minimize the requirement for the auditor to scrutinize MD&A. This, the Board believed, would provide the flexibility appropriate for dealing with topics such as performance measurement at this point in the evolution of federal financial reporting.

Responses to Second Exposure Draft

15. The Board received comment letters on the second exposure draft from the following sources:

	FEDERAL (internal)	NONFEDERAL (external)	TOTAL
CITIZENS, USERS, ACADEMICS AND OTHERS		3	3
AUDITORS[4]	3	3	6
PREPARERS AND FINANCIAL MANAGERS	11		11
TOTALS	14	6	20

16. Most comments were generally favorable, but comments were mixed regarding some points. A few auditors and preparers expressed some concern about requiring forward-looking information as RSI. Others expressed support for doing so. After considering these responses, the Board agreed to defer the recommended implementation date of the standard by one year and to make minor editorial changes to the standards and concepts that were exposed for comment.

17. Although the resulting standard differs from private sector standards, the Board expects that, in practice, the effect on auditors will not be greatly different.[2] In the private sector, corporations frequently include with their annual financial report the MD&A that they are required to file with the SEC. Because it is required by the SEC rather than by accounting standards, the auditor engaged to audit the corporation's financial statements normally treats MD&A as "accompanying information" that is not audited in the context of the audit of the financial statements. The auditor also may review the submission to the SEC and may have certain responsibilities in that regard, but the auditor's usual role regarding MD&A is, nevertheless, fairly limited.

[2]The standard itself differs from the SEC's guidance for MD&A in ways that reflect the unique federal reporting environment. This will affect what financial statement preparers must do to comply with the standard. For example,

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_15.pdf.

18. Because this standard defines MD&A for federal reporting entities as RSI, auditors will have certain responsibilities regarding it; however, both the accounting standards specified here and the auditing standards specified by the AICPA (and incorporated in Government Audit Standards) for RSI are rather general. Therefore, the Board does not expect that this standard will cause the auditor to be deeply involved in reviewing the contents of MD&A.

19. More specific requirements regarding the content of MD&A may be added later by OMB acting on its own authority or pursuant to future FASAB recommendations. For example, OMB might at some time in the future require preparers to address certain of the suggested items in *Concepts for Management's Discussion and Analysis*. OMB also may provide more specific guidance regarding the auditor's responsibility for MD&A. That guidance may call for more extensive review of all or parts of MD&A than the minimum contemplated by this accounting standard in the context of current auditing standards. For example, OMB might at some time in the future decide that the minimum scope of engagements to audit federal financial statements should be expanded to include a review or examination of all or parts of MD&A, consistent with attestation guidelines published by the AICPA.[3]

Accountability Reports

20. The Board notes that the concept and practice of the "Accountability Report" continue to evolve through the pilot project voluntarily undertaken by several agencies.[5] The Board supports this evolution and encourages agencies to participate in the pilot project. The concepts and standards FASAB recommends are intended to be applicable to the GPFFR of Federal entities, whether those reports are prepared pursuant to the Chief Financial Officers Act, the Government Management Reform Act, or some future law that might establish a statutory basis for Accountability Reports. In the event of such future legislation, OMB will need to resolve any questions about how to apply existing Federal accounting standards in the context of new legislative requirements.

Forward-looking Information

reporting on performance of governmental programs requires measures in addition to net income or net cost.

[3]See Statement on Standards for Attestation Engagements No. 8, *Management's Discussion and Analysis,* issued by the Auditing Standards Board of the AICPA, March 1998.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_15.pdf.

21. MD&A should include forward-looking information regarding the future effects of existing, currently-known demands, risks, uncertainties, events, conditions and trends. This kind of forward-looking information is required when management believes it would be important to people who read the financial report. Though not required, MD&A may also include forward-looking information about the possible effects of anticipated future demands, events, conditions, and trends. FASAB encourages management to include forward-looking information about the possible effects of anticipated future demands, events, conditions, and trends to the extent management believes such information would be useful and relevant. This information can be highly useful, but management should avoid turning this part of MD&A into mere "lobbying" for more budgetary authority.

Incorporation by Reference

22. Some respondents expressed concern that, if MD&A is to be regarded as RSI, audit problems might arise from "incorporation by reference" in MD&A of information drawn from other sources that might not have been subject to audit or review as basic or required supplementary information, and for which authoritative guidance had not been provided by a standard setter. The Board noted that most of those who commented, including most auditors, did not appear to be greatly concerned about this potential problem. The Board concluded, therefore, that any such problems were not likely to be insurmountable. The Board did, however, agree to defer by one year the implementation date of the standard to allow OMB and GAO time to resolve any audit issues that may arise.

[1] The term "general purpose federal financial report," abbreviated GPFFR, is used as a generic term to refer to the report that contains the entity's financial statements that are prepared and audited pursuant to the CFO Act of 1990, as amended. Entities may refer to these reports using different terms, such as "Annual Report," "Accountability Report," "Financial Management Report," etc. Paragraphs 54-112 and Appendix 1 of Statement of Federal Financial Accounting Concepts 2, *Entity and Display*, describe and illustrate the contents of the GPFFR.

[2] See section 558, "Required Supplementary Information," in *Codification of Statements on Auditing Standards*, American Institute of Certified Public Accountants (AICPA).

[3] This category includes representational organizations, retired federal employees, federal employees responding as individuals, and federal contractors, as well as academics and other GPFFR users.

[4] Includes the AICPA's Federal Accounting and Auditing Subcommittee and the Comptroller General's Advisory Council on Government Audit Standards.

[5] Accountability reports are broader in scope than traditional general purpose financial reports. As explained by OMB: "Six pilot agencies volunteered to produce an 'Accountability Report' for FY 1995 to provide more useful

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_15.pdf.

information to decision makers by linking together information required by several management statutes....Accountability Reports integrate the following information: the FMFIA report, the CFOs Act Annual Report (including audited financial statements); management's Report on Final Action as required by the IG Act; Civil Monetary Penalty and Prompt Payment Act reports; and available information on agency performance compared with its stated goals and objectives, in preparation for implementation of GPRA." *Federal Financial Management Status Report and Five Year Plan*, June 1996, pp. 33-34. Twelve agencies produced accountability reports for FY 1997; eighteen plan to do so for FY 1998; the number will increase to 23 for FY 2000. (The requirement to include Civil Monetary Penalty and Prompt Payment Act reports has been deleted.)

THE FEDERAL ACCOUNTING STANDARDS ADVISORY BOARD

The Federal Accounting Standards Advisory Board (FASAB or "the Board") was established in October 1990 by the Secretary of the Treasury, the Director of the Office of Management and Budget (OMB), and the Comptroller General. The nine-member Board was created to consider and recommend accounting principles for the Federal Government.

The Board communicates its recommendations by publishing recommended accounting standards after considering the financial and budgetary information needs of congressional oversight groups, executive agencies, and other users of Federal financial information. The Board also considers comments from the public on its proposed recommendations, which are published for comments as "exposure drafts." The Board's sponsors then decide whether to adopt the recommendations. If they do, the standard is published by OMB and GAO and then becomes effective.

The following documents related to the establishment and mission of the Board are available from the FASAB:

- *"Memorandum of Understanding among the General Accounting Office, the Department of the Treasury, and the Office of Management and Budget, on Federal Government Accounting Standards and a Federal Accounting Standards Advisory Board"*

- *"Mission Statement: Federal Accounting Standards Advisory Board"*

EXECUTIVE SUMMARY

a The purpose of this Statement is to amend certain standards for heritage assets in Statement of Federal Financial Accounting Standards No. 6, Accounting for Property, Plant, and Equipment, (SFFAS No. 6), which was issued in November 1995; and, Statement of Federal Financial Accounting Standards No. 8, Supplementary Stewardship Reporting, (SFFAS No. 8), which was issued in June 1996. Specifically, the amendments affect accounting and reporting standards for heritage assets that serve a dual purpose; that is, heritage assets that 1) have a heritage characteristic, and 2) are used in general government operations.

b In SFFAS No. 6 and SFFAS No. 8, these heritage assets were referred to as "multi-use heritage assets." To clarify the meaning of the term "multi-use heritage assets," the amendments define "multi-use heritage assets" as being heritage assets whose predominant use is general government operations. Heritage assets having incidental use in general government operations are not referred to as "multi-use heritage assets.' Rather, they are simply "heritage assets."

c In addition, the original standards required the cost of multi-use heritage assets that did not directly relate to operations be accounted for as an expense, while costs that directly support operations be accounted for as general property, plant, and equipment (PP&E). This treatment would have resulted in inconsistent cost measures between agencies using heritage office buildings and those using non-heritage office buildings.

d To alleviate this inconsistency, the Board decided that ~~the~~ all acquisition, reconstruction, and betterment costs of multi-use heritage assets (i.e., heritage assets whose predominant use is general government operations) be capitalized as general PP&E and depreciated over their service life. This amendment should result in consistent accounting for the cost of PP&E predominantly used in general government operations.

INTRODUCTION

Purpose

1 The purpose of this Statement is to amend certain standards contained in Statement of Federal Financial Accounting Standards Number 6 (SFFAS No. 6), Accounting for Property, Plant, and Equipment, and Statement of Federal Financial Accounting Standards Number 8 (SFFAS No. 8), Supplementary Stewardship Reporting.

Scope

2 This Statement specifically affects the accounting standards for heritage assets in SFFAS No. 6, paragraphs 59 and 60 through 63, and SFFAS No. 8, paragraphs 48 through 50.

Effective date

3 The amending accounting standards in this statement are effective for periods beginning after September 30, 1999, with earlier implementation encouraged.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_16.pdf.

This page intentionally blank

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_16.pdf.

AMENDMENTS TO SFFAS No. 6

Introduction

4 Accounting standards for multi-use heritage assets are presented in paragraphs 5 through 15 that follow. The standards presented in these paragraphs supersede designated paragraphs in SFFAS No. 6 as they relate to multi-use heritage assets. Other paragraphs in SFFAS No. 6, which are not amended by this document or by Statement 11, remain in effect.

Heritage Assets

5 Heritage assets are defined in paragraphs 57 and 58 in SFFAS No. 6. Those paragraphs are not changed. However, accounting for "multi-use heritage assets" is changed. The new provision is provided in paragraph 6 below, which replaces paragraph 59 of SFFAS No. 6.

6 Heritage assets may in some cases be used to serve two purposes--a heritage function and general government operations. In cases where a heritage asset serves two purposes, the heritage asset shall be considered a multi-use heritage asset if the predominant use of the asset is in general government operations (e.g., the main Treasury building which is a heritage asset used as an office building). The cost of acquisition, betterment, or reconstruction of all multi-use heritage assets shall be capitalized as general PP&E and depreciated.

RECOGNITION AND MEASUREMENT

7 Paragraphs 8 through 12 below replace paragraphs 60 through 62 of SFFAS No. 6.

8 The cost of acquiring, improving, reconstructing, or renovating heritage assets, other than multi-use heritage assets, shall be recognized on the statement of net cost for the period in which the cost is

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_16.pdf.

incurred. The cost[1] shall include all costs incurred during the period to bring the item to its current condition at its initial location (See paragraph 26 of SFFAS No. 6 for examples of the costs to be considered).

9 The cost of acquisition, betterment, or reconstruction of multi-use heritage assets shall be capitalized as general PP&E and depreciated, with an appropriate footnote disclosure explaining that "physical quantity" information for the multi-use heritage assets is included in supplemental stewardship reporting for heritage assets. The multi-use heritage assets shall be depreciated over their useful life.

10 With the exception of multi-use heritage assets, as stated in paragraph 11 below, no amounts for heritage assets acquired through donation or devise[2] shall be recognized in the cost of heritage assets. The assets' fair value, if known and material, shall be disclosed in notes to the financial statements in the year received. If fair value is not known or reasonably estimable, information related to the type and quantity of heritage assets received shall be disclosed.

11 Multi-use heritage assets acquired through donation or devise shall be recognized as general PP&E at the assets' fair value, and the amount shall also be recognized as "nonexchange revenues" as defined in SFFAS No. 7, Accounting for Revenue and Other Financing Sources.

[1] For a full discussion of cost, including full cost, direct cost and indirect cost, see SFFAS No. 4, *Managerial Cost Accounting Concepts and Standards for the Federal Government* (June 1995). Also, see pars. 94-95, Statement of Federal Financial Accounting Concepts No. 2, *Entity and Display*.

[2] A will or clause of a will disposing of property.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_16.pdf.

12 Additional reporting requirements are provided in SFFAS No. 8, *Supplementary Stewardship Reporting*.

IMPLEMENTATION GUIDANCE

13 Paragraph 14 below replaces paragraph 63 of SFFAS No. 6. Paragraph 15 provides additional guidance on multi-use heritage assets. (Paragraphs 64 and 65 of SFFAS No. 6 remain in effect.)

14 Heritage assets (excluding multi-use heritage assets) previously recognized as assets for balance sheet reporting and their related contra amounts (e.g. accumulated depreciation) shall be removed from the balance sheet and charged to the net position of the entity. The amount of the adjustment shall be reported as a "prior period adjustment" in the statement of changes in net position.

15 Implementation guidance for general PP&E, in paragraph 40 through 44, SFFAS No. 6, is applicable to multi-use heritage assets. Entities that implemented the multi-use heritage asset standard in SFFAS No. 8 in prior years for stewardship assets, will need to capitalize those amounts upon implementation of this amendment. That amount shall be added to the balance sheet and reported as a "prior period adjustment" in the statement of changes in net position.[3]

This page intentionally blank

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_16.pdf.

AMENDMENTS TO SFFAS No. 8

Introduction

16 Accounting standards for multi-use heritage assets are presented in paragraphs 17 and 18 that follow. The standards presented in these paragraphs supersede designated paragraphs in SFFAS No. 8 as they relate to multi-use heritage assets. Other paragraphs in SFFAS No. 8, which are not amended by this document, remain in effect.

Heritage Assets

17 Paragraphs 48 and 49 in SFFAS No. 8 are rescinded. The reader should refer to paragraphs 6 through 15 in this document for guidance on multi-use heritage assets. Paragraph 18, which is presented below, is added as a reporting requirement in paragraph 50 of the Heritage Assets **Minimum Reporting** requirements in SFFAS No. 8. Other paragraphs on heritage assets in SFFAS No. 8 remain in effect.

18 A footnote shall explain that financial information for multi-use heritage assets is presented in the principal statements.

The provisions of this statement need not be applied to immaterial items.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_16.pdf.

This page intentionally blank

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_16.pdf.

APPENDIX A: BASIS FOR CONCLUSIONS

19 This appendix summarizes the Board's considerations in recommending modifications to amend SFFAS No. 6, *Accounting for Property, Plant, and Equipment*, and SFFAS No. 8, *Supplementary Stewardship Reporting*, as they relate to heritage assets.

MULTI-USE HERITAGE ASSETS

Background

20 In the original PP&E Exposure Draft (February 1995), renovation, improvements, restoration or reconstruction costs for that portion of the heritage asset used in general government operations were to be capitalized and depreciated. Meanwhile, the costs that primarily related to the preservation of the asset for a heritage purpose (e.g., excess cost of maintaining original design and construction materials) rather than general government operations were to be excluded from general PP&E (i.e., expensed in the period incurred). The response to this proposal contained in the ED was that costs could not be divided between heritage and general PP&E in this manner.

21 In the existing standards (SFFAS No. 6 and No. 8), costs of renovation, improvement, restoration, or reconstruction that can be directly related to government operations (e.g., modification or improvement of office space, upgrading of electrical or communication equipment/wiring) are to be capitalized and depreciated. Meanwhile, the costs to renovate, restore, or reconstruct the heritage asset itself (the shell) were to be excluded from general PP&E (i.e., expensed in the period incurred). Again, comments the Board received pertaining to implementing this requirement were that the distinction for the costs cannot be made and that it produces inconsistent results.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_16.pdf.

Exposure Draft

22 In February 1998, the Board issued an exposure draft (ED), *Amendments to Accounting for Property, Plant, and Equipment*, proposing amendments to SFFAS No. 6 and No. 8. In the proposed amendments, the costs of acquisition, betterment, or reconstruction of multi-use heritage assets (i.e., heritage assets used in general government operations) were to be treated as general PP&E and depreciated. The Board believes that this treatment would be consistent with the full cost standards, eliminate the need to adjust cost amounts presented in the government-wide consolidated financial statements, and be consistent with the predominant use notion.

23 The proposed modification for multi-use heritage assets is based on various entities' accounting for and reporting on multi-use heritage assets. The current accounting standards created inconsistent treatment of assets that were ultimately used in the same ways. For example, because the general PP&E category includes all PP&E used in a business-type activity, the General Services Administration (GSA) will capitalize the full cost of its buildings because they are used in business. Meanwhile, entities performing non-business-type entities (i.e., providing a service without receiving value in return) will not show the full costs of their building because of its multi-use heritage asset status. This is inconsistent accounting that is not justified by the uses of the assets.

24 The Board found that consolidation of entities accounting for similar assets differently also could add unnecessary complexity to the consolidation process. Since a monumental office building accounted for by GSA as general PP&E and entirely capitalized by GSA becomes a multi-use heritage asset at the government-wide level the asset, cost of heritage assets, and depreciation expense amounts would have to be adjusted on consolidation (subject to materiality limitations). The Board believes that this change to the accounting for multi-use heritage assets will also correct this unnecessary complexity.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_16.pdf.

Responses to ED

25 Thirty written responses were received in regard to the ED. Of the thirty responses received, fifteen respondents commented on the proposed amendments for multi-use heritage assets. Thirteen of the respondents who commented on the proposed amendments for multi-use heritage assets agreed with the proposed amendments, while the other 2 respondents who commented on them disagreed.

Board Decisions

26 To allow for full costing on assets used in general government operations, the Board believes that the costs of acquisition, betterment, or reconstruction of multi-use heritage assets should be capitalized and depreciated to allow for full costing in accordance with SFFAS No. 4, *Managerial Cost Accounting Concepts and Standards for the Federal Government.* Thus, the Board decided to capitalize and depreciate multi-use heritage assets and allocate the depreciation based on function.

27 Some respondents to the ED asked if multi-use heritage assets reported as general PP&E on the balance sheet should also be reported in supplemental stewardship reporting, in order to recognize them as heritage assets. It was observed by the Board that it would be desirable to report all material heritage assets in stewardship reporting, including those multi-use heritage assets reported on the balance sheet, to show a complete picture for stewardship purposes of all material assets classified as heritage assets. This is consistent with the Board's decision in SFFAS No. 8 to specifically note that some land might be included in heritage assets and in stewardship land. Different information is captured under the reporting for each category.

28 This dual reporting of multi-use heritage assets is highlighted through note disclosures directing readers from the balance sheet to the stewardship reports and vice versa. The amended standards require balance sheets to have a note disclosure which

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_16.pdf.

explains that "physical quantity" information for the multi-use heritage assets is included in supplemental stewardship reporting for heritage assets. In addition, for multi-use heritage assets reported in stewardship reporting, an appropriate note disclosure is required to explain that financial information for multi-use heritage assets is presented in the principal statements.

29 The ED also added the predominant use notion for multi-use heritage assets because the Board agreed that incidental office use should not determine the accounting treatment; that the predominant use should prevail. An example of incidental office use would be administrative offices or shop space in the Jefferson Memorial. In this case both uses are incidental and the Jefferson Memorial should be treated as a heritage asset and not be capitalized and depreciated.

30 One respondent to the ED suggested that "predominant use" be defined in the standard. During its deliberations, however, the Board noted that the terminology "predominant use" is already used in SFFAS No. 8 without any questions or problems being raised about its definition. Therefore, the Board believed that if it did define the term, that action may create a problem where no problem exists.

Board Approval

31 The Board approved this recommendation by a vote of 8 members approving its issuance and 0 member(s) opposing its issuance. Although the Board is comprised of 9 members, only 8 members cast a vote on SRAS 16. This is because the term of one Board member had expired and the appointment of a successor had not been finalized.

APPENDIX C: GLOSSARY

BETTERMENT - An expenditure having the effect of extending the useful life of an existing asset, increasing its normal rate of output, lowering its operating cost, increasing rather than merely maintaining its efficiency or otherwise adding to the worth of benefits it can yield. A betterment is distinguished from repair or maintenance in that the latter have the effect of merely keeping the asset in its customary state of operating efficiency without the expectation of added future benefits. (*Kohler's Dictionary for Accountants*.)

CAPITALIZE - To record and carry forward into one or more future periods any expenditure the benefits or process from which will then be realized. (*Kohler's Dictionary for Accountants*)

CONDITION - The physical state of an asset. The condition of an asset is based on an evaluation of the physical status/state of an asset, its ability to perform as planned, and its continued usefulness. Evaluating an asset's condition requires knowledge of the asset, its performance capacity and its actual ability to perform, and expectations for its continued performance. The condition of a long-lived asset is affected by its durability, the quality of its design and construction, its use, the adequacy of maintenance that has been performed, and many other factors, including: accidents (an unforeseen and unplanned or unexpected event or circumstance), catastrophes (a momentous tragic event ranging from extreme misfortune to utter ruin), disasters (a sudden calamitous event bringing great damage, loss, or destruction), and obsolescence.

COST - Defined in SFFAC No. 1, *Objectives of Federal Financial Reporting* as the monetary value of resources used (para. 195). Defined more specifically in SFFAS No. 4, *Managerial Cost Accounting Concepts and Standards for the Federal Government*, as the monetary value of resources used or sacrificed or liabilities incurred to achieve an objective, such as to acquire or produce a good or to perform an activity or service (page 105). Depending on the nature of the transaction, cost may be charged to operations immediately, i.e., recognized as an expense of the period, or to an asset account for recognition as an expense of subsequent periods. In most contexts within *Accounting for Revenue and Other Financing Sources*, "cost" is used synonymously with expense. See also "Full Cost."

DIRECT COST - The cost of resources directly consumed by an activity, and is specifically identified with a cost object. Direct costs are assigned to activities by direct tracing of units of resources consumed by individual activities.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_16.pdf.

EXPENDITURE - With respect to provisions of the Antideficiency Act (31 U.S.C. 1513-1514) and the Congressional Budget and Impoundment Control Act of 1974 (2 U.S.C.622(i)), a term that has the same definition as outlay. (GAO *Budget Glossary*)

FAIR VALUE (Or fair market value) - Value determined by bona fide bargain between well-informed buyers and sellers, usually over a period of time; the price for which an PP&E item can be bought or sold in an arm's length transaction between unrelated parties; value in a sale between a willing buyer and a willing seller, other than in a forced or liquidation sale; an estimate of such value in the absence of sales or quotations. (*Kohler's Dictionary for Accountants*)

FULL COST - The total amount of resources used to produce the output. More specifically, the full cost of an output produced by a responsibility segment is the sum of (1) the costs of resources consumed by the responsibility segment that directly or indirectly contribute to the output, and (2) the costs of identifiable supporting services provided by other responsibility segments within the reporting entity and by other reporting entities. (SFFAS No. 4, *Managerial Cost Accounting Concepts and Standards for the Federal Government*, para. 89) All direct and indirect costs to any part of the Federal Government of providing goods, resources, or services. (OMB *Circular A-25*).

GENERAL PROPERTY, PLANT, AND EQUIPMENT (PP&E) - PP&E used to provide government services or goods. The cost of general PP&E is capitalized, i. e. recorded as an asset on the balance sheet. For detailed characteristics of and accounting for general PP&E, see paragraphs 23 through 34, SFFAS No. 6.

HERITAGE ASSETS - Property, plant, and equipment that are unique for one or more of the following reasons: historical or natural significance; cultural, educational or artistic (e.g., aesthetic) importance; or, significant architectural characteristics.

INDIRECT COST - A cost that cannot be identified specifically with or traced to a given cost object in an economically feasible way.

MULTI-USE HERITAGE ASSETS - Heritage assets whose predominant use is general government operations.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_16.pdf.

RECOGNITION (OR RECOGNIZE) - The term recognition, as used in this Statement, bears the same meaning as used by the Financial Accounting Standards Board in its conceptual statements. Recognition is the process of formally recording or incorporating an item into the financial statements of an entity as an asset, liability, revenue, expense, or the like. A recognized item is depicted in both words and numbers, with the amount included in the statement totals. Recognition comprehends both initial recognition of an item and recognition of subsequent changes in or removal of a previously recognized item. (Financial Accounting Standards Board, Statement of Financial Accounting Concepts No. 5, *A Replacement of FASB Concepts Statement No. 3,* para. 6.)

STEWARDSHIP - The Federal Government's responsibility for the general welfare of the nation in perpetuity.

USEFUL LIFE - The normal operating life in terms of utility to the owner.

THE FEDERAL ACCOUNTING STANDARDS ADVISORY BOARD

The Federal Accounting Standards Advisory Board (FASAB or "the Board") was established in October 1990 by the Secretary of the Treasury, the Director of the Office of Management and Budget (OMB), and the Comptroller General. The nine-member Board was created to consider and recommend accounting principles for the Federal Government.

The Board communicates its recommendations by publishing recommended accounting standards after considering the financial and budgetary information needs of congressional oversight groups, executive agencies, and other users of federal financial information. The Board also considers comments from the public on its proposed recommendations, which are published for comment as "exposure drafts." After considering oral and written comments, the standards may be recommended by the Board. The Board's sponsors then decide whether to adopt the recommendations. If adopted, the standards are published by OMB and the General Accounting Office (GAO), and become authoritative.

The following documents related to the establishment and mission of the Board are available from the FASAB:

- *"Memorandum of Understanding among the General Accounting Office, partment of the Treasury, and the Office of Management and Budget, on Federal ıment Accounting Standards and a Federal Accounting Standards Advisory Board"*

- *"Mission Statement: Federal Accounting Standards Advisory Board"*

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

EXECUTIVE SUMMARY

I. This statement presents accounting standards for federal social insurance programs. The standards cover the following programs: Social Security (Old-Age, Survivors, and Disability Insurance), Medicare (Hospital Insurance [Part A] and Supplementary Medical Insurance [Part B]), Railroad Retirement benefits, Black Lung benefits, and Unemployment Insurance. The standards do not cover any other programs at this time.

II. Social insurance programs have complex characteristics and thus require specialized accounting standards. These programs blend elements of exchange and nonexchange transactions and therefore do not completely fit traditional accounting notions of either annual governmental assistance programs (nonexchange transactions) or long-term pension programs (exchange transactions).

III. Because taxpayers rely on social insurance programs in their long-term planning, fundamental questions about social insurance programs include (1) whether they are sustainable as currently constructed and (2) what their effect on the government's financial condition will be. The requirements of this standard reflect the complexity of these programs. In its entirety, the information required will help users assess the government's financial condition and the sufficiency of future budgetary resources for these programs. No single element of the information required is sufficient to meet all the users' needs.

IV. The standards require that a liability be recognized when payments are due and payable to beneficiaries or service providers. Supplementary stewardship information is to be reported to facilitate assessing the program's long-term sustainability and the ability of the program and the nation to raise resources from future program participants to pay for benefits proposed to present participants.

V. The supplementary stewardship information is required in the financial reports of both the individual agency and the governmentwide entity. The information is tailored for specific programs but generally includes narrative and/or graphic presentation of the following:

(1) long-range cashflow projections in nominal dollars and as a percentage of (a) the payroll that is subject to the tax earmarked for the program and (b) the Gross Domestic Product;

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

(2) long-range projection of the ratio of contributors to beneficiaries (commonly called the "dependency ratio"); and

(3) a statement presenting the actuarial present values of (i) future benefits and (ii) contributions and tax income for social insurance programs.

VI. Although some RSSI is required for all programs, the differences in financing and benefits among programs require some tailoring of the RSSI. The standards also address the governmentwide entity where the RSSI necessarily must be presented at a more summarized level than at the agency level.

VII. The Board is issuing this statement after years of debate. Taken as a whole, the package of disclosures is a major step forward in meeting the objectives of federal financial reporting. Nonetheless, federal financial reporting is in a period of great change and the Board expects that further research regarding presentation of a federal balance sheet is needed. In Statement of Federal Financial Accounting Concepts No. 1, *Objectives of Federal Financial Reporting*, the Board acknowledged that an evolutionary approach would be taken:

> The FASAB recognizes that developing and implementing standards that will contribute to achieving certain objectives may take considerable time. Time will be needed to establish information-gathering systems and to gain experience by experimenting with alternative approaches. [par. 35]
>
> The FASAB expects that some of these objectives may best be accomplished through means of reporting outside general purpose financial reports. Indeed, the FASAB recognizes that information sources other than financial reporting, sources over which the FASAB may have little of no influence, also are important to achieving the goals implied by these objectives. [par. 36]

Introduction
1

PURPOSE 1. The purpose of this statement is to establish standards for reporting information on social insurance programs that will assist users in evaluating operations and aid in assessing the government's financial condition and the sufficiency of future budgetary resources to sustain program services and meet program obligations as they come due. Social insurance programs were studied and analyzed during the Board's work on Statements of Federal Financial Accounting Standards (SFFAS) No. 5, *Accounting for Liabilities of the Federal Government*, and No. 8, *Supplementary Stewardship Reporting*. However, the Board decided to address the subject in a separate project.

SCOPE 2. This statement establishes accounting standards to be used by component entities and by the governmentwide entity for the following federal programs: Old-Age, Survivors, and Disability Insurance (OASDI or "Social Security"), **Medicare** [1] Hospital Insurance (HI), Medicare Supplementary Medical Insurance (SMI), **Railroad Retirement** benefits, **Black Lung** benefits, and **Unemployment Insurance** (UI) for the general public. Accounting standards for UI for federal employees are provided in Statement of Federal Financial Accounting Standards No. 5 and are not within the scope of this statement. This statement should be applied only to programs listed in paragraph 14.

BACKGROUND

3. As noted in FASAB's Statement of Federal Financial Accounting Concepts (SFFAC) No. 1, *Objectives of Federal Financial Reporting* (*Objectives*), the Federal Government is unique when compared with any other entity in the country. It is the vehicle that citizens of the United States use to exercise their sovereign power. It has continuing responsibility for the general welfare. It also has unique access to financial resources in that it has the power to tax, to borrow, and to create money.

4. As a result of these responsibilities, the Federal Government engages in many activities that have no counterpart or that are a relatively small part of the activities in the private sector. The government is concerned, for example, with macroeconomic policies to maintain incomes during recessions and therefore provides unemployment compensation and other benefits. It is concerned with the distribution of income and therefore (1) provides a wide variety of welfare payments in cash and in kind to low-income households and (2) makes taxes and many kinds of benefits "progressive." It

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

is concerned about conditions and services in certain regions and communities, urban and rural, and therefore provides grants to state and local governments for various purposes. The fiscal year 2000 Budget of the United States reports that Social Security, Medicare, and other health and income security payments for individuals constituted more than 50 percent of the federal budget; grants to state and local governments comprised 15 percent.

5. In *Objectives*, the Board established four major reporting objectives around which accounting standards should be organized. Taken together, they provide a framework for assessing the existing accountability and financial reporting systems of the Federal Government and for considering how new accounting standards might enhance those systems.[1] The four objectives are

    1. Budgetary Integrity,
    2. Operating Performance,
    3. Stewardship, and
    4. Systems and Controls.

6. Although all the objectives are important, Nos. 2 and 3 directly impact the social insurance standards. Objective No. 2 provides,

> Federal financial reporting should assist report users in evaluating the service efforts, costs, and accomplishments of the reporting entity; the manner in which these efforts and accomplishments have been financed; and the management of the entity's assets and liabilities.[2]

As noted in *Objectives,* because government services are not usually provided in exchange for voluntary payments or fees, expenses cannot be matched against revenue to measure "net income." Moreover, directly measuring the value added to society's welfare by government actions is difficult. Nonetheless, expenses can be matched against the provision of services year by year. The resulting cost can then be analyzed in relation to a variety of measures of the achievement of results. Information about social insurance that is relevant to this objective includes the cost of the program as well as long-range estimates (and ranges of estimates) of future costs

[1] SFFAC No. 1, par. 109.
[2] SFFAC No. 1, par. 122.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

and other obligations. Estimates of future costs highlight the cost impact of changes in benefit levels as well as economic and demographic changes (e.g., in the cost of health care and in life expectancies).

7. Meeting Objective No. 3 is the other focus for this statement. It says,

> Federal financial reporting should assist report users in assessing the impact on the country of the government's operations and investments for the period and how, as a result, the government's and the nation's financial condition has changed and may change in the future.[3]

This objective is based on the government's responsibility for the general welfare of he nation in perpetuity. It focuses not on the provision of specific services but on the requirement that the government report the broad outcomes of its actions. Thus, federal financial reporting should provide information that helps the reader to determine

- whether the government's financial position improved or deteriorated over the period,
- whether future budgetary resources will likely be sufficient to sustain public services and to meet obligations as they come due, and
- whether government operations have contributed to the nation's current and future well-being.

8. In light of Objective Nos. 2 and 3, fundamental questions about social insurance programs that can be addressed by accounting standards include whether the programs are sustainable as currently constructed, whether the government's financial condition improved or deteriorated as a result of its efforts to provide these and other programs, and the likelihood that these programs will be able to provide benefits at current levels to those who are planning on receiving them. The information required by this standard, taken as a whole, will help users make this assessment while acknowledging the complexity of the programs and the uncertainty of long-term projections.

[3] SFFAC No. 1, par. 134.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

9. To meet the objectives of federal financial reporting, the standards require that:

   (1) a liability be **recognized**[4] when payments are due and payable to beneficiaries or service providers and

   (2) supplementary stewardship information be reported to facilitate the assessment of:

      (i) the long-term sustainability of the program from both an entity and a governmentwide perspective and

      (ii) the ability of the program and the nation to raise resources from future program participants to pay for benefits proposed to present participants.

10. The RSSI includes:

   - long-range cashflow projections,
   - long-range projections of the ratio between the number of those paying taxes earmarked for the program and the number of program beneficiaries, and
   - actuarial present values of (i) future benefits for and (ii) contributions and tax income from or on behalf of current and future program participants.

11. The specification of RSSI by the Board should not be construed as precluding management from voluntarily providing any additional information pertaining to the financial condition of its program that it believes useful and appropriate.

MATERIALITY

[4] The terms "recognition," "disclosure," and "required supplementary stewardship information" (RSSI) have specific, technical application in accounting. As explained further in the glossary to this statement, "recognition" (or "recognize") means formally recording or incorporating an item into the financial statements of an entity as an asset, liability, revenue, expense, etc. "Disclosure" (or "disclose") means reporting information in notes or narrative regarded as an integral part of the basic financial statements. RSSI is information reported outside the principal financial statements that the Board considers essential to an entity's financial reporting and therefore recommends authoritative guidelines for its measurement and presentation.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

12. The provisions of the accounting standards in this statement need not be applied to mmaterial items.

EFFECTIVE DATE

13. The provisions of this statement would be effective for reporting periods that begin after September 30, 1999.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

ACCOUNTING STANDARDS FOR SOCIAL INSURANCE

14. The following programs are designated as social insurance and subject to these standards:

- Old-Age, Survivors, and Disability Insurance (OASDI or "Social Security");
- Hospital Insurance (HI) and Supplementary Medical Insurance (SMI), known collectively as "Medicare";
- Railroad Retirement benefits;
- Black Lung benefits; and
- Unemployment Insurance (UI).

No other programs are subject to these standards, and the characteristics presented below should not be used to include other programs.

Characteristics of Social Insurance Programs

15. These programs were developed to carry out the responsibilities of the government and generally have characteristics that make them unique. Although they generally share certain characteristics, "social insurance" programs are too diverse to allow definitive criteria to be applied to include some and exclude others from the category. This statement identifies the following five characteristics common among social insurance programs:

(1) Financing from participants or their employers,

(2) Eligibility from taxes/fees paid and time worked in **covered employment**,

(3) Benefits not directly related to taxes/fees paid,

(4) Benefits prescribed in law, and

(5) Programs intended for the general public.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

These characteristics are briefly described below.

Financing From Participants

16. Some of the resources needed to run these programs are raised through explicit taxes and fees collected from the program participant or from the participant's employer. Taxes paid are usually a fixed percentage of the participant's wage income.

17. Federal social insurance programs utilize "trust funds" to account for dedicated collections held for later use to accomplish the program's purpose. Federal **trust funds** are accounts designated by law as such for receipts earmarked for specific purposes and the associated expenditure of those receipts. Trust funds serve useful purposes in allocating federal spending authority and accounting for earmarked taxes.

Eligibility from Taxes/Fees Paid and Time Worked in Covered Employment

18. Eligibility for benefits under social insurance programs usually rests, in part, on current or previous taxes and/or fees paid by the individual, the individual's employer, or both, and the time worked in covered employment. Frequently an individual's taxes and/or fees paid and time worked in covered employment also make family members eligible.

Benefits Not Directly Related to Taxes/Fees Paid

19. Social insurance programs sometimes intentionally redistribute toward lower-wage workers. Lower-wage workers tend to receive proportionately more in benefits relative to taxes paid than the higher-wage workers, sometimes much more. Many social insurance plans also subsidize benefits for nonworking members of workers' families and others.

Benefits Prescribed in Law

20. Social insurance programs normally have uniform sets of entitling events; and

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

schedules of benefits are developed, announced, and applied to all participants. Administrators of such programs have little discretion in determining who should get benefits or how much they should get.

Intended for the General Public

21. These programs are intended for the general public and not solely for present or former federal employees.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

COMPONENT ENTITY ACCOUNTING & REPORTING STANDARD

Expense & Liability Recognition

22. The expense recognized for the reporting period should be the benefits paid during the reporting period plus any increase (or less any decrease) in the liability from the end of the prior period to the end of the current period. The liability should be social insurance benefits due and payable to or on behalf of beneficiaries at the end of the reporting period, including claims incurred but not reported (IBNR).

23. For Unemployment Insurance (UI), the liability to be recognized includes (1) amounts due to states and territories for benefits they have paid to beneficiaries but for which they have not withdrawn funds from the federal unemployment trust fund (UTF) as of fiscal year end, and (2) estimated amounts to be withdrawn from UTF and benefits paid by states and territories after fiscal year end for compensable days occurring prior to fiscal year end.

Required Supplementary Stewardship Information

24. The entity responsible for the social insurance program should include in its financial report, as **required supplementary stewardship information** (RSSI), a clear and concise description of the program, how it is financed, how benefits are calculated, and its financial and actuarial status. The description should include a discussion of the long-term sustainability and financial condition of the program. A display should illustrate and the discussion should explain the trends revealed in the data. The entity should consider both narrative and graphic presentations. Statutory or other material changes affecting the program after the current fiscal year, including those enacted between the fiscal year end and the date of the report, should be described, along with the implications thereof.

25. The projections and estimates used should be based on the entity's best estimates of demographic and economic **assumptions**, taking each factor individually and incorporating future changes mandated by current law. Significant assumptions should be disclosed.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

26. All projections and estimates required in these standards should be made as of a date (the valuation date) as close to the end of the fiscal year being reported upon ("current year") as possible and no more than one year prior to the end of the current year. This valuation date should be consistently followed from year to year.

27. The information on financial and actuarial status should include the following measures and data:

(1) *Cashflow Projections* - Projections of cashflow for those persons who are participating or eventually will participate in the program as contributors or beneficiaries during a projection period sufficient to illustrate long-term sustainability (e.g., traditionally the "Social Security," or OASDI, program has used a projection period of 10 years for relatively short-term and 75 years for long-term projections, and the UI program has used a projection period of 10 years for its projections). The projection should include current workers, retirees, survivors, disabled persons, and new participants entering the workforce or becoming beneficiaries, including those who will be born or immigrate to the United States during the projection period. The information should include the following:

(a) Actuarial projections of the annual cashflow, in nominal dollars, with amounts reported for at least every fifth year in the projection period. The cashflow information should show

(i) total cash inflow from:

1) all sources and
2) excluding net interest on intragovernmental borrowing/lending,[2] and

(ii) total cash outflow.

The narrative accompanying the cashflow data should include identification of any year or years during the projection period when cash outflow exceeds inflow, both in total and excluding interest on intragovernmental

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

borrowing/lending (the "cross-over points"), and an explanation of the significance of the "cross-over points.

(b) The actuarial estimate provided in 27(1)(a)(i)2) and 27(1)(a)(ii) immediately above as a percentage of

(i) **taxable payroll**[5] and
(ii) **Gross Domestic Product** (GDP).[6]

(2) *Ratio of Contributors to Beneficiaries* - With respect to the OASDI and HI programs, the ratio of the number of contributors to the number of beneficiaries (commonly called the "dependency ratio") during the same projection period as for cashflow projections (e.g., 75 years), using the program managers' best estimate.[7] At a minimum, the ratio should be reported for the beginning and end of the projection period.

(3) *Actuarial Present Values* - For all programs except UI, a statement presenting the actuarial present value of each of the following:

All future expenditures during the projection period related to benefit payments:

(a) to or on behalf of current participants who have not yet attained retirement age (e.g., the Social Security Administration has assumed an age of 15 years for new participants and an age of 62 years for retirement),

(b) to or on behalf of current participants who have attained retirement age,

[5] Certain social insurance programs (i. e., SMI , Black Lung benefits, and UI) are either not financed by earmarked payroll taxes or are financed by state-determined payroll taxes on employers that can vary by state and by employer; therefore these programs are not required to provide this estimate.

[6] This requirement does not apply to the RRB, Black Lung, and UI programs.

[7] SMI, Black Lung benefits, and UI programs are financed by, respectively, premiums paid by covered participants and general fund contributions (SMI); direct payments from employers, excise taxes per ton of coal, and general fund contributions (Black Lung); and state/employer-specific payroll taxes (UI). Therefore, these programs are not required to provide the ratio of contributors to beneficiaries. The OASDI trustees refer to the ratio of beneficiaries to contributors as the "dependency ratio."

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

(c) to or on behalf of those who are expected to become plan participants (i.e., new entrants) during a projection period encompassing substantially all the present value attributed to (a) and (b) immediately above;[8]

All future contributions and tax income (from taxation of benefits) during the projection period:

(d) from or on behalf of current participants who have not yet attained retirement age (same group as in (a) above),

(e) from or on behalf of current participants who have attained retirement age (same group as in (b) above),

(f) from or on behalf of those who are expected to become plan participants (same group as in (c) above) during a projection period encompassing substantially all the present value attributed to (d) and (e) immediately above.

Net present value of cashflow during the projection period:

(g) the actuarial present value of future contributions and tax income during the projection period [(d)+(e)+(f)] should be subtracted from the actuarial present value of future expenditures for the projection period related to benefit payments [(a)+(b)+(c)] to derive a total excess of future benefit payments over future contributions and tax income (or contributions and tax income over benefits).

Notes to the statement should present:

[8] A projection period for ***future*** participants would cover their working and retirement years. The entity would make an assumption about the length of this period. For example, the OASDI program uses a projection period of 75 years. A projection period for ***current*** participants (that is, for the people actually participating in the program) would theoretically cover all of their working and retirement years, a projection period that could be greater than 75 years a in few instances. As a practical matter the present values of future payments and contributions for/from current participants beyond 75 years usually would not be material, and a 75 year projection period would include virtually all the future contributions, tax income, and benefit payments for current as well as future participants.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

(h) the accumulated excess of all past cash receipts, including interest on investments, over all past cash disbursements within the social insurance program represented by the fund balance at the valuation date, and

(i) a statement that the actuarial net present value of the excess of future expenditures related to benefit payments to or on behalf of current participants, that is, of the "closed group" of participants (see (a) and (b) above), over future contributions and tax income from them or paid on their behalf (see (d) and (e) above) is calculated by subtracting the actuarial present value of future contributions and tax income paid by and for current participants [(d)+(e)] from the actuarial present value of the future benefit payments to them or on their behalf [(a)+(b)].

(j) information required in subparagraphs 27(3)(a)-(h) for the current year and separate estimates for each of the four preceding years.

(4) *Sensitivity Analysis* -

(a) For all programs except UI illustrate the sensitivity of the projections and present values required by paragraphs 27 (1) and 27(3) to changes in the most significant individual assumptions. For example, using the entity's "best estimate" cost assumptions as a baseline, show the effect of varying several significant assumptions one at a time to show the effect on the projection. At a minimum the OASDI and Medicare programs should analyze assumptions regarding the birth and death rates, net immigration, the real wage differential, and the real interest rate. The real-wage differential is the difference between the annual percentage increase in wages in covered employment and the inflation rate, as measured by the CPI. The Medicare program should also analyze the health care cost factors and their trend.

(b) For UI illustrate the sensitivity of the projections required by paragraph 27(1) to changes in the unemployment rate assumption. The illustrations should reflect the effect of increasing the unemployment rate (1) by

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

approximately one percentage point and (2) to a level sufficient to put stress on the system (e.g., to simulate the largest recession occurring within the last 25 years).

(5) *State-by-State Analysis* - For the UI program provide a state-by-state analysis illustrating the relative solvency of individual state programs. The analysis should provide the ratio of each state's current accumulated fund balance to a year's projected benefit payments based on the highest level of annual benefit payments experienced by that state over the last 20 years.

Transition

28. In instances where data are not available to calculate the actuarial estimates for one or more prior years, as required in paragraph 27(3)(j) the entity may apply the standard prospectively.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

CONSOLIDATED GOVERNMENTWIDE ENTITY ACCOUNTING & REPORTING STANDARD

29. The standard for consolidated governmentwide accounting and reporting for social insurance programs is the same as that for component entities except as provided below. Thus, except for the specific modifications listed below, the governmentwide entity should refer to the relevant paragraphs of the standard for component entities in the preceding section for a description of the information to be provided.

Expense & Liability Recognition

30. Expense and liability recognition for the consolidated governmentwide entity are the same as for the component entities (see pars. 22-23).

Required Supplementary Stewardship Information

31. The consolidated governmentwide financial report should include, as required supplementary stewardship information (RSSI), a summary of the entities' descriptions of their social insurance programs (see paragraph 24). The description should include a discussion of the long-term sustainability and financial conditions of the programs, illustrate and explain the trends revealed in the data, and explain the relationship of the social insurance program(s) to governmentwide financing, especially regarding the intra-governmental nature of trust fund assets and government debt.

32. The information on financial and actuarial status should include the following measures and data:

(1) *Cashflow Projections* -

(a) Cashflow projections should be made for all social insurance programs as described under the component entity standard (see par. 27), except that only cash inflow from the public (that is, excluding interest on intragovernmental borrowing/lending) and total cash outflow are required. At a minimum the OASDI, HI, and SMI programs should be separately

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

identified. The projection period of the display should be based on those used by the component entities, which may require summarization or presentation techniques such as using more than one graph (e.g., a 10-year graph and a 30-year graph). The presentation should include an explanation of material crossover points, if any, where cash outflow exceeds cash inflow and the possible reasons therefore.

(b) For the programs indicated immediately below, estimated future cash inflow (excluding net interest on intergovernmental borrowing/lending) and outflow for the projection period described in paragraph 27 as a percent of

(i) taxable payroll for OASDI and HI, presenting each program separately, and

(ii) GDP for OASDI, HI, and SMI, presenting each program separately.

(2) *Ratio of Contributors to Beneficiaries* - For OASDI and HI, the ratio of the number of contributors to the number of beneficiaries (commonly called the "dependency ratio") during the projection period as described under the standard for component entities (see par. 27(2)).

(3) *Actuarial Present Values* - For all programs except UI provide a statement combining the entity statements required in paragraph 27(3)(a)-(i). The presentation should include data for the current year and separate estimates for each of the four preceding years. At a minimum OASDI, HI, and SMI should be separately identified.

(4) *Sensitivity Analysis* - For all social insurance programs provide a summary of the sensitivity analyses required under the standard for component entities (see par. 27(4)). At a minimum the summary should present the OASDI, HI, SMI, and UI separately.

(5) *State-by-State Analysis* - Provide a summary of the state-by-state analysis

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

required for the UI program (see par. 27(5)).

Transition

33. In instances where data are not available to calculate the actuarial estimates for one or more prior years, as required in paragraph 27(3)(j) the entity may apply the standard prospectively.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

APPENDICES

APPENDIX A -- BASIS FOR CONCLUSIONS

SECTION 1 -- RESPONSE TO COMMENTS RECEIVED

34. This appendix does not constitute authoritative guidance for those who prepare and audit general purpose federal financial reports. It summarizes important matters that the FASAB members considered as they deliberated on this Statement. It includes reasons for accepting certain approaches and rejecting others. Individual Board members gave greater weight to some factors than to others.

35. FASAB published the exposure draft *Accounting for Social Insurance* in February 1998. The exposure draft included five questions and invited comments on the usefulness of the proposal for accounting and reporting for social insurance. Twenty-nine letters were received from the following sources:

	Federal (internal)	Nonfederal (external)	Total
General Public	2 [retired employees]	8	10
Auditors	3	4	7
Preparers and Financial Managers	12	0	12
Total	17	12	29

36. FASAB also held a public hearing on the exposure draft on October 5-6, 1998. Testimony was received from representatives of accounting, auditing, and actuarial organizations; from a public service organization; and from the Social Security and Medicare programs. Appendix C, Historical Background, provides a history of past

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

accounting for these programs.

37. Section 1 of this basis for conclusions addresses certain responses to the exposure draft and the comments received at the public hearing.

38. The responses to the exposure draft illustrate what was described in the basis for conclusions for the exposure draft as two polarized views regarding recognizing or even disclosing a liability measure beyond the due and payable amount called for in this standard. Some respondents restated their views on the propriety of the accounting proposed in the ED, and/or they said they favored one or the other of the two opposing views described in the basis for conclusions. Some respondents argued once again that social insurance programs are pay-as-you-go, income transfer programs for which an estimate of accrued and future benefits and contributions and tax income is inappropriate. Other respondents reiterated the contrary argument. They said that such programs are commitments for which a long-range accrual is not only appropriate but also essential for the balance sheet, if the information presented therein is not to be misleading.

39. The Board continues to believe that the original basis for conclusions in the exposure draft describes and explains the Board's conclusions adequately. Therefore, except for those issues specifically discussed immediately below, the Board is presenting the original basis for conclusions from the exposure draft in Section 2. Changes were made where necessary to reflect the requirement for a statement of social insurance in the final standard.

Expanded Presentation and Visibility of Actuarial Present Values

40. In response to comments received on the exposure draft and subsequent public hearing, the Board is adding a requirement for a statement presenting the actuarial present values (APV) of future benefits for and future contributions and tax income from or on behalf of all current and future participants during the projection period normally used by the programs. For example, the OASDI program uses a 75-year projection period. The net total of the statement will present the total excess of benefits over contributions and tax income.

41. The Board believes that this information will be useful in analyzing the sustainability and financial position of SI programs. The added detail on individual

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

components of the actuarial net present value will provide analysts interested in different facts with useful detail. In addition, the statement presentation will increase the prominence of important data otherwise obscured in a long narrative.

42. The Board has considered whether the changes made regarding the presentation of actuarial present values requires re-exposure. The original exposure draft focused on one net actuarial present value, for the "closed group," while the final standard presents the components of that value as well as data on future participants. Also, the exposure draft proposed subtracting the fund balance at the valuation date from the actuarial present value of the net cash outflow over the projection period, while the standard now calls for fund balance information to be presented in a note to the statement.

43. The Board decided that the new presentation and data did not require re-exposure. The information added to the standard results from adding more detail and modifying the display to increase visibility. These modifications are responsive to the views expressed by many during the comment period. The Board believes that the difference in the presentation does not warrant delaying the issuance of the standard.

Specific Identification of Social Insurance Programs

44. A few of the respondents disagreed with the approach in the exposure draft whereby programs are specifically identified. One respondent reasoned that an accounting standard would be more useful if it established definitive criteria for current and future programs to meet rather than designating only specific programs. Conversely, another respondent said the standard should be even more specific and deal with the individual programs separately because some have characteristics of defined benefit plans while others are similar to welfare programs.

45. After weighing these arguments carefully, the Board continues to believe that definitive criteria would be unworkable. Although these programs do generally share certain characteristics, they are complex. Each program has unique benefits, different eligibility requirements, and different financing arrangements. Because definitive criteria would be subject to interpretation, questions would arise about individuals programs that would require a response from the Board. The Board has decided to identify social insurance programs that now exist and consider the classification of other programs as they may arise in the future.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

Consistency of Assumptions

46. Several respondents to the exposure draft expressed concern that projections of cashflow and GDP would not be consistent between entities and within an entity due to the use of different assumptions by separate programs. One respondent believed that cashflow estimates as a percentage of GDP would not be meaningful without a tremendous amount of effort and cost expended in coordinating assumptions and methodologies to achieve consistency.

47. The Board considered these arguments and decided not to require uniform assumptions. The assumptions used by Social Security and Medicare, the two predominant programs, will be consistent. These programs use the same principal assumptions and have the same **trustees**. On the other hand, the Board concluded that the GDP projection should not be required of smaller programs and therefore explicitly exempts them from that requirement.

Sensitivity Analysis

48. Some respondents disagreed with the approach in the exposure draft regarding sensitivity analysis, which calls for showing the effect of changing one major assumption at a time. One respondent favored a general requirement that entities provide sensitivity analysis rather than telling them how to do it. This respondent favored the high-, low-, and intermediate sets of cost assumptions that are featured in the trustees' annual reports for Social Security and Medicare. Another respondent suggested that the standard not require sensitivity analysis because most users would not understand it and the potential for misuse would be great. Another respondent said that the requirement in the standard was useful because it gives an idea about the uncertainty associated with the estimate. However, this respondent said sensitivity analysis was inadequate without a further discussion of the nature of uncertainty itself and recommended mandating such a discussion.

49. The Board continues to believe that the analysis required by the standard is a clear, easily understood illustration of the sensitivity of projections to changes in assumptions. The Board recognizes the difficulty in illustrating the uncertainty inherent in all projections, especially very long-range projections. However, the

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

requirement in the standard would not preclude the entity from presenting additional discussions of uncertainty and the Board expects that agencies would do so voluntarily.

State and Local Government Pension Accounting

50. Some respondents urged the Board to consider whether the approach used by state and local governments to account for employee pensions would be suitable, at least for some social insurance programs that are most analogous to pensions, such as the retirement benefit portion of Social Security. Those respondents focus on similarities, such as defined benefit formulas tied to earnings.

51. The Board concluded that there are important differences in the programs and environments involved. For example, state and local pension plans typically do not have extensive income transfer features. They are much like federal employee pension programs, which are not considered to be social insurance. On balance the Board concluded that such an approach would be inappropriate.

Vote of Approval

52. This recommended statement was approved by the Board with a vote of 6 members in favor of its issuance and 3 member(s) opposing its issuance. Two members submitted written dissents, which are available for public inspection at the FASAB's offices.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

SECTION 2 -- BASIS FOR CONCLUSIONS FROM THE EXPOSURE DRAFT

[Note: The Board's recommendation differs from the proposal made in the exposure draft. Certain sections from the basis for conclusion in the exposure draft were deleted since they are no longer relevant to the final recommendation. Paragraphs 40-51 explain the differences and reasons therefore.]

53. The following paragraphs address the basis for the Board's proposals on

- defining social insurance,
- recognition of liabilities and expense for social insurance, and
- required supplementary stewardship information (RSSI).

Characteristics of Social Insurance Programs

54. As stated in the introductory sections, the Board has analyzed certain programs that are generally considered social insurance. These programs have certain characteristics that set them apart from general assistance programs on the one hand and insurance programs on the other hand. Accounting standards for liabilities associated with general assistance and insurance programs are provided in SFFAS No. 5, *Accounting for Liabilities of the Federal Government.*

55. After analyzing specific programs, the Board determined that, although these programs generally shared certain characteristics, their operational features were too diverse for establishing definitive criteria that would include all the subject programs and exclude all other federal programs for which accounting standards have already been provided. Thus, the Board has outlined the general characteristics that social insurance programs usually -- but not always -- possess and has listed the specific programs to which the standards apply. This does not preclude the Board from considering an additional program(s) in the future and, given the individual circumstances pertaining to that program, including it within this statement. However, no entity on its own volition should apply this statement to any program not listed in this statement.

56. Accounting for UI for federal employees is provided in SFFAS No. 5 and is not within the scope of this standard. SFFAS No. 5 provides that the unemployment program for federal employees should be accounted for like other postemployment benefits

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

(e.g., severance benefits and workers' compensation) because the nature of the liability is similar. Federal employer entities must reimburse the Labor Department for the full cost of unemployment benefits received by former federal employees rather than paying a payroll tax each period.

Nature of Social Insurance

57. In determining how social insurance program transactions should be recognized in the financial statements and the supplementary information that should be provided about them, the Board considered the nature of the Federal Government, the nature of those programs, and the needs of users of federal financial reports. Statement of Federal Financial Accounting Concepts (SFFAC) No. 1, *Objectives of Federal Financial Reporting*, notes the Federal Government's unique responsibilities for the common defense and general welfare and its unique access to financial resources and financing, including the power to tax and create money. The government undertakes many programs despite potentially unfavorable effects on its financial condition, and transactions between citizens and the government generally are not individual exchanges between willing buyers and sellers.[3]

58. Consideration of guidance for the recognition, measurement, and display of obligations for social insurance programs has continued to present the Board with significant, vexing theoretical and practical problems. The programs are complex, reach a unique order of magnitude, and involve projections that are extremely sensitive to assumptions whose range of possibilities is large.

Expense & Liability Recognition

59. The Board believes that the annual expenses of such programs should be the benefits paid during the accounting period plus any increase (or less any decrease) in the liability from the end of the prior period to the end of the current period, including claims incurred but not reported. The liability should be social insurance benefits due and payable to or on behalf of beneficiaries at the end of the reporting period, and supplementary stewardship information should be provided as described in the standards.

Exchange and Nonexchange Transactions

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

60. During its consideration of social insurance and, before that, of liability accounting, the Board considered whether social insurance programs result in **exchange** or **non-exchange transactions** or whether they contained features of both. As described in Statement of Federal Financial Accounting Standards (SFFAS) No. 5, *Accounting for Liabilities of the Federal Government*, nonexchange transactions give rise to a different kind of obligation than exchange transactions under federal accounting principles.

61. The distinction between exchange and nonexchange transactions is important in determining the point of liability recognition in federal accounting. In an exchange transaction, a liability is recognized when one party receives goods or services in return for a promise to provide money or other resources in the future. However, for a nonexchange transaction, a liability is recognized for any unpaid amounts due and payable as of the reporting date, including estimates of claims incurred but not yet reported.

62. As defined in SFFAS No. 5, obligations become liabilities against the Federal Government in different ways and at different points within transaction cycles that relate to various programs. An important factor in distinguishing the liability recognition point among various federal programs is whether a nonexchange transaction is involved. Although a high probability may exist that a grant, a subsidy, or an income transfer will be made or will continue to be made in future years, the recipients do not have as high an equitable claim to receive grants, subsidies, or transfers in the future as do those who exchange service for promises of future payments. The latter have a greater probability of being paid than the former. At the same time, many people feel that some social insurance benefits, Social Security in particular, also have similar "exchange" or "equitable" claims. They also believe that social insurance benefits have as great a probability of being paid as any other payments.

63. Whether on the balance sheet or elsewhere in the financial report, estimates of the future amounts required to continue present policies regarding such programs are relevant to certain decisions and should be disclosed or otherwise reported. In the context of the Board's definition, however, estimates of future nonexchange payments should not be recognized as a current period liability. On the other hand, any payments due as a result of past events but unpaid at the end of the period constitute

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

a liability.[9]

Polarization

64. With regard to social insurance, the Board notes the strength of feelings on this issue. The Board has been faced with two polarized views. On the one hand there are those who believe a liability should be recognized for the net benefits expected to be paid in future periods to current participants. On the other hand, there are those who believe that the long-term obligation (i.e., beyond amounts due and payable at the end of an accounting period) associated with these programs is not a liability and should not be recognized as such. Some people also believe such amounts should not be reported as RSSI.

Arguments against Recognition, Disclosure, or Supplementary Reporting

65. The latter group would argue that social insurance programs do not result in exchange transactions, that social insurance programs are income transfers financed primarily by compulsory earmarked taxes and also, in certain cases, general revenues of the government. For them, the political nature of the commitment is critical, for its terms can be and are changed by the Congress to maintain **actuarial balance**. In this regard, they point to *Flemming, Secretary of HEW v. Nestor, Part I* (363 U.S. 608-611) wherein Mr. Justice Harlan, delivering the opinion of the Court, said,

> [T]he entire [Social Security System] rests on the legislative judgment that those who in their productive years were functioning members of the economy may justly call upon that economy, in their later years, for protection from the 'rigors of the poor house'...

He continued,

> It is apparent that the noncontractual interest of an employee covered by the Act cannot be soundly analogized to that of the holder of an annuity, whose right to benefits are bottomed on his contractual premium payments.... *To engraft upon the Social Security System a concept of 'accrued property rights' would deprive it of the flexibility and boldness in adjustment to ever-changing conditions which it demands.* (Emphasis added.)

[9] SFFAS No. 5, pars. 129-131.

This is the original Standard file; please check for the most recent update in the FASAB Handbook at www.fasab.gov/pdffiles/handbook_sffas_17.pdf.

66. Those who believe that only the due and payable amount should be recognized as the liability would argue that, under social insurance, the government uses its sovereign power to require payment of taxes that it dedicates to finance benefits. The individual beneficiaries of these programs are receiving payments that may be indirect and disproportionate to the taxes paid by them or on their behalf. In the case of Social Security, the oldest social insurance program, those who retired in the first years after enactment in 1935 received benefits that were many times their taxes. This was possible because the system transfers resources across generations. The system transfers resources within a generation as well, from those working and paying taxes to the disabled, the surviving spouse, and dependent children.

67. They would argue that benefits have also been very different by family type, wage level, and sex. One-earner couples receive benefits that are far larger than taxes paid, followed by two-earner couples. Single females have still lower benefit/tax ratios, followed by single males. Low-wage earners have a higher benefit ratio than those with average or high wages. For each type of recipient, benefit/tax ratios have been trending down. High- and average-earning single males retiring now cannot expect to get their money back, with interest; and this will soon also be true for high-earning single females.[10]

Uncertainty

68. Some of those who do not believe that social insurance obligations constitute a liability argue that the level of future benefit payments is too uncertain for accrual as a liability. They point out that not only did Congress expressly include (and retain) the right to alter, amend, or repeal any provision in the **Social Security Act** itself, it has made such changes frequently. In the early years, the changes generally expanded benefits -- for example, to dependents, the disabled, and early retirees; to a broader coverage of workers; to protect retirees against inflation -- and increased tax rates. But as the system has matured, the changes have increased the tax rate further, taxed an increasing proportion of benefits, reduced cost of living adjustments and various benefit provisions, and prospectively raised the retirement age.

69. They argue further that the benefit payments that might be made in the

[10] See Steuele, C. Eugene, and Jon M. Bakija, *Retooling Social Security for the 21st Century: Right and Wrong Approaches to Reform*, (The Urban Institute Press, Washington, DC).
